Ugh, that case. Nope, neither of them were ever transplanted. NJBI complained about it and when all was said and done, EVERYONE ended up turning down the lungs after MDUM's bronch result, which MDUM says made them non-transplantable (even NJBI, who initially declined the HR based on unavailability of LU). The heart list was exhausted.

Can you double check the NYRT donor ID? I don't see H or LUs being transplanted. I also want to show you what I put together to see if it makes sense before our meeting this week so let me know when you have a minute ☺

Sure!

TXGC: [REDACTED], [REDACTED]
NYRT: [REDACTED]
OHLP: [REDACTED]
OHLB: [REDACTED]

I don't have any in which the HL were allocated correctly—BUT in these cases except for TXGC, the OPOs recognize that the LU are supposed to follow HR, so they created CAPs to ensure it happens. NYRT actually started the process correctly in their case, offering the LU as backup initially. When the first accepting center declined, they made the LU offer primary without realizing there were other HL patients on the list who were now primary. So NYRT at least TRIED to do it right.

Can you send me some donor IDs of the HL not being allocated correctly? Also, not sure if you have any where they were allocated correctly? Trying to get some examples for our meeting next week ☺

Thanks,
