REVENUE ACT OF 1941

FRIDAY, AUGUST 8, 1941

UNITED STATES SENATE,
COMMITTEE ON FINANCE,
Washington, D. C.

The committee met at 10 a. m., pursuant to call, in room 312, Senate Office Building, Senator Walter F. George (chairman) presiding.

The CHAIRMAN. Mr. Secretary, you may proceed as you will.

STATEMENT OF HON. HENRY MORGENTHAU, JR., SECRETARY OF THE TREASURY

The CHAIRMAN. You would not like to have interruptions until you have finished your formal statement?

Secretary MORGENTHAU. That is right.

The CHAIRMAN. The committee will be glad to observe that request. Questions will not be propounded if there are any questions, until after you have finished your formal statement.

You may proceed when you are ready.

Secretary MORGENTHAU. Mr. Chairman, and members of the committee: My purpose in being here today is to discuss taxation as an essential part of national defense. Our great problem in providing for the defense of the Nation is fundamentally the problem of production—of actually building planes and tanks, ships, and guns with labor, management, machinery, and raw materials. To solve that problem without impairing our economy or weakening the structure of democracy, our fiscal policy must be adapted to the needs of the times.

On April 24 I discussed with the Ways and Means Committee of the House the need of producing $3,500,000,000 annually in additional revenue. The Treasury Department presented a suggested program for raising that amount of money. As it passed the House, this bill will produce approximately $3,200,000,000 annually in additional revenue. In my opinion, it is very important that the revenue yield be raised to at least the original $3,500,000,000 level. It is also important that the bill be passed as promptly as possible. Income taxpayers and excess-profits taxpayers should know as quickly as possible what their taxes on 1941 income and profits are going to be, since more than 7 months of the year have already elapsed. The excise taxes and the estate tax cannot be imposed retroactively and every day's delay in the passage of this tax bill costs the Treasury several million dollars in revenue from those sources.

The rapid developments of the last few months have made this bill inadequate even before it is passed. Since my statement before the Ways and Means Committee, many things have happened. Two and one-half months ago the President proclaimed the existence of an unlimited national emergency. He called upon—

all loyal citizens to place the Nation's needs first in mind and in action to the end that we may mobilize and have ready for instant defensive use all of the physical power, all of the moral strength, and all of the natural resources of this Nation.

Since I appeared before the Ways and Means Committee, the amount of appropriations, authorizations, and recommendations over and above the Budget has increased by about $14,000,000,000, thus completely changing the fiscal picture and greatly increasing the need for revenue.

Since I appeared before the Ways and Means Committee, prices and the cost of living have increased at an accelerated rate, thereby accentuating the need for a strong fiscal program.

In the light of these and other developments resulting from all-out defense, I should like to point out what, in my opinion, will be necessary in all-out taxation to support such a program.

First of all, we shall need more revenue—much more revenue. The defense program is an absolute necessity. It must be paid for. Insofar as possible, it should be paid for now. Borrowing should be kept to a minimum to maintain our fiscal strength. The rise in the Federal debt means merely that the taxpayer's burden is being postponed—that both principal and interest must be paid later out of higher taxes collected at a time when they may be harder to pay and less willingly paid than now.

Along with increased taxation should go the maximum reduction in the ordinary nondefense expenditures of Government. The burden of paying for defense is so heavy that it should be relieved at every possible point.

Increased taxation is needed also to maintain economic stability. Rising purchasing power is exerting increasing pressure on the prices of many kinds of goods, while at the same time production of these goods is being increasingly curtailed by the necessity of diverting our resources to defense uses. This complication of increased demand and restricted output is causing inflationary price rises which threaten to increase the cost of the defense program, unbalance family budgets and seriously disturb our economic life.

This larger needed revenue should come from all sources where there is ability to pay—that's what an "all out" tax program means. The people of this country have never been more ready to make sacrifices for the common good. Our tax program has not kept pace with the defense program. We are still thinking too much of helping this group or that to escape its share of the burden. We have now come to the point where it is a matter not merely of fundamental equity, but of the utmost necessity that all exemptions from taxation be reduced to the absolute minimum.

An "all out" tax program for defense should reach ability to pay at several points not now fully tapped:

1. In my opinion such a tax program might well involve a substantial lowering of personal exemptions and a consequent broadening of the base of the income tax, if simultaneously we take immediate steps to remedy defects in the application of the principle of ability to pay in other parts of the tax structure. Under the bill before you, the base has been broadened to add about 2,500,000 new taxpayers, but even so there will remain a relatively large proportion of the population in the lower income groups which will not be directly affected by the income tax. A further lowering of the exemptions would produce some additional revenue and in addition it would give millions of Americans an opportunity—a welcome opportunity—to

make a direct contribution through taxes to the defense of their country. It would enable them to feel that they were participating personally and directly in the defense program. As the President wrote to Chairman Doughton on July 31:

> Most Americans who are in the lowest income brackets are willing and proud to chip in directly even if their individual contributions are very small in terms of dollars.

But I believe this committee will agree with me that we ought not to accept such sacrifices, even though willing sacrifices, from millions of people with low incomes on whom the burden of other types of taxes falls most heavily, unless we reach in other places ability to pay which is escaping its fair share of taxes. Among these are the following:

2. The excess-profits tax exempts profits of even the most prosperous corporation, except to the extent that such profits are in excess of its average profits for the years 1936–39. Surely Congress will not wish to impose additional taxes on millions more of our low-income group, unless it also imposes the excess profits tax on the exempt excess profits of such corporations.

3. Families pay lower Federal income taxes when both husband and wife receive incomes than when the same total amount of income is received by only one of them. This is a discrimination of which many wealthy people have taken advantage by large gifts of income-producing property between husband and wife.

Furthermore, in at least eight States of the Union, Federal income taxes are made substantially lower than in the remaining States because the local law permits the splitting of income between husbands and wives. Here are discriminations against the rest of the taxpayers which, I believe your committee will agree, must be eliminated if we are to extend the income tax downward to include millions of persons with low incomes. The discriminations can be eliminated by requiring husband and wife to file a single joint return with appropriate relief granted only where both husband and wife work outside the home.

Senator WALSH. Is that your own quotation or the quotation of the President?

Secretary MORGENTHAU. I am sorry, but I do not understand.

Senator WALSH. Up to where you read.

Secretary MORGENTHAU. I will go back to the President's quotation. It goes down to—

> Most Americans who are in the lowest income brackets are willing and proud to chip in directly, even if their individual contributions are very small in terms of dollars.

Senator WALSH. Excuse the interruption.

Secretary MORGENTHAU. I am glad you interrupted. The rest is mine.

4. For years, the concerns engaged in extracting certain of our natural resources, notably oil, have been granted far greater allowances for depletion than can be justified on any reasonable basis of tax equity. If the income tax is to be extended to lower incomes, this privilege of tax escape should simultaneously be removed.

5. A few months ago the Congress eliminated the tax-exemption privilege from new issues of Federal Securities. The purchasers of

new State and local securities still enjoy this exemption. The exemption was inequitable and expensive even in more normal times. It cannot be borne longer in a time like this, and especially if we are to increase the direct tax burdens of persons with small incomes.

6. In its suggestions to the Ways and Means Committee the Treasury recommended substantial increases in estate and gift taxes and lower exemptions. In part, this recommendation was followed but in my opinion, the estate and gift taxes should reach more estates and provide more revenue if we are going to tax smaller incomes.

Those are some of the things that I mean when I say that an "all-out" tax program for defense must go far beyond the present bill.

There is another condition which I would attach to lowering the personal exemptions. I think we ought not to take into the income tax system millions of new taxpayers with small incomes without simplifying the way in which their tax is computed.

Take, for example, a single person with a $900 salary. Under the present law, he first figures out what deductions he has—taxes paid, interest paid, contributions, and so on. Then he computes his earned income credit. Then he subtracts his personal exemptions from his income after deductions. On the balance, under rates of the bill before you, he computes a surtax of 5 percent. Then he goes back to the income and deducts his earned income credit. On the balance, he computes a normal tax at 4 percent. He then adds the normal tax and the surtax and takes 10 percent of the total for defense tax. He adds the defense tax to the normal tax and surtax and finally arrives at his income tax.

Senator BARKLEY. That is partly due to the fact that the experts have written most of these bills.

Secretary MORGENTHAU. That is right. If they left it to you and me, it would be different.

Senator LA FOLLETTE. I think it is hardly fair, if I may interject, to the experts. They did not invent this 10-percent defense tax.

Senator VANDENBERG. It is hardly fair to the Secretary, because he is supposed to be an expert, too.

Senator BARKLEY. No member of the committee will lay claim to such distinction.

Secretary MORGENTHAU. I am sure Senator Vandenberg will.

Senator VANDENBERG. I will not.

Secretary MORGENTHAU. When he started to fill out his return, he may have been full of patriotic enthusiasm to pay his share toward the defense program, but by the time he has finished his last computation his cheerfulness may well have collapsed under the strain. It is difficult enough for persons with substantial incomes who are used to dealing with financial papers and who can afford high-priced lawyers and accountants to make their computations for them. The person with a small income should not be put to this annoyance and possible expense.

Furthermore, the checking of these tax computations by the administrative authorities takes time. Frequent errors are found which must be rectified, requiring correspondence and further annoyance of the taxpayer as well as expense to the Government. We in the Treasury do not enjoy pestering the taxpayer any more than he enjoys being pestered by us.

For taxpayers with relatively large incomes, refinements in determining income and computing taxes are troublesome but are necessary in the interest of equity. For small taxpayers, however, especially

those now taxed for the first time, these refinements are cumbersome and confusing without serving any important purpose. The income taxes of millions of people can be determined with acceptable accuracy by less involved methods.

As the President suggested to Chairman Doughton, there should be a provision in the case of the small taxpayer—

for a straight, simple payment of some small contribution to the national tax income through a simple agency and on a simple form.

For such taxpayers a plain and easily understood table could be provided with the aid of which the small taxpayer could compute his tax bill in a very few moments. He would be spared time, trouble, and annoyance and the Government would be spared expense.

To indicate more clearly what I have in mind, I have had prepared a sample table showing how this might be worked out in practice for incomes up to $3,000. This is only a preliminary table and improvements and changes will no doubt be desirable, but it will illustrate how the proposal can be applied.

I have furnished each of you gentlemen with this table.

(The table referred to is as follows:)

KNOW YOUR TAXES

Illustrative schedule of Federal income taxes for individuals with total incomes of less than $3,000

SCHEDULE A

If your total income is—		Your tax is—		If your total income is—		Your tax is—		If your total income is—		Your tax is—	
From—	To—	Single person [1]	Married person [1]	From—	To—	Single person [1]	Married person [1]	From—	To—	Single person [1]	Married person [1]
$1	$750	.....	.....	$1,501	$1,525	$62	$1	$2,251	$2,275	$126	$59

1,476	1,500	60	.....								

[1] For each dependent, subtract $400 from your total income and use the balance to determine your tax.

NOTE.—The taxes in the above schedule, which is purely illustrative, were calculated on the following assumptions: Personal exemption for single person, $750 and for married persons, $1,500; rates the same as in H. R. 5417; tax for each income block is the average of the tax on the lower and upper limit of the block, reduced by 10 percent as a rough equivalent for deductions from income; and the tax is shown to the nearest dollar.

Secretary MORGENTHAU. The idea is this: This is put up in every post office and every public building. A man can just look down here and if his income is $1,001, he pays $19, and if it is $1,026, he pays $22; if you lower the exemptions and get an additional 5,000,000 return filers, we feel that some such plan as this will make it so that they can make their income-tax statements very readily.

Senator WALSH. This does away with all questions?

Secretary MORGENTHAU. Yes.

Senator WALSH. So he would just know from looking at this plan what he has to pay?

Secretary MORGENTHAU. Yes; just what he has to pay.

Senator BARKLEY. How can that be true, Mr. Secretary? Because each individual may have different amounts of deductions which are not figured in this tax.

Secretary MORGENTHAU. Well, we have the form which will go on the other side of this, which accompanies this specimen tax return.

Senator WALSH. Have you thought of the system of just asking the small taxpayers a series of questions and let the Treasury make out the computation?

Secretary MORGENTHAU. We can do that. We think with the help of you gentlemen, something like this can be proposed, with a very simple form that we have.

The CHAIRMAN. We will wait until you finish.

Secretary MORGENTHAU. Shall I wait until I finish?

The CHAIRMAN. I think, Mr. Secretary, it would be better if we wait until you finish your formal statement.

Secretary MORGENTHAU. We think it would be possible for a man to make out his income-tax statement in about 5 minutes without the help of anybody other than maybe the postmaster or some representative of the Treasury, without having to hire a lawyer and an accountant, and it would make the people a great deal happier about it, and it would take care of about 90 percent of the income-tax people that way.

The taxes imposed by the bill before you are very heavy; the taxes of an all-out program would be even heavier. I am convinced that the people are not opposed to heavy taxes, that in fact they favor heavy taxes because they know that the alternatives are much more onerous. At a time when expanding incomes are operating to force prices upward many kinds of measures must be employed if prices are to be kept under control. Without heavy taxation, the other measures have little chance to succeed.

Rising prices would take much more away from our people now and in the future than higher taxes now will take. Under the tax bill in its present form, a married couple with no dependents, having a net income of $5,000 a year, will have its Federal income tax increased by $198 or 4 percent of its income. Assuming that two-thirds of the family's income is spent on items affected by a changing cost of living, an increase in the cost of living of 6 percent would impose as great an additional burden on this family as would the proposed income tax. The cost of living index has increased 5½ percent since September 1940. It is clear from this simple illustration that rising prices tax the family income just as surely as do income taxes. Although, as prices rise, the income of some families will increase, many incomes will not increase and most incomes will not increase as fast or as much as prices.

If, in an attempt to protect the incomes of our people, we hold down taxes and as a result, the cost of living rises, we shall have taxed them just as surely as if we had levied on them directly—and we shall still have the inflated costs of defense to pay later from taxes.

An all-out tax program will build public morale in an all-out defense program. By reducing the necessity for borrowing, it will strengthen confidence in the impregnable fiscal position of the Government. By contributing to the control of prices, it will help prevent the demoralization which would result from inflation. By distributing the defense burden fairly, it will help unite the Nation. It will make all the people equal partners in sharing the cost of the defense of our country.

The CHAIRMAN. Senator Walsh, do you wish to ask the Secretary any questions?

Senator WALSH. Mr. Secretary, does the Treasury Department recommend the excess-profits-tax provisions of the House bill?

Secretary MORGENTHAU. Not as they passed the House.

Senator WALSH. Are you going to submit to the committee a substitute form of levying excess-profits taxes?

Secretary MORGENTHAU. We will be glad to if we are asked to.

Senator WALSH. You have such a plan?

Secretary MORGENTHAU. We have such a plan.

Senator WALSH. I do not care to ask any more questions now.

The CHAIRMAN. Senator La Follette?

Senator LA FOLLETTE. I think not.

The CHAIRMAN. Senator Barkley?

Senator BARKLEY. Mr. Secretary, you comment here on the joint return made by husband and wife and I gather from your statement that you still advocate the compulsory joint return by husband and wife as first carried in the House bill.

Secretary MORGENTHAU. With the one slight proviso that I added.

Senator BARKLEY. You take the position that the base is to be lowered among the lower-income taxpayers in the country and that this joint return ought to be included?

Secretary MORGENTHAU. That is right.

Senator BARKLEY. Are they necessarily connected?

Secretary MORGENTHAU. No.

Senator BARKLEY. In the letter of the President to Mr. Doughton, he urged the elimination of the joint return; did he not?

Secretary MORGENTHAU. No. Has somebody got his letter? I did not mean to be so contradictory.

The CHAIRMAN. He urged the liberalization of the joint return, by a liberal treatment of the earned income of the two.

Senator WALSH. The committee has the letter before them.

The CHAIRMAN. We have it here, Mr. Secretary. Would you like to have it?

Secretary MORGENTHAU. Thank you. I have a copy of it.

Senator BARKLEY. Of course, it is generally estimated that without the joint return it results in a loss of some $300,000,000.

Secretary MORGENTHAU. Would you mind, Senator, if I just read a paragraph from the President's letter?

Senator BARKLEY. No; go ahead.

Secretary MORGENTHAU. I am reading from the President's letter:

I am sure that I make it clear that the Treasury Department does not approve of mandatory joint tax returns except on the condition of granting substantial

relief to earned income of husband and wife. In this I heartily concur. But the committee draft leaves out the proviso altogether.

In other words, we were for the mandatory joint tax returns with the proviso and the President backed us up in that position.

Senator BARKLEY. Were the terms of the liberalization or the details of it set up by the Treasury?

Secretary MORGENTHAU. We presented them before the Ways and Means Committee.

Senator BARKLEY. Frankly, I have not been enthusiastic about the joint tax return, whether mandatory, or whether it carried a provision such as you susggest for this reason, and I would like to get your reaction to this; in nearly all the States over a period of years the legislatures have liberalized the laws with respect to separate ownership of property and rights of women in the control and ownership of property. In other words, all the States, through their laws, in the last generation, have constantly sought to free women from the domination of the husband in the control and ownership of her property. Now, I have felt and I feel yet that this provision, especially as it was carried in the House bill, before the House eliminated it, and I am not so sure that it would not, even under your suggestion, have a tendency to break down that independence and that liberalization of the State law with respect to the ownership of property by women and the control of property by women independent of their husbands, which has been the object of nearly all legislation in the past 35 or 40 years. What is your view about that?

Secretary MORGENTHAU. Unfortunately, a great many wealthy people have taken advantage of that, the men have transferred their property to the women in order to escape paying their fair share of the taxes, with the result, we estimate, that if that privilege were taken away, the Treasury would gain about $258,000,000. The privilege which has been extended to them over this time, as I say, has been abused.

Senator LA FOLLETTE. May I interrupt there, Senator?

Senator BARKLEY. Yes.

Senator LA FOLLETTE. Have you any estimate, Mr. Secretary, on what percentage of the present income taxpayers would be asked to pay the additional revenue? If you or Mr. Sullivan could answer that, I would appreciate it.

Secretary MORGENTHAU. I hear Mr. Sullivan saying he has got it, so let him answer that.

Mr. SULLIVAN (John L. Sullivan, Assistant Secretary of the Treasury). Exclusive of some 45,000 filing community property returns, the last available figures were about 153,000 men and 153,000 women filing separate tax returns on calendar year 1938 incomes.

Senator LA FOLLETTE. Out of a total of how many, approximately, for the record?

Mr. SULLIVAN. The husbands and wives filing joint returns, I believe, totaled 2,866,000 of which 1,038,000 were taxable returns.

The CHAIRMAN. Mr. Sullivan, could you compile any figures to indicate how much the estimated revenue would be reduced by an allowance of the earned income, or by an application of the earned income?

Mr. SULLIVAN. Yes, sir. We estimate that the mandatory joint return originally provided in H. R. 5417 would yield $287,200,000. The figure of $258,000,000 given by the Secretary is the additional yield

from mandatory joint tax returns at the rates of tax contained in H. R. 5417 if the earned-income credit he recommends is allowed.

The CHAIRMAN. $258,000,000?

Mr. SULLIVAN. That is correct, sir.

The CHAIRMAN. Now, may I ask you if you have any additional figures—I apprehend it would be rather difficult to be anything like accurate—if there were also exempted from the joint tax return property possessed by either the husband or wife at the time of marriage? Would it be possible to get a reasonable estimate?

Mr. SULLIVAN. We do not have that figure, sir. It will be pretty difficult to get a basis for that estimate.

Senator BARKLEY. May I ask this? The Secretary has referred to the fact that many wealthy people escape the payment of taxes by transfer of property to wives. Of course, that only involves the income of such property and in that case, the wife would make an independent return on the property that was owned by the husband.

Mr. SULLIVAN. That is correct, Senator Barkley. The return of income which each would make, would fall into lower brackets of surtax than if a joint return were filed and would therefore be subject to a much lower surtax.

Senator BARKLEY. How much in revenue has the Treasury lost by the transfer of property from wealthy husbands to their wives?

Mr. SULLIVAN. I think, from 1932 through 1939, there has been transferred by gifts reported for gift tax purposes $5,000,000,000, but we have no way of telling how much of that was from one spouse to another, or what additional gifts were made that were not subject to gift taxation.

Senator BARKLEY. Do you know what the income on that transferred property was?

Mr. SULLIVAN. We have no way of knowing that, sir.

Senator BARKLEY. The tax lost to the Treasury would depend on the income of this $5,000,000,000 worth of property?

Mr. SULLIVAN. That is right and the bracket in which the holders of the property were placed.

Senator BARKLEY. Would you estimate the difference between what the wife would pay on that transferred property and what the husband and wife would pay if they were compelled to make a joint return?

Mr. SULLIVAN. We have no way of estimating that, sir, but as I testified a few moments ago we estimate that the Treasury proposal for mandatory joint returns would yield $258,000,000 a year.

Senator CLARK. They would have to pay the gift tax at the time of the transfer.

Mr. SULLIVAN. That is right. The gift tax rates are three-fourths of the estate tax rates, Senator Clark.

Senator BARKLEY. Is it your contention that all of the 153,000 families would be affected by this change in the transfer of property back and forth between husband and wife?

Mr. SULLIVAN. No; that is not correct, sir.

Senator BARKLEY. How many of them would you say have escaped taxes by that method?

Mr. SULLIVAN. I cannot give you that offhand.

Senator BARKLEY. So, regardless of any transfers, regardless of whether they are wealthy or not, 153,000 is the number of those who would be affected by the provisions of the House bill if it was mandatory?

Mr. SULLIVAN. I think it would be a little bit more this year, Senator. Probably about 215,000 families would file separate and community property returns under existing law.

Senator BARKLEY. While I am asking questions—I do not want to take too much time—I wanted to ask the Secretary if he has any estimate on the total national income for 1941?

Secretary MORGENTHAU. Our men estimate somewhere between 88 and 90 billion dollars.

Senator BARKLEY. That is 10 or 12 billion dollars more than for 1940, isn't it? The 1940 income was some $76,000,000,000.

Secretary MORGENTHAU. Yes. That is correct, Senator Barkley. They say right now it is running at the rate of $88,000,000,000, but my men think that before the year is over, it will be over $90,000,000,000.

Senator BARKLEY. My recollection is that the total income for 1940 was about $76,000,000,000 and if it is estimated for 1941, it will be $90,000,000,000, that means an increase of $14,000,000,000.

Secretary MORGENTHAU. That is right.

Senator BARKLEY. In the total income.

Secretary MORGENAHAU. That is right.

Senator BARKLEY. Now the point in my mind is this, to try to reach the source of that $14,000,000,000 increase in income.

Secretary MORGENTHAU. Yes.

Senator BARKLEY. Now, to what extent has that $14,000,000,000 increase been distributed among the low-income taxpayers who would be affected by a lowering of the base?

Secretary MORGENTHAU. This is just my own opinion, without consulting anybody—I do not think it has had time to get down to most of the really low-income people yet.

Senator BARKLEY. So that any tax bill that increases the tax of the low income brackets, who have not participated as yet in this increase of $14,000,000,000 would be, of course, an additional burden upon them, who have not been compensated by the increase which we are talking about, is that true?

Secretary MORGENTHAU. As I say, I haven't got the exact figures. It takes quite a while for this increase of national income to reach the people at the bottom of the ladder.

Senator BARKLEY. The 3½ billion dollars that this bill is supposed to raise over and above present taxes then, is only about one-fourth of the total increase in the national income?

Secretary MORGENTHAU. Yes.

Senator BARKLEY. It seems to me that if there is any way to arrive at levying this tax where the increased income is going to benefit people, it ought to be done, instead of assuming that the $14,000,000,000 increase is being spread out over the whole population and therefore, we would be justified in taxing the small-salaried man who does not now pay an income tax or who does not pay as much as he would before any increased schedule.

Secretary MORGENTHAU. Eventually it will reach everybody in proportion to his earning power.

Senator BARKLEY. Well, it will not reach the salaried man unless his salary is increased by reason of increased income.

Secretary MORGENTHAU. Yes; it will hit him the hardest.

Senator BARKLEY. It will not reach him at all, if the price of his living expenses is to go up without any increase in his income.

Secretary MORGENTHAU. That is right.

Senator WALSH. Is there any better way of reaching a portion of that increased income than through the excess profits tax?

Secretary MORGENTHAU. I do not know any at the moment, I mean other than these six suggestions which I made here today.

Senator BARKLEY. Do not you think that people who are not engaged in defense work and whose profits are not to be increased, even indirectly, by the defense program, ought to bear their share of this burden, as well as everybody else? In other words, the tax ought not to be limited simply to those who are making direct profits out of defense activities? The general increase in income to some extent, benefits a lot of people who have no contract with the Government, who are not engaged in the manufacture of defense articles.

Secretary MORGENTHAU. That is right.

Senator BARKLEY. And any tax based simply upon an increase growing out of defense contracts might let a lot of people escape who will share in this increased income?

Secretary MORGENTHAU. That is perfectly right.

Senator CONNALLY. May I ask him some questions? Is it my turn now?

The CHAIRMAN. Yes. There is no particular order in which the committee members may ask questions.

Senator CONNALLY. Somebody suggested you were going down the line. I am willing to accept my humble place when it is reached.

Mr. Secretary, I am sorry I was not here when you started.

Secretary MORGENTHAU. I am sorry, too.

Senator CONNALLY. I hope to be here when you end.

Secretary MORGENTHAU. Are you participating in my end?

Senator CONNALLY. Well, if it is the right end, I will.

Secretary MORGENTHAU. Thank you.

Senator CONNALLY. I noticed you were on page 8 and then Mr. Sullivan was reaching his climax on it when I came in, about the joint-income return. He said something about billions of dollars of property had been transferred in recent years from husband to wife, ostensibly to evade the payment of a heavier tax. I suppose that was your implication, was it not, Mr. Sullivan?

Mr. SULLIVAN. The question was, How much property had been transferred?

Senator CONNALLY. I see here you say:

> Furthermore, in at least eight States of the Union, Federal income taxes are made substantially lower than in the remaining States because the local law permits the splitting of income between husbands and wives.

Have you any reason to believe that a State like mine, that adopted the community property as early as 1840, had in mind the avoidance of a tax in 1941 by the adoption of the community-property rule?

Secretary MORGENTHAU. I doubt whether they were that farsighted.

Senator CONNALLY. Well, if they had known who was running the Treasury in 1940, they might have been that farsighted.

What I am talking about is, you seek to pick out eight States here and make them more or less the goat and credit them with putting the idea in these rich States like your own of swapping back and forth to avoid taxes. As a matter of fact, the community-property rule was more or less an inheritance from the Roman law, the civil law,

and these eight States that have it were originally, most of them, parts of Mexico. My own State, when it was a free republic—it was not even part of the Union, and therefore was not looking forward, maybe at that time, to ever being a part of the Union; and while we are on that, we have had reason several times to doubt whether we ought to have joined or not—but still the point I am trying to make is this, that this was a domestic social policy that our people adopted in 1840 to give the wife half the income. It ought to be the law everywhere. If a man and wife get married the wife ought to be allowed something more than food, clothing, and a place to sleep. So there is no theory at all here that we adopted any policy such as this in the community property States to evade taxes, and the Federal Government has no right, through the pressure—the indirect pressure of a tax—to cause us to change or modify or alter our own laws that we have had from time immemorial. Now, if these parties are transferring their properties to evade taxes, as suggested by Mr. Sullivan, maybe we ought to raise the gift tax and provide that if a husband gives his wife part of his estate, he should pay a higher rate, or vice versa.

I hope it does not apply to the men giving the wives part of their property or the wives giving the husbands part of their property without any intention of evading the tax.

Secretary MORGENTHAU. May I interrupt you for one moment?

Senator CONNALLY. I want to add to that. I just resent the implication here that we people who adopted this rule 100 years ago are trying to evade some tax.

Secretary MORGENTHAU. May I interrupt?

Senator CONNALLY. Yes.

Secretary MORGENTHAU. On this page 8, in paragraph 3, you notice I say—

families pay lower Federal income taxes when both husband and wife receive income than when the same total amount of income is received by only one of them.

Senator CONNALLY. There is no tax on families. There is a general tax on individual incomes but you do not tax families.

Secretary MORGENTHAU. This reads:

This is a discrimination of which many wealthy people have taken advantage by large gifts of income-producing property between husband and wife.

We are not talking about the eight States. Then I go on:

Furthermore, in at least eight States of the Union—

and so forth.

Senator CONNALLY. Yes.

Secretary MORGENTHAU. So that the one thing is applicable to the present law, where you can file separately or jointly.

Then I go on talking about the eight States there. Furthermore, it breaks the thing into two thoughts.

Senator CONNALLY. I read the whole statement. That is all, Mr. Chairman.

The CHAIRMAN. Senator Capper, do you wish to ask any questions?

Senator CAPPER. No.

The CHAIRMAN. Senator Vandenberg?

Senator VANDENBERG. Mr. Secretary, I want to see if I can get at just one figure for comparative purposes. I think it might be instruc-

tive to the country. You put great emphasis on the necessity for an "all-out" tax program in connection with an "all-out" defense program.

Secretary MORGENTHAU. That is right.

Senator VANDENBERG. At that original meeting in your office in April, I think—which was a very historic one for me, because that is the only one I have ever been permitted to look in at—my recollection is you said the protection of public credit required inescapably that we should go on a one-third, two-thirds basis, in other words, that we should pay two-thirds of our operating governmental costs. My recollection is you said you would be a little doubtful about what would happen to the public credit if we did not go on a two-thirds pay-as-you-go basis. Is that correct?

Senator MORGENTHAU. Yes.

Senator VANDENBERG. Well, at that time, the Budget was $19,000,000,000 and the revenue was $9,000,000,000. You estimated the necessary new revenue at $4,000,000,000 in order to produce $13,000,000,000 and that should be on a two-thirds pay-as-you-go basis.

Secretary MORGENTHAU. Yes.

Senator VANDENBERG. What would this bill have to raise if we were to still maintain our belief in your proposition that the public-credit protection requires a two-thirds, pay-as-you-go basis?

Secretary MORGENTHAU. Can I ask Mr. Bell out loud, so you may participate in whatever wisdom he has?

Senator VANDENBERG. Yes.

Secretary MORGENTHAU. As I understand it, Mr. Bell, the last official figure we have from the Budget is that they are going to ask for this fiscal year's expenditures, $22,000,000,000?

Mr. BELL (D. W. Bell, Under Secretary of the Treasury). That is right.

Secretary MORGENTHAU. How much do they figure the revenue to be?

Mr. BELL. Nine and four-tenths billions.

Secretary MORGENTHAU. That would leave a deficit of how much?

Mr. BELL. Twelve and eight-tenths billions. In order to raise two-thirds of the expenditures by revenue you would have to have about $15,000,000,000, so that the increase of the taxes over the present tax structure would be about five and six-tenths billion.

Secretary MORGENTHAU. Including this bill?

Mr. BELL. Yes.

Secretary MORGENTHAU. You mean another five billion on top of the three and five-tenths billion?

Mr. BELL. No, sir; on top of the revenue we are now getting under the present tax law.

Secretary MORGENTHAU. How much on top of the three and five-tenths billion?

Mr. BELL. About two billion.

Secretary MORGENTHAU. Figuring three and five-tenths billion, how much more—one and five-tenths billion?

Mr. BELL. I figure two billion more.

Senator VANDENBERG. I did not mean to stall the machinery.

Secretary MORGENTHAU. The answer to your question is, if we had another meeting in our office and you would be gracious enough to

come, under present conditions, we would tell you we would need another $2,000,000,000 in taxes.

Senator VANDENBERG. Your statement on page 3 says that $14,000,000,000 has been added to the Budget since our original meeting, and if that is true, since you originally estimated it at $19,000,000,000, the total now would be $33,000,000,000.

Secretary MORGENTHAU. If you will just take a moment, it is appropriations, authorizations, and recommendations.

Mr. BELL. Not expense.

Senator VANDENBERG. Yes.

Secretary MORGENTHAU. We can only go by the Budget figure of what is going to be spent, and the most recent figure is $22,000,000,000.

Senator VANDENBERG. So the answer to my question is, if we were to cling to your two-thirds as-you-go formula, we would have to raise $2,000,000,000 more than this bill raises?

Secretary MORGENTHAU. $2,000,000,000 on top of the $3,500,000,000.

Senator VANDENBERG. That is what I mean.

Secretary MORGENTHAU. Yes.

Senator VANDENBERG. I want to ask about just one other thing in connection with your national income, which you say is now $88,000,000,000 and which your experts contemplate will rise to $90,000,000,000.

Secretary MORGENTHAU. Yes.

Senator VANDENBERG. To what extent does that take into account the decimation of little business, with the priorities handicap that little business is now suffering from?

Secretary MORGENTHAU. I could not answer that. Those figures on national income are computed by the Department of Commerce. We just take the figures from them; that is all. I do not know how to answer your question.

Senator VANDENBERG. Do not you feel that the operation of priorities is going to seriously upset all of your estimates?

Secretary MORGENTHAU. I would not know how to answer that question.

Senator VANDENBERG. That is all.

Senator LA FOLLETTE. I think the record ought to show it was stated here yesterday, insofar as the Treasury is capable of doing so, they have allowed for dissemination of priorities in their estimates of income. Of course, that is a very difficult task, since nobody knows exactly the extent of it, although I think everybody who knows anything about it recognizes it should be very great.

Mr. SULLIVAN. That is true, Senator La Follette, insofar as the estimate we have given on tax revenues as distinguished from national income.

Senator LA FOLLETTE. That is what I am talking about.

Mr. SULLIVAN. Yes.

Senator GERRY. How about the revenues from the increased national income?

Secretary MORGENTHAU. Mr. Sullivan, will you answer that?

Mr. SULLIVAN. I will ask Mr. O'Donnell to answer that.

Mr. O'DONNELL (Al F. O'Donnell, Assistant Director of Research and Statistics, Treasury Department). Of course, we do not estimate revenues from the national income, Senator Gerry. In each instance

where you pass a law, the Congress defines each specific base upon which a tax is levied. For instance, in the case of automobiles, we tax the value of automobiles sold by the manufacturers, and therefore it becomes our problem to estimate the value of the automobiles which will be produced. When we made our Budget estimates, for instance, last December, we were faced with production for the 1941 model automobile year of something like 5¼ million passenger cars and trucks, of which perhaps 4.2 million would be passenger cars.

Now, in making our estimates of revenues for fiscal year 1942 last December we saw ahead to this problem of priorities, that Senator Vandenberg has mentioned. We thought that the automobile industry was going to be one of those industries most seriously hurt, and in figuring our Budget estimate of revenue from the manufacturers' excise tax on passenger automobiles, we cut down the estimated value of production to something like the equivalent of 3,100,000 passenger automobiles on which taxes would be collected in fiscal year 1942. Now, even today, 8 months after it was made, this estimate is not materially out of line with the projected plans for the automobile industry.

Thus, Senator Gerry, even though we expected higher levels of national income in fiscal year 1942 than in the preceding fiscal year, the estimate of the anticipated revenues from this particular tax were lowered to take into account anticipated priorities.

Now, it is in that sense that I say we tried to anticipate what is going to happen.

Senator VANDENBERG. May I ask you, in connection with that particular exhibit——

Mr. O'DONNELL. Yes, sir.

Senator VANDENBERG. Do you carry your conception down into the dislocation throughout the country among all the dealers of automobiles?

Mr. O'DONNELL. We try to do that, sir, particularly when we estimate the yield of the income taxes. We take into consideration the fact that we will no longer get a normal relationship between the statistical indices which we look to to indicate corporate and individual incomes. The indexes will not indicate the relationships which prevailed in normal times, and we do try to make allowances for that fact.

Senator VANDENBERG. My observation, in my own State, at least, is that small business is going to the wall pretty rapidly under the pressure of priorities. In fact, I think the priority proposition is probably going to be more dangerous in the next 6 months than even Mr. Hitler is.

The CHAIRMAN. Senator Bailey, do you desire to ask any questions?

Senator BAILEY. I would like to have some suggestion by the Secretary on this point: You want 3.5 billion dollars of revenue in addition to the present revenue?

Secretary MORGENTHAU. Very much so.

Senator BAILEY. What would be the total revenue then?

Secretary MORGENTHAU. About 12.7 billion or 12.8 billion dollars.

Senator BAILEY. It would be from 12 to 12.5 billion general revenue to the Federal Treasury if this bill passes and we jack it up 3.5 billion. To what extent could you relieve the very bad situation which you portray here by reducing the nondefense expenditures, just assuming that the Congress would do so?

Secretary MORGENTHAU. Well, to whatever amount the Congress reduces it, it makes the gross expenditures of the Federal Government that much less and it makes the fiscal picture look that much better.

Senator BAILEY. Is not that really a logical way out of the situation?

Secretary MORGENTHAU. I think it is one of the ways. I still think we ought to have our 3.5 billion.

Senator BAILEY. The 3.5 billion is for defense purposes?

Secretary MORGENTHAU. Yes.

Senator BAILEY. Suppose we could reduce the nondefense expenditures by 2 billions, you would not need your 3.5 billions to any such degree as you now need it, at any rate?

Secretary MORGENTHAU. I am sorry, but I did not get the question.

Senator BAILEY. I say, if you should reduce the nondefense expenditures by 2 billion, you would not need the 3½ billion that you are now calling upon to nearly the extent that you now need it?

Secretary MORGENTHAU. That is correct, but we still ought to have it.

Senator BAILEY. I am not challenging that, but that situation would be relieved.

Secretary MORGENTHAU. Would be relieved to that extent.

Senator BAILEY. Is not that the sound and reasonable way out of this situation?

Secretary MORGENTHAU. I think that all of us—if I may include myself with you gentlemen as one, I mean in the terrific responsibility we are carrying—well, I will talk just for myself; I do not think that I would be fulfilling my duty if I did not keep repeating, which I do every time I get a chance to come before Congress, that every dollar for nondefense should be eliminated at this time which can be spared. Now, there are some things we have to have, but there are a great many things which I think we needed to get us out of the depression which we could very well do without at this time.

Senator BAILEY. Now, as the fiscal head of the Government, have you made any estimate as to what we might reasonably reduce the nondefense expenditures to?

Secretary MORGENTHAU. Senator Bailey, we have our own ideas, but it is really up to the Director of the Budget to furnish the committee with that information, because he has all of the facts, he has access to all of the departments. I am just one of many departments. He is the central agency who is charged with that duty.

Senator BAILEY. It is the function of the Secretary of the Treasury to call for reduced expenditures, as well as to demand increased revenues.

Secretary MORGENTHAU. I have done that in my statement here.

Senator BAILEY. To what extent do you suggest a reduction of nondefense expenditures?

Secretary MORGENTHAU. I do not name the figure. As I say, I feel under our set-up that is up to the Director of the Budget. He is available and he has access to all the departments which I do not.

Senator BAILEY. The figure was a billion dollars.

Secretary MORGENTHAU. That is right.

Senator VANDENBERG. Have you seen any recent evidence on the part of Congress of a willingness to save any money at all?

Secretary MORGENTHAU. No, sir.

Senator BAILEY. None in the world.

Secretary MORGENTHAU. No, sir.

Senator BAILEY. On the other hand, we have appropriated more and authorized more.

Senator BYRD. Is not this true, Mr. Secretary, that the only effective way to reduce the nondefense spending is to incorporate it in the Budget and submit it by the President to the Congress?

Secretary MORGENTHAU. That is one way, and the Congress could also take the initiative.

Senator BYRD. Do you think Congress should be expected to override the President and the Administration and the Budget to reduce nondefense spending?

Senator VANDENBERG. They did yesterday.

SENATOR BYRD. I mean, is that a practical matter to do? If the administration and the Director of the Budget do not think that the nondefense spending should be reduced, why should Congress think it?

Secretary MORGENTHAU. Well, Senator, you and I know the facts of life.

Senator BYRD. I am speaking about all this nondefense spending. As a matter of fact, it must come primarily in the Budget, and it is submitted by the President to the Congress.

Secretary MORGENTHAU. That is one way.

Senator BYRD. I mean, isn't that the practical way and the only way under the condition that confronts us here?

Secretary MORGENTHAU. No.

Senator BYRD. What other way should you suggest?

Secretary MORGENTHAU. Well, for me to give examples, I am afraid some of you gentlemen might resent it as being in the nature of criticism. I do not want to be placed in that position.

Senator BARKLEY. Of course, the Congress could do it if it would, but it will not.

Senator BAILEY. I differ with the Senator.

Secretary MORGENTHAU. You can say that, Senator Barkley. I cannot.

Senator BAILEY. The Secretary and the Congress will do it if some effort is made as to leadership and coordination. I think if the President, yourself, and the leaders on both sides in the House and Senate get together on a program of retrenchment, the Congress would sustain it.

Secretary MORGENTHAU. Senator Bailey, I have made the suggestion two or three times but nothing has come of it. I would be delighted, at least, to the extent of the opportunity you have given me to make it myself, but they tell me it is impractical and that is this, that the taxing committees in the Senate and House and Appropriations Committee sit down with the appropriate people in executive government and work out a program, but just as long as the appropriating committee is entirely independent of the taxing committee and we do not sit down with the Budget and with the Treasury, I do not think we will ever get anywhere.

Senator BAILEY. I think that is just the point. We have not undertaken to coordinate a program with the Treasury. We are left at loose ends, and here we go with only one outlet, that is only an

increase in the revenue. I notice the chairman of the Ways and Means Committee said this was not the last tax bill. This is the last one I am going to vote for of this character until we do reduce the nondefense expenditures.

Senator BYRD. Would you be willing, Mr. Secretary, to use your influence with the Director of the Budget to bring a Budget to the Congress that will reduce the nondefense spending in the next fiscal year?

Secretary MORGENTHAU. I am very glad to use whatever little influence I have. He is in no way responsible to me, though, so I do not have very much influence.

Senator BYRD. The President submits the Budget and he could very well submit a Budget with a reduction in nondefense spending.

Secretary MORGENTHAU. I am glad to use whatever influence goes with my position along these lines, because I feel it very deeply.

Senator BARKLEY. Would you consider that you had more influence with the President, or he had more influence with you?

Secretary MORGENTHAU. I would put my money on the President.

Senator VANDENBERG. Do you consider the continuing purchases of foreign gold and silver by the Treasury as a nondefense expenditure?

Secretary MORGENTHAU. As to the gold, if you do not mind, that is in a separate category. As to the silver, if you gentlemen want to strike all the silver legislation off the books, it is quite all right with me.

Senator VANDENBERG. Well that is a partial assistance.

Secretary MORGENTHAU. It is quite all right with me. The gold, however, is in a category by itself. If you want to strike the silver legislation off the books, it is all right with me.

Senator BARKLEY. If you strike off the silver legislation, you strike it off for the silver in the United States as well as outside of the United States?

Secretary MORGENTHAU. That is right.

The CHAIRMAN. Are there any additional questions? Senator Byrd, do you have any questions?

Senator BYRD. Mr. Secretary, I would like to ask this question: Is it not possible and probable that the $22,000,000,000 that you now estimate the total expenditures will be increased to, and inasmuch as you increased your estimates repeatedly, from month to month, is it not possible that the expenditures may reach $25,000,000,000 this fiscal year?

Secretary MORGENTHAU. Perfectly possible.

Senator BYRD. I am entirely in accord with your original plan to pay for the expenditures two-thirds pay-as-you-go and one-third by borrowing. Assuming that the $22,000,000,000 is the minimum, and in my judgment it will be $25,000,000,000 and I think you agree it could be $25,000,000,000——

Secretary MORGENTHAU. I agree with you that the defense program is going to work out to nearer $25,000,000,000 than $22,000,000,000.

Senator BYRD. Now, we will need $2,000,000,000 additional in order to make your plan applicable to the $22,000,000,000. How would you suggest raising $2,000,000,000 additional assuming the committee would want to consider that and go into it?

Secretary MORGENTHAU. In this statement which you gentlemen gave me an opportunity to read to you today, if all six of these suggestions were made into the law they would raise somewhere between

$800,000,000 to a billion dollars additional; between $800,000,000 to a billion dollars revenue in those six suggestions which I read.

Senator BYRD. In other words, it would raise a total of 4.5 billion if the present bill should be amended according to your suggestion?

Secretary MORGENTHAU. On top of 3.2 billion.

Senator BYRD. I say 4 billion.

Secretary MORGENTHAU. Yes.

Senator BYRD. How would you suggest getting the additional billion?

Secretary MORGENTHAU. I want to do a little thinking on that.

Senator BYRD. Would you favor a general sales tax, a manufacturers' sales tax?

Secretary MORGENTHAU. That would be the last thing I would recommend.

Senator BYRD. But you have no plans beyond that which you recommended which raises approximately $800,000,000 in addition to the bill as passed by the House?

Secretary MORGENTHAU. Well, coming before this committee, we take it very seriously. We take a great deal of pains and care to prepare a statement. Now to the best of my ability, I have thought out what the Treasury should say here today.

Senator BYRD. As a matter of fact your proposals today do not carry out your formula?

Secretary MORGENTHAU. No.

Senator BYRD. Even on the most limited expenditures?

Secretary MORGENTHAU. That is right.

Senator BYRD. The formula of two-thirds pay-as-you-go and one-third borrowing.

Secretary MORGENTHAU. That is right.

Senator BYRD. Does this $800,000,000 additional include the $300,000,000 that was lost by the House?

Secretary MORGENTHAU. It is in that.

Senator BYRD. In not agreeing to the tax on husband and wife?

Secretary MORGENTHAU. Yes.

Senator BYRD. That is $500,000,000 of additional new taxes that have not yet been suggested, that your suggestions would bring in?

Secretary MORGENTHAU. That is approximately correct.

Senator BYRD. Would you care to submit to the committee a proposal whereby your formula could be carried out in full?

Secretary MORGENTHAU. I would be very glad to.

Senator BYRD. I would be glad to see it.

Senator BARKLEY. Let me ask you right on that point: Outside of the possible imposition of this general sales tax, concerning which I agree with you, I would favor only as a last resort, what other new sources of income are there from which we could get $500,000,000 or $2,000,000,000 of income, or any substantial part of it?

Secretary MORGENTHAU. There are not any new sources, Senator Barkley; you would just have to increase the present sources.

Senator BARKLEY. That is it. It is a simple matter in one way, provided you do not go so far as to kill the goose that lays the golden egg, to increase the various rates that are now imposed in the bill to raise the required amount. Outside of the general sales tax which you mentioned, there is no substantial new source which you can tap?

Secretary MORGENTHAU. That is correct.

The CHAIRMAN. Any questions, Senator Gerry?

Senator GERRY. No.

Senator BAILEY. Do you know what we are spending on the silver program now?

Secretary MORGENTHAU. Yes. We bought something like 35,000,000 ounces. I will ask Mr. White to go into that subject.

Mr. WHITE (Harry D. White, Director of Monetary Research, Treasury Department). In the first 6 months of this year we bought approximately 35,000,000 ounces of domestic silver. In dollars it would be approximately $25,000,000.

Senator BAILEY. How about the foreign silver?

Mr. WHITE. The foreign silver has been very much less than that. I think something in the neighborhood of $2,000,000 or $3,000,000 a month.

Senator BAILEY. At the rate of $33,000,000 a year?

Mr. WHITE. The rate is not that high. The first 6 months of this year we purchased approximately $12,000,000 of foreign silver.

Senator WALSH. What would we save if we repeal the silver legislation?

Mr. WHITE. The Treasury would not save anything, because the Treasury issues currency equal to the cost value of the silver which it buys, and then there is the silver seigniorage which it could take advantage of if it wished to. As far as the budget is concerned, neither the purchases of silver nor the purchases of gold add to the expenses of the Government.

Senator BYRD. What have been the total purchases of gold?

Mr. WHITE. This year?

Senator BYRD. Since the plan was adopted.

Mr. WHITE. I cannot give you an exact figure. Approximately $15,500,000,000.

Senator BYRD None of that expenditure is affected in the Budget?

Mr. WHITE. No. Gold certificates or gold-certificate credits are issued against the gold which is purchased.

Senator VANDENBERG. If you repealed the legislation and let silver take its normal price instead of a pumped-up price, would not it make a difference in the Treasury's prospective situation?

Mr. WHITE. Indirectly, it may make some difference in the sense that the continued issue of silver certificates at this time by increasing the amount of money in circulation has a tendency to increase the prices slightly. With increasing prices it makes the financial picture so far as the Treasury is concerned, a little more difficult. However, when you talk about the effect of silver on the financial picture, we are dealing in the realm of small magnitudes.

Senator VANDENBERG. Is there an inflationary influence in the gold and silver purchases?

Mr. WHITE. There is in the silver but, as I say, only slightly. You are dealing in magnitudes of $35,000,000 of silver purchases in a 6-months' period as against 45 billions of currency and demand deposits. You can appreciate the fact that the consequences of such relatively small additions to the money supply on the price system would not be very significant.

Senator BARKLEY. As a matter of fact, the use of the phrase "purchase of silver" is a misnomer, is it not? The Treasury does not pay out any money for silver; it saves the silver and issues silver certifi-

cates which are taken back by the person who brings the silver to the mint and the Treasury and the silver certificates are issued and put in circulation?

Mr. WHITE. Yes.

Senator BARKLEY. You do not add to the taxes by the purchase of silver?

Mr. WHITE. No.

Senator BARKLEY. Or gold, either?

Mr. WHITE. No.

Senator BYRD. It is as good as any other money.

Senator BARKLEY. It is paid to the man who brings the silver in.

Senator BYRD. That man can take the money and spend it for anything he likes.

Senator BARKLEY. The Treasury did not pay for it.

Senator BYRD. Somebody paid for it. I have often wondered what would happen if gold, for example, went back to its price of $20 an ounce and the Government then had a loss of eight or nine billion dollars on the gold it paid $35 an ounce for. How would that be financed?

Mr. WHITE. Well, if you revalue the gold——

Senator BYRD (interposing). I do not mean if you revalue the gold. Suppose the artificial level of gold were stopped and gold went to the original level that it was when it started to go up, of $20 an ounce and thereby occasion a loss in the gold we now have by billions of dollars, how would that be financed in the Government operations?

Mr. WHITE. Senator, I do not understand what you mean when you speak of an artificial price for gold. The price of gold in any country is the rate which the particular government establishes as the mint price, provided of course, the government is ready to buy or sell gold at that mint price.

Now then, that is the price of gold in this country, it is $35 an ounce.

Senator BYRD. It was increased arbitrarily from $20 an ounce.

Mr. WHITE. It was increased by legislation to $35 an ounce.

Senator BYRD. I contend that that is an artificial price, and I am assuming that the price went down to the prior level.

Mr. WHITE. Assuming the Congress reduced the price from $35 an ounce to $20 an ounce, that constitutes a revaluation of the gold.

Senator BYRD. Is it your judgment that the gold would be $35 an ounce now in the event our Government did not pay $35 for it?

Mr. WHITE. The price of gold is whatever Congress states that it shall be, provided the Treasury buys and sells gold at the statutory price.

Senator BYRD. There is no question in your mind but that the value of gold was increased to $35 an ounce arbitrarily by the price fixed. Was that not in excess of the world price that existed at the time that price was fixed?

Mr. WHITE. I do not want to appear pedantic, but obviously the price of gold in the United States is what you gentlemen make it. If Congress states it is $35 an ounce, that is what it is. In each country the price of gold is in the terms of the currency of that country. In England it is in pounds, in France it is francs, in Argentina it is pesos. The answer to your question, I take it, is that the price of gold in the United States is what Congress fixes it at.

Now, let us proceed from there? What was the further question?

Senator CONNALLY. Let me ask a question. The gold is worth in any country whatever that country says it is worth in terms of the money of that country, is it not?

Mr. WHITE. That is not wholly true, Senator. It may fix a price for gold, and the price in that country, in the currency of that country, might be out of alinement with the market price because the government cannot or does not wish to buy and sell gold at the statutory price.

Senator CONNALLY. That would not be because it did not have a sound currency. In the United States, for instance, we called it worth $20 an ounce; it was worth $20 an ounce because we said 20 grains of gold was a dollar.

Mr. WHITE. Exactly.

Senator CONNALLY. And it is worth $35 an ounce now because we say that the same amount of gold is now worth $35, which was formerly worth $20.

Mr. WHITE. Exactly.

Senator BYRD. It is only worth $35 on the assumption that we buy all of the gold offered at $35.

Senator CONNALLY. No; it would be worth just the same regardless of that.

Senator BYRD. It would not be worth that over the world unless we were willing to pay $35 an ounce for all the gold that was offered us.

Mr. WHITE. When Congress says that the price of gold is $35 an ounce, and if we do not impose any restrictions on the amount of gold bought and sold, then whatever gold comes in we pay $35 an ounce for.

Senator BYRD. We have bought all the gold that has been offered to us, at $35 an ounce, have we not?

Mr. WHITE. We have.

Senator BYRD. Russia or any other country in the world?

Mr. WHITE. From countries all over the world.

Senator BYRD. What is the cost of production of gold?

Mr. WHITE. It varies very greatly, not only from country to country but from mine to mine. It not only varies from mine to mine but as you well know, it will vary from portions of the same mine.

Senator BYRD. There must be some average figure.

Mr. WHITE. The possibility or likelihood of getting an accurate average figure on the cost of production of gold the world over is extremely small, because gold mines do not issue their cost figures.

Senator BYRD. You are an expert and well-informated about it. What is your opinion about it?

Mr. WHITE. Let me put it this way, Senator, and see whether this answers your question. There are some very rich gold mines that can produce gold at a cost roughly equivalent to $12 an ounce. There are very few such gold mines, however. There are a large number of gold mines that produce gold at costs running from $20 to $30 an ounce. There are some gold mines that produce gold and make a very small profit.

Senator BYRD. What would be the average for these larger mines, 75 percent, say of the production?

Mr. WHITE. I should say somewhere between $20 and $30. It is just a guess and nothing more.

Senator BYRD. We are paying more, considerably more for gold than the cost of production?

Mr. WHITE. For gold from many mines that is true.

Senator BYRD. What percentage of the total gold in the world does this country now own?

Mr. WHITE. I should say roughly about 75 percent.

Senator BYRD. As long as we pay substantially more than the cost of production of gold, then we are paying an artificial price, are we not?

Mr. WHITE. No; I should not say that. Would you say, Senator, that the price of wheat on the market is artificial because there were different costs and some farmers get more than the cost of production?

Senator BYRD. That would be governed by how much the fluctuation would be. As I understand you, some large mines produced it at $12 an ounce.

Mr. WHITE. Yes.

Senator BYRD. If you pay $35 an ounce, that is considerably in excess of the cost of production at practically any mine?

Mr. WHITE. If you wish to say when Congress passes a law fixing the price of gold, that Congress is doing something artificial, that is all right.

Senator BARKLEY. What Congress does is not to fix the price of gold, except indirectly by saying how much gold is going into a dollar.

Mr. WHITE. That is correct.

Senator BYRD. I want to differ with you, Senator Barkley. We are buying all the gold that is offered to us from all over the world, and the Treasury will pay $35 an ounce for that gold.

Senator BARKLEY. How much of this 75 percent of the gold does the United States own?

Mr. WHITE. It owns all of it. It has title to all of it.

Senator BARKLEY. I am distinguishing between the Government of the United States and the Federal Reserve Bank. What is the proportion of that gold that is in the Treasury?

Mr. WHITE. The title to gold rests in the Government.

Senator CONNALLY. The Government issues gold certificates against the gold, it issues certificates to the Federal Reserve bank.

Mr. WHITE. That is right.

Senator BARKLEY. Not to the public. The average man does not get any gold certificates.

Senator BYRD. The gold certificates are passed between the Government and the banks.

Senator LA FOLLETTE. I would like to very respectfully suggest that the Banking and Currency Committee may feel we are impinging on their domain.

Senator DANAHER. We do not get any further there either.

The CHAIRMAN. Senator Gerry, any questions?

Senator GERRY. No.

The CHAIRMAN. Senator Guffey?

Senator GUFFEY. I have no questions.

The CHAIRMAN. Senator Danaher?

Senator DANAHER. Mr. Chairman, I would like to ask the Secretary if there is under consideration some new plan for the taxation of insurance companies?

Secretary MORGENTHAU. Not as far as I know. It has not been brought to my attention.

Senator DANAHER. I understood you in your statement, or at least in answer to some questions, you said the last thing you wished to impose would be a general manufacturers' sales tax, or words to that effect?

Secretary MORGENTHAU. That is right.

Senator DANAHER. Well, would not you consider the imposition of this manufacturers' sales tax, which we call an excise tax in the bill submitted, to be just that?

Secretary MORGENTHAU. To my mind, there is quite a difference.

Senator DANAHER. "There shall be imposed on the following articles sold by the manufacturers: Sporting goods, electrical appliances, office equipment, photographic apparatus, washing machines," those are not excise taxes, are they?

Secretary MORGENTHAU. That list has been very carefully selected from the point of view of articles which would compete with our national defense, or articles which are considered luxuries at this time.

Senator DANAHER. Do you consider typewriters to be luxuries?

Secretary MORGENTHAU. That depends upon who uses them.

Senator DANAHER. The Government uses over half of those produced. Are you going to drive those out of business on that principle?

Secretary MORGENTHAU. We may have to. [Laughter.]

The CHAIRMAN. Senator Radcliffe, have you any questions?

Senator RADCLIFFE. Mr. Secretary, do you believe that the mandatory joint return is essentially sound, or do you approve of it merely because of the fact that there have been certain transfers of the character which you referred to?

Secretary MORGENTHAU. I would say a combination of both.

Senator RADCLIFFE. Will you explain that?

Secretary MORGENTHAU. I just feel this way, that at this time, a husband and wife through being able to make separate returns, have a privilege that enables them to pay less than if they paid on one return by each one of them, and if we are going to go out and ask the man who earns $750 a year to pay a dollar or two of tax, I for one, cannot face that man unless I can say to him, "I have exhausted every other opportunity to make every other group pay their fair contribution."

Senator RADCLIFFE. That is, you think the method is sound even though there were not these transfers to which you referred. Do you think that is a sound way of doing it, even though they were not transferred from husband to wife and therefore, the taxes not reduced?

Secretary MORGENTHAU. I believe, under the present abnormal conditions, it is sound.

The CHAIRMAN. Senator Brown, do you wish to ask the Secretary any questions?

Senator BROWN. Mr. Secretary, this bill is divided into main parts, income taxes producing 2½ billion and miscellaneous income-revenue taxes producing the balance of about a little over a billion. How much are we losing every day or every month by not having the excise taxes in effect now?

Secretary MORGENTHAU. May Mr. Sullivan answer that?

Senator BROWN. Yes.

Mr. SULLIVAN. A little over $2,400,000.

Senator BROWN. Per day?

Mr. SULLIVAN. Per day, sir.

Senator BROWN. It took the Ways and Means Committee roughly 3 months to perfect this bill and present if for passage in the House. I made a suggestion some time ago that I thought it would be wise to attempt to divide the tax bill and give consideration as rapidly and as early as possible to the excise taxes. While there would be considerable discussion, I do not think there will be as much discussion as there will be over the income taxes, with the joint return fight, lowering the base fight, so on and so forth. Would it, from your standpoint, be possible and desirable to attempt to divide this bill into two parts and pass the excise tax section and leave out the income tax for further consideration, having in mind that the income taxes do not and cannot be effective until January 1, while the excise taxes, as I recall it, under this bill would go into effect 10 days after passage?

Mr. SULLIVAN. Our experience, Senator Brown, has been that the members of the committees feel that there is an interrelation between the different parts of the taxes; that is, what they are willing to do in personal income taxes depends in some measure upon what they do in excise taxes. Now we share with you the view that it is important and profitable to have the excise portions of this bill go into effect as soon as possible.

We also feel that it is important to the taxpayer, as Secretary Morgenthau said in his statement, that the individual and the corporate income taxpayer shall have a fair idea of what his taxes are to be as soon as possible.

Senator BROWN. My view is, we are losing pretty close to $90,000,000 a month by not having these excise taxes in effect. We have been in difficulties over the income-tax side of this bill. If we take as long a time as the Ways and Means Committee did—which I hope we will not—if it takes 3 months—we might get these excise-tax difficulties out of the way in a month and we would save $180,000,000; that is, we would gain $180,000,000 if we could do that.

Mr. SULLIVAN. That would be about $2,500,000 a day.

Senator BARKLEY. Inasmuch as the House has sent this bill over as a whole, if we simply struck out all of it except the excise taxes and passed it, the whole bill would have to go to conference between the House and Senate.

Senator CLARK. That would mean striking out all except the excise taxes and then going over it again?

Senator BARKLEY. We could not initiate the excise taxes and raise the income we are talking about.

Senator JOHNSON. I wanted to ask, Mr. Secretary, if the Treasury is entirely satisfied with title V and title VI that have to do with the levying of excise taxes, or will there be additional recommendations from the Treasury with respect to these two titles?

Secretary MORGENTHAU. Senator, I would be glad to answer, but I believe Mr. Sullivan is going to follow me. Will it be agreeable to you to wait?

Senator JOHNSON. Perfectly agreeable.

Secretary MORGENTHAU. I think that is right.

Does not he follow me, Mr. Chairman?

The CHAIRMAN. Yes; if you wish him to.

Secretary MORGENTHAU. That is agreeable.

The CHAIRMAN. That is entirely up to the Treasury.

Secretary MORGENTHAU. Could he take care of that?

The CHAIRMAN. Yes.

Secretary MORGENTHAU. Is that agreeable?

Senator JOHNSON. Perfectly agreeable.

Senator WALSH. Mr. Secretary, I was impressed with your suggestion about simplifying the form on which tax returns can be made by people with incomes under $3,000. Has the Treasury thought of a system to simply ask the taxpayer questions in writing and having him file it and the Treasury compute a tax and send him his tax bill, which is done by local communities very often?

Secretary MORGENTHAU. We have not thought of that, but Mr. Sullivan has the simplest blank I have ever seen.

Senator WALSH. It requires a taxpayer, however, to do the compilation?

Secretary MORGENTHAU. This would not.

Senator WALSH. He would not have to figure what his tax was finally?

Mr. SULLIVAN. No, sir.

Senator WALSH. Very good. That is along the line on which I have been speaking.

Secretary MORGENTHAU. Yes.

Senator WALSH. There is one other thing I would like to ask about. Will you or somebody from the Treasury submit the proposed increases of the estate and gift taxes?

Secretary MORGENTHAU. We will be glad to.

Senator WALSH. And the Treasury's plan for excess-profits taxes?

Secretary MORGENTHAU. Yes, sir; we will be glad to.

Senator GUFFEY. Mr. Secretary, is it your intention, or the intention of your Department, to offer a modified joint tax return on the lines you suggested to the present form?

Secretary MORGENTHAU. This blank which I was talking about is in connection with income of people under $3,000.

Senator GUFFEY. I mean a modified joint tax return for husband and wife.

Secretary MORGENTHAU. We can.

Senator GUFFEY. Are you going to submit one on that?

Secretary MORGENTHAU. We will, at your request, be glad to.

Senator CONNALLY. It will not include the Senator from Pennsylvania, of course.

The CHAIRMAN. Senator Clark, did you have anything?

Senator CLARK. No.

The CHAIRMAN. Are there any other questions for the Secretary to answer? If there are no other questions, we will proceed with Mr. Sullivan.

Senator CONNALLY. I want to ask some questions of somebody.

The CHAIRMAN. Do you wish to ask him some additional questions?

Senator CONNALLY. Yes, Mr. Chairman. Is there a tax on yachts now?

Mr. SULLIVAN. Under this bill there is a tax.

Senator CONNALLY. Has there not been all the time?

Mr. SULLIVAN. No, sir.

Senator CONNALLY. You do tax yachts. How about sporting goods?

Mr. SULLIVAN. Sporting goods are included.

Senator CONNALLY. Shotguns and rifles for sporting purposes?

Mr. SULLIVAN. They are already taxed under the present law.

Senator CONNALLY. We haven't any increase on those?

Mr. SULLIVAN. No, sir.

The CHAIRMAN. Mr. Secretary and Mr. Sullivan, will you please supply the committee, if you are not presently prepared to do so, with the estimated yield from the excise taxes for 1942?

Mr. SULLIVAN. Yes, sir.

The CHAIRMAN. Under existing law?

Mr. SULLIVAN. Yes, sir.

The CHAIRMAN. We will be glad to have that. And you will also, of course, have the estimated yield under this bill.

Mr. SULLIVAN. Yes.

The CHAIRMAN. I was particularly interested in getting the 1942 fiscal estimate under existing law and the yield from the excise taxes.

Mr. SULLIVAN. I think it might be helpful to the committee, Mr. Chairman, if we prepared that chart in a form showing the anticipated yield under the present law, the additional yield under the proposed bill, and then the total in the third column.

Mr. CHAIRMAN. Exactly.

Mr. SULLIVAN. Provided this bill is enacted into the law. We will have that for you as soon as possible, sir.

The CHAIRMAN. Would it be possible to have also a statement from the Treasury of the total number of corporations that would pay excess-profits taxes under the present law and indicating the percentage of the taxpaying corporations paying excess-profits taxes between the two classes, that is, those who take the earned income credit and those who take the invested capital credit?

Mr. SULLIVAN. I can give that to you now if you like it, sir.

The CHAIRMAN. When you come on the witness stand.

Mr. SULLIVAN. I have that; yes, sir.

The CHAIRMAN. You have that already?

Mr. SULLIVAN. Yes.

The CHAIRMAN. Now, Mr. Secretary, I believe there are no other questions.

Senator CONNALLY. I want to ask him a little short question.

The CHAIRMAN. All right.

Senator CONNALLY. Mr. Secretary, what is the present limit on the amount of earned income that you can deduct?

Secretary MORGENTHAU. $14,000.

Senator BARKLEY. May I ask, Mr. Sullivan, if he has prepared or can furnish the committee with a table or a list of a numerical estimate of the couples, husbands and wives, who would be included in the modification of the joint return suggestion that has been made by the Secretary? You said awhile ago that your revised figures would estimate about 170,000 families.

Mr. SULLIVAN. About 215,000 families would file separate and community property returns under existing law.

Senator BARKLEY. How many of them would be included in your earned income brackets as applying to both husband and wife?

Mr. SULLIVAN. I will try and give you our best guess on that as soon as possible, Senator Barkley.

Senator VANDENBERG. May I ask if there is any estimate available as to what this would produce if we were to follow this?

Mr. SULLIVAN. We will have that for you; yes, sir.

Senator BAILEY. Have you a table as to the consolidated return or the prohibition of the separate return of husband and wife, by States, as to how many people would be affected in each State?

Mr. SULLIVAN. Yes.

Senator BAILEY. That is in the House report?

Mr. SULLIVAN. Yes, sir. That is already in.

(See H. Rept. 1040, 77th Cong., 1st sess., p. 16.)

The CHAIRMAN. Mr. Secretary, we thank you for your appearance before the committee. You desire Mr. Sullivan to come on next?

Secretary MORGENTHAU. Thank you, Mr. Chairman, for the courtesy. I am available at any time.

The CHAIRMAN. All right, Mr. Sullivan, you may proceed when you are ready.

STATEMENT OF HON. JOHN L. SULLIVAN, ASSISTANT SECRETARY OF THE TREASURY

The CHAIRMAN. Mr. Sullivan, you have a prepared statement?

Mr. SULLIVAN. I have, sir.

The CHAIRMAN. Do you wish to proceed with that until you finish before questions are asked?

Mr. SULLIVAN. Whichever way is preferable to the committee. I think we might perhaps save a little time if I did finish, because in the statement I might eventually answer questions which might otherwise be asked.

The CHAIRMAN. It probably would be more orderly if you finish your prepared statement first. As you say, it might answer some questions that would arise in the mind of someone.

Mr. SULLIVAN. Mr. Chairman, and members of the committee: In his discussion of taxation as an essential part of national defense, Secretary Morgenthau emphasized the need for paying a large proportion of the defense costs from present taxes and the need for making full use of the potentialities of the tax system in resisting price inflation. In the final analysis, the job of defense is largely a production job. The tax system therefore, must be designed to enhance and not burden defense output. The job of defense is also one of national unity. This makes it imperative that as far as possible the huge tax burden necessitated by the emergency be apportioned among the various groups of our population equitably and without discrimination.

The Secretary has laid before you the broad outlines of our tax problem. My statement will deal more directly with the provisions of the pending bill.

In the Secretary's statement before the Ways and Means Committee he indicated a need for legislation to produce annually $3,500,000,000 additional revenue. This recommendation was based on the conclusion that current taxes should provide approximately two-thirds of the Federal expenditures during the emergency period. In terms of the fiscal year 1942 revenues and expenditures indicated last April, $3,500,000,000 additional revenue would have met the two-thirds–one-third ratio of taxes to borrowing.

In the past 3 months the fiscal situation has undergone further change. Expenditures for the fiscal year 1942 are now estimated at $22,169,000,000 rather than the $19,000,000,000 as of April 24. Receipts from the existing revenue system, without the pending bill, are

estimated at $9,402,000,000. Thus, even with $3,500,000,000 additional revenue, the revenue system would still be $1,900,000,000 short of the two-thirds-one-third goal.

This bill, H. R. 5417, is estimated to produce in a year of full operation $3,216,400,000 or $283,600,000 less than the amount recommended by the Secretary. Of this total, $864,800,000 or 26.9 percent of the additional revenues will be derived from increases in individual income taxes, $1,345,200,000 or 41.8 percent from increases in corporation taxes, $151,900,000 or 4.7 percent from increases in estate and gift taxes and $854,500,000 or 26.6 percent from new excise and increases in existing excises.

With respect to the individual income tax, the provisions of the bill are confined principally to increases in the tax rates. The present rate of the normal individual income tax is unchanged, but the surtax rates are increased substantially. Moreover, the surtax under the revised schedule applies to the first dollar of surtax net income, whereas, under existing law the first $4,000 of surtax net income is free from surtax. The bill provides for increases in the surtax rather than in the normal tax, in order to place most of the additional tax burden on the recipients of interest from partially tax-exempt securities.

The rate schedule under the bill differs in certain respects from that proposed to the Ways and Means Committee by the Treasury. The bill imposes a tax of 5 percent upon the first $2,000 of surtax net income and increases existing rates up to those applicable to $750,000. The Treasury recommended that the surtax start at 11 percent on the first $2,000 of surtax net income. Because of the importance of curbing the present inflationary tendency and because of the revenue it would produce, the Treasury repeats its recommendation.

Senator BYRD. Could you give me the estimate of revenue that would be derived from that as compared to the 5 percent?

Mr. SULLIVAN. Yes; under the original Treasury proposal for an individual income tax surtax schedule without mandatory joint returns, it yielded a little bit in excess of 1.5 billion dollars gross yield and 1.3 billions net after allowing for the increased corporation taxes. The surtax schedule that was enacted by the House, including the mandatory joint returns which accounted for about $300,000,000, I think totaled a net increase of about 1.2 billion dollars. Is that correct, Mr. O'Donnell?

Mr. O'DONNELL. The additional net yield after allowing for the effect of increases in corporation taxes, of the individual income taxes at calendar year 1941 estimated levels of business is now estimated at $864,800,000 after the exclusion of the mandatory joint return provision which was contained in the original House bill. That provision was estimated to yield $287,200,000 net as compared with the $258,000,000 net which we estimate will be raised by the present Treasury proposal for a mandatory joint return provision.

Mr. SULLIVAN. $864,800,000 without the mandatory joint return.

Senator BYRD. If that was increased to 11 percent, as you recommended, how much additional would be raised as compared to the 5 percent?

Mr. SULLIVAN. About $450,000,000.

Senator CONNALLY. That is $436,000,000 is it not?

Mr. SULLIVAN. Yes.

Senator WALSH. That leaves out the joint returns?

Mr. SULLIVAN. Yes, sir.

Senator WALSH. $450,000,000?

Mr. SULLIVAN. Yes. The pending bill leaves the amount of the personal exemptions and the credit for dependents unchanged. The Revenue Act of 1940 decreased the exemptions from $1,000 to $800 for a single person and from $2,500 to $2,000 for a married couple. Approximately 8,200,000 new returns are expected to be filed in 1941, and it is estimated that there were approximately 4,000,000 new taxpayers.

Although it leaves the personal exemptions unchanged, this bill will actually broaden the base. It makes the surtax applicable to the first dollar of income after the personal exemption and credit for dependents and since the earned income credit is allowed for normal tax but not for surtax purposes, some income not now subject to tax will be subject to the surtax. Under existing law the earned income credit permits a single person to be free of income tax unless his income is in excess of $888 while a married couple with no dependents is free of income tax unless it receives more than $2,222, although the personal exemptions in these instances are only $800 and $2,000 respectively. The result of the application of the surtax to the first dollar of surtax net income, as provided in the bill, is to make taxable approximately 2,470,000 people who otherwise would be free of tax with the same income. These, together with the persons who will become taxable as a result of increases in their income are expected to raise the number of 1942 income taxpayers 3,405,000 over the 1941 number.

Senator VANDENBERG. And what does that make the total number of taxpayers?

Mr. SULLIVAN. It is estimated, Senator Vandenburg, that if the pending bill is enacted, 17,107,000 individual income-tax returns will be filed during the calendar year 1942, and of this number 10,025,000 will be taxable. To complete the picture at this point, if you care to write these figures down, if the recommendations subsequently to be made in this statement are adopted, that will add to the 17,107,000 people filing income tax returns, another 4,900,000, so that there will be a grand total of 22,000,000 individual income-tax returns filed in 1942.

Senator CONNALLY. Mr. Sullivan, let me ask you, the figures 10,000,000 who file returns and do not pay any tax——

Mr. SULLIVAN (interposing). The 10,000,000 are the ones who are taxable.

Senator CONNALLY. 7,000,000 who will file returns will not pay any tax. Whom do you require to file a return now under this bill?

Mr. SULLIVAN. The requirements are on gross income, rather than net income, you see. A person could have a gross income and the deductions may be such as not to require him to pay any tax.

Senator CONNALLY. You mean, if he has a gross income of over $800 he has got to file a return whether he pays any tax or not?

Mr. SULLIVAN. That is correct.

Senator CONNALLY. That is what I am trying to get at.

Mr. SULLIVAN. Even though there is a cost in our handling of the nontaxable returns, Senator Connally, it is not very great. It only averages about 50 cents per nontaxable return. We think it is well worth while to maintain a continuity of tax record on the individual,

because if the next year he goes over and he has not filed, we look him up and we would get more than the 50 cents.

Senator Connally. You would get more taxes from people who are now not filing any return at all, thinking they are not taxable?

Mr. Sullivan. That is correct, sir. That is our anticipation.

Senator Vandenberg. Will you add one more figure at that point? You are going to have 22,000,000 returns under your proposal?

Mr. Sullivan. Yes.

Senator Vandenberg. How many will be taxable?

Mr. Sullivan. Well, under the pending bill, of the 17,107,000 we would anticipate that 10,925,000 would file taxable returns. Now, I estimate that if exemptions are lowered to $750 and $1,500 an additional 4,900,000 returns would be filed, of which 2,275,000 would be taxable.

Senator Vandenberg. In round numbers, you would have 13,000,000 returns?

Mr. Sullivan. Just about.

Senator La Follette. While you are getting more money from the people in the upper brackets when you reduce the exemption?

Mr. Sullivan. That is quite true.

Senator La Follette. That is where the real revenue actually comes from.

Mr. Sullivan. Of the $303,000,000 we anticipate we will gain as the result of lowering the exemptions, the overwhelming portion comes from the people who today, last year, over the last few years have already been on the tax roll. When you lower the personal exemption for married people $500 as you did last year, one of the results of that is that the married person who is already paying a tax has $500 removed from his exemption and put on his income at the very top bracket.

Senator Vandenberg. There is not any doubt about that. I was just trying to find out how much you were broadening the base in terms of people.

Mr. Sullivan. Yes.

Senator Connally. What would you say about reducing the married exemption to $1,500 but not taxing them as high as you would, say from $2,000 up, say 4 percent, 3 percent, do not you think we would get a good deal of money there?

Mr. Sullivan. I think when we come to the tables you will see that the schedules that are now in the law are not at all too harsh on those people in the lowest brackets.

Senator Connally. I am talking about reducing the exemption from $2,000.

Mr. Sullivan. I am going to recommend that they be reduced to $1,500 for married people and $750 for single people, and that the surtax rates apply on that basis, and we have the tables here to show just what they will have to pay in taxes.

Senator Vandenberg. The total bill passes far beyond the figures you and I have been talking about. For instance, the automobile use tax will reach around 32,000,000 people.

Mr. Sullivan. It will if it is enacted.

Senator Vandenberg. That is what I mean. Certainly it will not, if it is not.

Mr. Sullivan. I beg pardon?

Senator Vandenberg. Certainly it will not if it is not enacted.

Mr. SULLIVAN. That is right. I will reserve my comment on that for a moment.

Senator VANDENBERG. All right.

Mr. SULLIVAN. In the early stages of this bill the Treasury Department took the position that, in view of this substantial broadening of the base, personal exemptions should not be lowered further. However, the threat of rising prices alters the situation. If the cost of living rises substantially, the effect will be to tax small incomes much more than an income tax would at the rates provided in this bill. The reduction of personal exemptions will make it possible for a large number of persons in the country to feel that they are making direct contributions to the defense program. During the course of this tax bill we have had evidence that many people want to make such a direct contribution.

As the Secretary pointed out, persons with small incomes should have an opportunity for filing a short, simple return and finding the amount of the tax on a table instead of being obliged to file the regular return and to make the regular tax computation. The secretary has placed in your hands an illustrative schedule and discussed briefly its application.

I would like to indicate in somewhat more detail how the proposal would operate.

(At this point the following return form was distributed to members of the committee:)

[Front]

Form 1040A 1941

TREASURY DEPARTMENT
INTERNAL REVENUE SERVICE

UNITED STATES
OPTIONAL INDIVIDUAL INCOME AND DEFENSE TAX RETURN

(Auditor's Stamp)

Applicable to salaries, wages, and other incidental income not in excess of $3,000.

(NOTE.—If you are engaged in a profession or business (including farming), or are a member of a partnership, or had income or losses from the sale of property, use Form 1040)

To be filed with the Collector of Internal Revenue for your district on or before March 15, 1941

PRINT NAME AND HOME OR RESIDENTIAL ADDRESS PLAINLY BELOW

(Name) (Use given names of both husband and wife, if this is a joint return)

(Street and number, or rural route)

(Post office) (County) (State)

Do not write in these spaces

Serial No.

Amount Paid, $

(Cashier's Stamp)

Cash—Check—M. O.

QUESTIONS

1. What is your occupation? .....
2. Check whether you are a citizen ☐ or a resident alien ☐
3. Did you file a return for any prior year? ..... If so, what was the latest year? ..... To which Collector's office was it sent? .....
4. Are items of income or deductions of both husband and wife included in this return? .....
5. State name of husband or wife if a separate return was made, personal exemption, if any, claimed thereon, and the Collector's office to which it was sent: .....

Item No.		
1.	Salaries and other compensation for personal services	$
2.	All other income	
3.	Total income	$
4.	Tax to be paid (from Schedule A on reverse side)	$

Explanation of status with respect to personal exemption and credit for dependents

(1) Personal Exemption		(2) Credit for Dependents			
Status	Credit Claimed	Name of Dependent and Relationship	Under 18 years old	Over 18 years old	Credit Claimed
Single, or married and not living with husband or wife	$				$
Married and living with husband or wife					
Head of family (explain below)					
		Reason for support if over 18 years old			

AFFIDAVIT

I/we swear (or affirm) that this return has been examined by me/us, and, to the best of my/our knowledge and belief, is a true, correct, and complete return, made in good faith, for the taxable year stated, pursuant to the Internal Revenue Code and regulations issued under authority thereof; and that I /we had no income from sources other than stated hereon.

Subscribed and sworn to by ....

[1] For each dependent, subtract $400 from your total income and use the balance to determine your tax.

The proposal is intended to apply primarily to persons with incomes from wages, salaries, and interest. A great majority of small incomes is of these types. The incomes of small businessmen, however, are more complicated, involving, as they do, costs of materials, inventories, depreciation, and other expense items.

The simple return form would not be of value to them since computations of these items would be necessary before income could be determined. For other taxpayers with incomes of not more than $3,000, however, the short form would be provided.

Since the short form would be made optional rather than compulsory, the taxpayer would not lose any rights he has under existing law to benefit if he desires from specific deductions such as losses not covered by insurance or capital losses.

In order that the typical taxpayer using the simple table might derive substantially the same tax benefit from deductions that he now derives, the tax appearing on the table should take into account the average amount now deducted by persons with small incomes. Finally, in order to simplify the income-tax table, incomes would be grouped in blocks of $25 with the same tax payable for all incomes within that particular block.

For example, take the case of a single man with a salary of $1,880. If we assume that the personal exemptions recommended by the President of $750 for single persons and $1,500 for married persons and heads of families were adopted, this taxpayer would compute his tax in the following manner:

Now, before I go further with my statement, I would like particularly to call to your attention that this is merely an illustrative schedule and an illustrative form. [Referring to the schedule introduced by Secretary Morgenthau.] It has been drawn up on certain assumptions and it is being presented to you here today, not for recommendation in the form in which you now find it, but to demonstrate the general idea that is involved in this recommendation.

Senator WALSH. It does not need any action by us. The Treasury itself, can adopt this form; can it not?

Mr. SULLIVAN. No. I think we will have to have some provision in the statute, Senator Walsh, to do it.

Here is a man who has an income of $1,880; on the face of the short income-tax form, he would write down his salary of $1,880 on line 1; he would then look at the back of the return and see that his income fell in the block from $1,876 to $1,900, and being single, he would find that his tax would be $94 and this he would enter on the front of the return at line 4. That would comprise all of the computation that man would have to make.

Now, let us assume that it is a married couple with two children and they have a salary income of $2,700 and an interest of $54; they enter the $2,700 on line 1 and the $54 interest on line 2 under the heading "all other income"; they add them together and get $2,754; they turn the form over, they follow it down and they find out where $2,754 is. From this $2,754 of course they have to deduct $800 for the credit for their two dependents. That leaves them $1,954. They look down the table for the $1,954 and they find that they owe a tax of $33 which they write in on the fourth line, and that is the end of their computation.

We believe that this is an extremely simple method which will be very helpful to these people, many of whom have had no financial experience and many of whom have never even seen an income-tax return.

Senator RADCLIFFE. Mr. Sullivan, do you think it is advisable to make a reference, to include husband and wife? As you say, many of the people do not know anything about the returns. The word "dependents" might not be clear to them.

Mr. SULLIVAN. There are some complications in this thing that can easily be ironed out; that I was saving for our discussions when we go into executive session. As a matter of fact, to use just one table, we will have to provide that married spouses, where they both work, will have to report jointly, or if, they choose to report individually they will have to report as single persons, since under these recommendations the personal exemption for a married couple will be exactly twice that of a single person. That works out mathematically correct. We will also have to provide that they cannot pro rate their personal exemption to their credit for dependents. One or the other will have to take that.

Senator BARKLEY. In your illustration here, if a man has got interest in addition to salary, you add $54 interest.

Mr. SULLIVAN. That is right.

Senator BARKLEY. Suppose, instead of receiving interest, he is paying interest; where would he put that?

Mr. SULLIVAN. That is just one of these cases, Senator Barkley, where that man might choose to use the other form. That is one of

the reasons why this form has to be optional. In other words, you note that this relates to the person or the couple who earn no more than $3,000. Now, I doubt very much if the court would sustain legislation forcing people to use this form up to $3,000 which would make a single man pay $195 or a married person $121 and leave in the law the fact that a person who made $3,050 and had to suffer a capital loss, whose house burned down and he suffered a loss of $2,000, he would be paying a lesser tax than the man who only earned $3,000 and for that reason, where there are unusual deductions, we allow them to use the regular 1040 form. They use this at their own election for the purpose of saving the annoyance of computation; and this is drawn up on this basis, that we have tried to allow them, in the computation of this tax, the average amount of deductions which in the past years have been taken by people in those particular brackets. I think it is a good average, but it is not going to answer every case.

Senator BARKLEY. This is commendable in its simplicity, but it seems to me it could be used almost alone by nonproperty owners who draw a salary, because anybody who owns property would be entitled to a deduction for his taxes. There is no place in here for him to deduct his property taxes.

Mr. SULLIVAN. That is right, sir. In computing this we have used as deductions a rough reduction in the tax of about 10 percent, which is about what the average deductions of people in those brackets come to. People who have deductions that are out of line with that, who have capital losses, and other unusual types of deductions, would still use the present form. We think that this would be extremely helpful to the people who do not own property and whose financial and business experience is limited.

The CHAIRMAN. Would it be possible to let me throw this out? I see Mr. Helvering is here. Would not it be feasible and practicable to provide for the repayment of any overpayment of taxes by the low bracket taxpayer without application for refund? Immediate repayment in other words? For instance, would it not be possible to say that any taxpayer whose total ultimate liability did not exceed, X dollars would be reimbursed for any actual overpayment he made without application for refund, or without filing any application, simply paid by the Treasury under its own computation?

Mr. SULLIVAN. I think that happens under the law today.

The CHAIRMAN. Does it happen today?

Mr. SULLIVAN. Yes. Any error that appears on the face of the return is immediately corrected by the receiving office. I have known instances of people coming into the office and saying, "A miracle has happened here. I just got a notice that I overpaid my tax. Is this really true?"

Senator CONNALLY. I got a check back a year or two ago for $4 and something that I overpaid.

Mr. SULLIVAN. I once proposed that there be a tax on refunds.

Senator CONNALLY. What?

Mr. SULLIVAN. I once proposed that there be a tax on refunds on the theory that the recipient would gladly pay.

The CHAIRMAN. But the lower income taxpayer would not have to protect himself against the statute of limitations unless there was an immediate reimbursement?

Mr. SULLIVAN. If we did not find it before the statute of limitations expired I doubt it would be likely that we would ever find it.

The CHAIRMAN. You would never find it?

Mr. SULLIVAN. No.

The CHAIRMAN. The income-tax law is not quite as bad as I thought it was.

Mr. SULLIVAN. Thank you, sir. The estate tax changes in the bill are likewise limited to rate increases. The Treasury's recommendations that the $40,000 insurance exclusion under the estate tax and the $40,000 specific exemption under the estate and gift taxes be reduced to $25,000 each, were not incorporated in this bill. The increases in the estate-tax rates in the bill extend throughout the rate schedule but are substantially lower than those proposed by the Treasury. The present 2 percent rate on the first bracket of the net estate has been increased to 3 percent. The maximum rate of 70 percent effective on the bracket in excess of $50,000,000 has been shifted to become effective on that portion of the net estate exceeding $10,000,000. The gift-tax rates have also been increased so that they continue to be three-fourths of the estate-tax rates. The anticipated revenue increase from these changes amounts to $151,900,000. It has been estimated that if the higher rates and lower exemptions proposed by the Treasury were adopted, the increased yield would be $347,200,000 over present law yields.

The pending bill makes several changes in the corporation taxes. It gives expression to the principle that corporations generally, even those without excessive profits, should bear part of the heavy burden imposed by the defense program. To that end, it provides for an increase in the corporation income tax of 5 percent on the first $25,000 of surtax net income and 6 percent on the balance. This increase—as that of the personal income tax—is imposed in the form of a surtax, in order to reach a substantial part of the interest from more than $20,000,000,000 of partially tax-exempt securities which are held by corporations, principally banks and insurance companies. Corporations having incomes over $25,000 will thus be taxed at an effective rate of almost 30 percent.

When these partially tax-exempt securities were issued it was impossible to foresee the extraordinary demands which would be made upon the American people. Neither the Government nor the corporate purchasers anticipated that the tax benefit from these partially tax-exempt securities would be as great as it is. Each increase in the normal tax rate has increased the tax savings which accrue to the corporate holders of these bonds. To avoid granting a further unexpected bonus, it is necessary that the increase in rates be in the form of a surtax.

Senator BROWN. You are satisfied, Mr. Sullivan, that there are no legal difficulties there?

Mr. SULLIVAN. We are. It has been pointed out, however, that the combined effect of this surtax, together with the postponement of deductions attributable to bonds purchased at a premium until the bonds mature or are sold, may adversely affect the market for many outstanding Treasury securities. We therefore suggest that consideration be given, in the case of public and private bonds purchased at a premium, to requiring the holder to amortize the pre-

mium over the life of the bond in place of the present system of allowing a capital loss at the time of maturity measured by the difference between purchase price and redemption price. Such a proposal would, in effect, treat the interest on such bonds at the effective rate rather than at the coupon rate for tax purposes and would thus be both more realistic and in accordance with commercial practice.

The bill makes permanent the defense taxes which were imposed for a 5-year period by the Revenue Act of 1940. These defense taxes amount, in general, to 10 percent of the taxes to which they are added. In view of their now permanent nature, I suggest that these defense tax rates be integrated with the basic rates, so that the amount of the various taxes can be computed on the basis of a single-rate structure. This will simplify both the text of the revenue laws and the computations to be made by taxpayers thereunder. In the case of the capital stock tax, the House bill increases the tax rate from $1.10 to $1.25 upon each $1,000 of the declared value of capital stock. The anticipated gross increase in revenue from this change is $22,300,000.

The proposed changes in the excess-profits tax are estimated to increase the revenue from this tax by 1,198.3 million dollars. This increase in revenue is accomplished without change in the optional methods of computing the excess-profits credit provided by the Second Revenue Act of 1940. The Secretary has already called to your attention the fact that the Department does not favor a continuation of a method which leaves free of excess-profits tax those corporations with consistently high earnings which represent the greatest ability to pay.

The bill increases the rates of tax, modifies the excess-profits tax base, and imposes a special tax on corporations using the invested capital credit.

The tax brackets of the existing law, graduated according to the amount of the adjusted excess profits net income, are retained. The increase in the tax rate amounts to 10 percentage points in each bracket The proposed rates range from 35 percent on adjusted excess profits net income of not more than $20,000 to 60 percent on amounts over $500,000. The corresponding rates in the existing law are 25 percent and 50 percent.

The most important structural change provided by the bill is the disallowance of the income tax as a deduction in computing the excess-profits tax. This change will increase the amount of income subject to the excess-profits tax and hence the revenue from the excess-profits tax. However, the increase will be partly offset by a decrease in the income subject to the corporation income tax because the excess-profits tax is allowed as a deduction for the purpose of computing the income tax, both normal and surtax.

The excessiveness of profits should be measured by the whole of corporate profits as proposed in the bill and not by the part remaining after income tax as in the present law. Under graduated rates the present procedure results in dropping the taxable excess profits into the lower-bracket rates, thus diminishing the revenue. Further, because the base period income tax is lower than the current income tax—16½ percent as against 24 percent for 1940 and 30 percent for 1941—corporations using the average earnings method are allowed a

greater deduction from profits of the current year than from the profits of the base period average. Such reduction in the excess-profits tax of corporations using the average earnings method seems entirely unwarranted in view of the already liberal excess-profits credits.

In the existing law the invested capital credit is a flat 8 percent on the entire amount of the invested capital. The bill provides that the credit be reduced to 7 percent on invested capital exceeding $5,000,000.

In order not to discourage new equity financing——

Senator CONNALLY (interposing). What would you say about reducing the rate from 8 to 6?

Mr. SULLIVAN. With the reversal of the precedence of deductions in the bill what you are virtually doing is reducing that to 4.9 percent, sir. That is the result of reversing the precedence of the deductions.

In order not to discourage new equity financing, it is desirable to allow a larger tax-free return on new capital than would be obtained under the reversal in method of computing the tax. A special allowance on new capital investment when the excess-profits credit is computed under the invested capital method is made by including new capital at 125 percent of its value. This is the equivalent of allowing an invested capital credit with respect to new capital of 10 percent where the total invested capital is less than $5,000,000 and 8¾ percent where the invested capital is more than $5,000,000.

Senator BYRD. Will you explain that? The allowance does not apply to borrowed money.

Mr. SULLIVAN. That is right.

Senator BYRD. Only to the extent of 50 percent.

Mr. SULLIVAN. That is right.

Senator BYRD. Still I do not think that is right. There is too much difference.

Mr. SULLIVAN. That is even a greater allowance than has ever been allowed under the law before, Senator Byrd.

The allowance is applicable only on new capital which consists of money or property paid in for stock. It does not extend to new capital raised by borrowing nor to earnings and profits retained in the business. Safeguards are provided against the use of the new capital allowance for tax-avoidance purposes.

The excess-profits tax in the present law fails to reach a very large part of defense profits, despite the clear expression of congressional intent that profits growing out of the defense effort should be subject to excess-profits tax. Our examination of the available data shows that many corporations that are the principal beneficiaries of the defense effort and whose profits in 1940 were many times larger than in 1939 and in any of the preceding base period years will pay little or no excess-profits tax. This situation cannot be justified in the light of the growing revenue requirements. In order to reach these profits which are attributable solely to the defense program, the Treasury recommended, and the bill provides, that a flat rate of 10 percent should be applied in such cases to that part of the current profits that exceeds the base period earnings but does not exceed the invested capital credit.

Senator VANDENBERG. Do you consider that an adequate and satisfactory answer to the situation you described?

Mr. SULLIVAN. No, sir; we consider that an improvement to the present bill.

Senator CLARK. What would be the Treasury's recommendation?

Mr. SULLIVAN. The Treasury recommendation was that all companies be obliged to report on an invested-capital basis. Last year you recall we recommended that these companies get a credit of not less than 4 percent of their invested capital but not more than 10 percent of their invested capital. That figure in general would be determined by the average earnings during the base-period years. In view of the reversal of the precedence of the deductions, we want to raise those brackets, because the 4 percent under the reversal of deductions would be very much less and altogether too small. I think we would recommend the same proposal with those brackets changed to 6 or 12 or 15.

The excise portions of the pending bill are estimated to yield $854,500,000. Forty-seven percent of this total derives from raising the rates or broadening the bases of 14 existing excises. Twenty-two new excises are expected to yield 53 percent of the total.

The Treasury recommended but the bill does not contain increases in the existing rates of tax on gasoline, tobacco products, and beer. The Treasury also recommended that the present tax on passenger automobiles be increased to 15 percent; the bill provides for an increase to only 7 percent. At the same time, the Treasury does not approve all the excises incorporated in the present bill. Particularly, it disapproves the proposed $5 use tax on every motor vehicle.

Senator CONNALLY. You mean it is a flat tax? They charge a fellow just as much for riding around in a Ford as a Cadillac?

Mr. SULLIVAN. Yes; and if he uses it only 1 day in the week we charge him just as much as the taxicab that runs 24 hours a day except when it is laid up for repairs.

This tax will conflict directly with one of the most important State and local sources of revenue. In some States the proposed tax will in effect increase the average cost of automobile registration by more than 100 percent.

The proposed tax has no relationship to the extent of use or the value of the object taxed and, therefore, is unusually inequitable. It taxes a $5,000 town car exactly the same $5 as the fifth-hand car worth only $20. This proposed use tax must be collected from 32,000,000 taxpayers located throughout every State and county in the country. This would require an additional personnel in the Bureau of Internal Revenue of at least 3,800 new employees. The administrative cost is estimated to be $9,600,000 or approximately $6 per $100 of tax collected, which is more than five times the average cost of collecting other excise taxes. This automobile use tax is estimated to yield about $160,000,000. Contrast these figures with those pertaining, for example, to the gasoline tax. That tax, yielding $343,000,000 a year, is collected by 15 internal-revenue employees. In this regard it should be noted that to the average motorist who travels 10,000 miles annually the use tax is equivalent in burden to a one-half cent gasoline tax. Or, contrast the proposed automobile use tax with the tobacco taxes. Their annual yield is $698,000,000, which is collected by 88 internal-revenue employees. An increase in either the gasoline tax or the tobacco tax, moreover, would not require any additional personnel.

The measure before you will constitute the largest tax act in history. The Committee on Ways and Means has labored on it assidu-

ously and conscientiously for the past 3½ months. Some have criticized this bill as severe, but our present national peril requires many sacrifices. The severity of this bill is minor when compared to the severity of other sacrifices which are cheerfully made by our citizens. At a time when many men are being called upon to forego gainful occupations to enter our armed forces for a remuneration of $21 per month and at a time when it has become necessary to extend their period of service, those citizens in civilian life will, I am sure, cheerfully make the contributions called for under this bill and will be ready to make ever greater contributions if it becomes necessary.

The CHAIRMAN. Mr. Sullivan, I asked while the Secretary was in the witness chair what the estimated yield for fiscal 1942 of the present excise taxes is.

Mr. SULLIVAN. Mr. O'Donnell will answer that.

The CHAIRMAN. You have here the estimated yield of excise taxes under the pending bill.

Mr. O'DONNELL. Yes, sir.

I will offer for the record at this point a table showing the estimated increased yield over present law of the provisions of H. R. 5417 as it passed the House.

Estimated increase or decrease (—) in revenue yield due to revenue bill of 1941 (H. R. 5417)[1]

Tax	Proposed change	Estimated increase or decrease (—) over present law[2]
Income taxes:		
Corporation:		
Normal tax	Allow excess-profits tax as a deduction in computing normal tax net income; increase withholding rate and increase income-tax rate on nonresident alien individuals and corporations.	—$520,100,000
Surtax	5 percent on surtax net income not in excess of $25,000; 6 percent on surtax net income in excess of $25,000.	644,700,000
Excess-profits tax	Revise basis; increase rates 10 percentage points in each bracket.	1,198,300,000
Total		1,322,900,000
Individual	Increase surtax rates	864,800,000
Total income taxes		2,187,700,000
Miscellaneous internal revenue:		
Capital-stock tax	Increase rate from $1.10 to $1.25	22,300,000
Estate tax	Increase rates	135,900,000
Gift tax	do	16,000,000
Total		174,200,000
Manufacturers' and retailers' excise taxes:		
Distilled spirits	Increase rates $1 per gallon	[3] 122,300,000
Wines	Increase rates	[3] 5,000,000
Passenger automobiles, parts, and accessories	Double rates; revise base	72,200,000
Automobile trucks, busses, and trailers	do	16,100,000
Tires and tubes	Double rates	[3] 44,600,000
Refrigerators, refrigerating apparatus, and air-conditioners	Increase rates from 5½ percent to 10 percent; revise base.	16,600,000
Matches	2 cents per 1,000 except fancy wooden or colored wooden (unchanged).	[3] 8,200,000

[1] As passed by House, Aug. 4, 1941.

[2] Full-year effect. Estimates for corporation and individual income taxes and the gift tax are based on income levels estimated for calendar year 1941; all other estimates are based on income levels estimated for fiscal year 1942.

[3] Excluding nonrecurring floor-stocks taxes collectible only in fiscal year 1942—distilled spirits $38,000,000 wines $1,000,000; tires and tubes, $6,700,000; matches $700,000.

Estimated increase or decrease (—) in revenue yield due to revenue bill of 1941 (H. R. 6417)—Continued

Tax	Proposed change	Estimated increase or decrease (—) over present law
Miscellaneous internal revenue—Continued.		
Manufacturers' and retailers' excise taxes—Continued.		
Playing cards	Increase rate from 11 cents to 13 cents	$1,000,000
Radio receiving sets and parts.	Increase rate from 5½ percent to 10 percent; revise base.	9,400,000
Phonographs and phonograph records.	10 percent of manufacturers' sales price	4,500,000
Musical instruments	do	3,600,000
Sporting goods	do	8,500,000
Luggage	do	4,500,000
Electrical appliances	do	12,600,000
Photographic apparatus	do	10,000,000
Electric signs	do	2,700,000
Business and store machines.	do	13,000,000
Rubber articles	do	21,300,000
Washing machines (commercial).	do	400,000
Optical equipment	do	300,000
Soft drinks	Various rates on bottled soft drinks, finished or fountain sirups and carbonic acid gas.	22,600,000
Jewelry, etc	10 percent of retailers' sales price	56,200,000
Furs	do	20,700,000
Toilet preparations	do	19,700,000
Total manufacturers' and retailers' excise taxes.		496,000,000
Miscellaneous taxes:		
Admissions	Reduce exemption to 9 cents and eliminate certain present law exemptions. Exempt service men in uniform when admitted free, or at reduced rates on reduced admission charge.	60,000,000
Cabarets, roof gardens, etc	5 percent of total bill	2,000,000
Club dues	Reduce exemption to $10 and tax certain privilege fees	2,800,000
Safe-deposit boxes	Increase rate from 11 percent to 20 percent	1,700,000
Telephone, telegraph, radio, and cable facilities, leased wires, etc.	On dispatches, messages, or conversations for which the charge is more than 24 cents, 5 cents for each 50 cents or fraction thereof; revise definition of leased wires.	26,600,000
Telephone bill	5 percent of total bill excluding messages subject to tax above.	43,600,000
Transportation of persons	5 percent of amount paid; 35-cent exemption	36,500,000
Use of motor vehicles and boats.	$5 per motor vehicle; boats at graduated rates determined by size.	160,200,000
Bowling alleys, and billiard and pool tables.	$15 per alley, billiard or pool table per year	2,000,000
Coin-operated amusement and gaming devices.	$25 per device per year	8,900,000
Radio broadcasting	Various rates based on amount of net time sales; stations with net time sales of $100,000 or less per year exempt.	12,600,000
Outdoor advertising	Various rates determined by size of sign	1,700,000
Total miscellaneous taxes		358,500,000
Total excise and miscellaneous taxes.		854,500,000
Total miscellaneous internal revenue.		1,028,700,000
Total		3,216,400,000

Treasury Department, Division of Research and Statistics. Aug. 8, 1941.

Mr. O'DONNELL. With reference to the yield of the present law excise taxes, I will give you those by broad categories, and I will exclude from my oral discussion what are technically called excise taxes, namely, capital stock, estate, and gift taxes, but will include those estimates in the table which I will insert in the record at the conclusion of my remarks.

The CHAIRMAN. Yes.

Mr. O'DONNELL. The liquor taxes are estimated to produce $839,500,000.

The CHAIRMAN. That is the existing tax now?

Mr. O'DONNELL. That is correct, sir. This is not encompassing any changes in the bill.

The CHAIRMAN. Will you give me that again?

Mr. O'DONNELL. $839,500,000.

Tobacco taxes, $723,530,000.

Stamp taxes, including the taxes on issues of securities, bond transfers, and deeds of conveyance, stock transfers, silver bullion sales transfers, and playing card stamp taxes are estimated to yield $44,180,000. The manufacturers' excise taxes—and the table which we will insert in the record will give you the detail of what taxes are included—are estimated to yield $676,000,000.

Miscellaneous taxes, which comprises the taxes on telephone, telegraph, radio and cable facilities, transportation of oil by pipe line, leases of safe deposit boxes, admissions to theaters, concerts, cabarets, club dues, initiation fees, oleomargarine and those special taxes on adulterated butter, coconut and vegetable oils, bituminous coal tax, sugar taxes, and other miscellaneous taxes are expected to yield $208,320,000.

Senator CONNALLY. Those vegetable oils are excise taxes?

Mr. O'DONNELL. Yes, sir.

Senator CONNALLY. On foreign oils or domestic?

Mr. O'DONNELL. I would rather yield to Mr. Tarleau to answer that question.

Senator CONNALLY. You do not have excise taxes on oils?

Mr. TARLEAU. (Thomas Tarleau, Legislative Counsel, Treasury Department). Import excise taxes.

The CHAIRMAN. These are the existing taxes?

Mr. O'DONNELL. Yes, sir; and the estimated total yield of the miscellaneous internal revenue taxes now in the law for fiscal year 1942 is $3,135,630,000 as shown in the table which will be inserted in the record at this point. The fiscal year 1942 collections of the excise taxes will not reflect a full year's operations of the increased excise taxes collected under this bill. For the information of the committee, however, there has been included a second column in the table which shows the amount of a full year's collections of these excises at levels of business estimated for fiscal year 1942. This presentation is therefore hypothetical but it enables us to present in the third column, the total amount of miscellaneous internal revenue which would be collected in a full year of collections with business levels comparable to those estimated to prevail in fiscal year 1942.

Miscellaneous internal revenue—Estimated fiscal year 1942 receipts under present law [1] and estimated full year effect of the revenue bill of 1941 (H. R. 5417) [2] at levels of income estimated for fiscal year 1942

[Thousands of dollars]

	Estimated receipts under present law	Estimated increase or decrease (−) due to revenue bill of 1941 [2]	Estimated total receipts under revenue bill of 1941 [2]
		Hypothetical full year effect [3]	Hypothetical fiscal year [3]
Capital stock tax	193,400	22,300	215,700
Estate tax	350,700	135,900	486,600
Gift tax	100,000	16,000	116,000

Treasury Department, Division of Research and Statistics. Aug. 8, 1941.

Mr. O'DONNELL. Another table has been prepared at the request of the committee and is offered for the record at this point. This table shows the estimated calendar-year liabilities under present law and estimated increased income-tax liabilities under a full-year effect at levels of income estimated for calendar year 1941 of the income-tax provisions of the revenue bill of 1941 as it passed the House of Representatives.

Income taxes—estimated calendar year 1941 liabilities under present law and estimated increased income-tax liabilities under a full-year effect of the income-tax provisions of the revenue bill of 1941 (H. R. 5417)[1] *at levels of income estimated for calendar year 1941*

[In thousands of dollars]

	Estimated liabilities under present law	Estimated increase (+) or decrease (−) due to revenue bill of 1941	Estimated total income tax liabilities under revenue bill of 1941
Income taxes:			
Corporation normal tax	2,939,200	−520,100	2,419,100
Corporation surtax		+644,700	644,700
Individual	2,223,300	+864,800	3,088,100
Back taxes	260,000		260,000
Excess-profits tax	1,026,400	+1,198,300	2,224,700
Declared value excess-profits tax	37,000		37,000
Unjust-enrichment tax	4,000		4,000
Total income taxes	6,489,900	+2,187,700	8,677,600

[1] As passed by the House of Representatives, Aug. 4, 1941.

Source: Treasury Department, Division of Research and Statistics. Aug. 8, 1941.

Senator BARKLEY. Mr. Sullivan in his statement a moment ago as to the amount of tobacco taxes put the figure at $698,000,000. What was the figure of $723,000,000 that was read just a moment ago?

Mr. SULLIVAN. The figure I gave you, sir, was what was actually collected in fiscal 1941 just closed. The $723,530,000 figure is the estimate for fiscal year 1942.

The CHAIRMAN. This is the estimate for the existing excise taxes.

Senator CONNALLY. This motor-vehicle tax, that includes motorcycles, I suppose, does it not?

Mr. SULLIVAN. Yes; and buses.

Senator CONNALLY. Could you tax them at a higher rate than you do an automobile?

Mr. SULLIVAN. I could not, but you could.

Senator CONNALLY. I think they ought to be.

Senator WALSH. Mr. Sullivan.

Mr. SULLIVAN. Yes; Senator Walsh.

Senator WALSH. As I understand your presentation, there are two sharp differences between the House bill and the committee's recommendations, one relating to the form of levying excess-profits taxes and the other relating to the estate tax, estate and gift taxes. Will you state, if you can, how much increased revenue would come to the Government by adopting the Treasury's excess-profits tax plan which is going to be submitted later, and how much more would come by adopting the Treasury's plan for the estate and gift taxes?

Mr. SULLIVAN. If the Treasury plan on the estate and gift taxes were adopted, it would yield $195,300,000 in excess of the present provisions of the bill. If the Treasury's proposal under excess profits were to be adopted with the same reversal in the precedence of deductions as in H. R. 5417, you would get, depending on how much money you wished to get, the same amount of money that can be raised under the present proposals, with this difference, that the average effective tax rate on corporations would be about 6.3 percent less than it is under the present bill.

You see, the effect of adopting the Treasury proposal on excess profits would be to widen the base and whatever particular burden this committee determined should be levied on corporations in the

form of excess profits taxes would be spread over a wider base, and the rate to raise the same amount of money would be about 6.3 percentage points lower than the rates that have to be used to raise that same amount of money under the proposal in the bill as it comes to you.

Senator WALSH. The Treasury is of the opinion that their proposal would reach a larger percentage and more of the manufacturers or producers of defense materials than the House provisions?

Mr. SULLIVAN. Yes; and beyond that and perhaps of more importance, Senator Walsh, is the fact that it would reach a greater amount of the profits of those concerns who are now being lightly tapped by the present excess-profits tax bill.

The CHAIRMAN. You would not actually reach any more of the direct defense profits, because for the most part your defense work is done by highly capitalized corporations which are on the invested capital basis now.

Mr. SULLIVAN. That is true, although there are outstanding examples the other way around. In the main, that is true.

The CHAIRMAN. Yes.

Mr. SULLIVAN. I think you asked me for some figures.

The CHAIRMAN. Yes.

Mr. SULLIVAN. Would you like those now, Mr. Chairman?

The CHAIRMAN. Yes.

Mr. SULLIVAN. On the returns that were received?

The CHAIRMAN. Yes.

Mr. SULLIVAN. I think I should preface this statement by reminding you that the amendments to the excess-profits tax passed very shortly before March 15.

The CHAIRMAN. Yes; and you gave them an additional time.

Mr. SULLIVAN. And because of that the Commissioner felt obliged to give very liberal extensions in the filing date to corporations, and for that reason the picture is not clearly set forth, is not nearly as complete at this time as last year we hoped it would be. The report I now give you deals with the excess-profits tax returns received in the Internal Revenue Bureau through July 17, 1941. There were a total of taxable returns of 10,468. Of this number, 3,583 used the invested-capital method and 6,885 used the average-earnings method. Roughly speaking, those who used the average-earnings method outnumbered those who used the invested-capital method about 2 to 1.

Senator CONNALLY. Were those mostly small corporations that used the invested-capital method?

Mr. SULLIVAN. We can give you the break-down by size, too, Senator Connally. Now those 6,800 who used the average-earnings method reported excess-profits taxes of $135,000,000, whereas the 3,500 using the invested-capital method reported excess-profits taxes of $35,000,000. In other words, that ratio is almost 4 to 1.

Senator CLARK. Mr. Sullivan, what would be the result in the way of additional revenue if you retained the rates of the pending bill and then went to the Treasury's method of invested capital?

Mr. SULLIVAN. I think you might want to lower the rates, Senator.

Senator CLARK. I say, what would be the effect in the revenue if you did retain the rates of the pending bill and then went to the Treasury's method of invested capital?

Mr. SULLIVAN. The increase in revenue would be substantial.

Senator CONNALLY. You would lose a lot of money?

Mr. SULLIVAN. No; we would make a lot of money.
Senator CLARK. It would be a tremendous increase?
Mr. SULLIVAN. That is correct, sir.
Senator CLARK. Will you make an estimate of that?
Mr. SULLIVAN. We can and will insert it in the record.
(The figures referred to are as follows:)

Estimated increase over yield of the present law of the Treasury excess-profits plan using H. R. 5417 tax brackets and rates compared with estimated increase due to H. R. 5417, at levels of income estimated for calendar year 1941

[In millions of dollars]

Tax	Increase (+), decrease (−) over yield of present law		Increase (+), decrease (−) Treasury plan yield over yield of H. R. 5417
	Treasury plan	H. R. 5417	
Corporation:			
Income	−684.1	−520.1	−164.0
Surtax	+603.8	+644.7	−40.9
Excess profits	+1,880.7	+1,198.3	+682.4
Total	+1,800.4	+1,322.9	+477.5
Individual, net increase	+784.9	+864.8	−79.9
Total increase, income taxes	+2,585.3	+2,187.7	+397.6

Treasury Department, Aug. 9, 1941, Division of Research and Statistics.

Senator CONNALLY. You would make a lot even on the reduction of the 8-percent rate?
Mr. SULLIVAN. Yes.
Senator CONNALLY. I thought you wanted to reduce that.
Mr. SULLIVAN. We do, but you see under the present law some companies that are making 30, 40, and 50 percent are not subject to tax if they made that amount during the base period. I have a further résumé of these returns if you would like to have them, Mr. Chairman.
The CHAIRMAN. Yes; I would be very glad to get them.
Mr. SULLIVAN. This through June 30. The total number filed and that were taxable, 11,845; nontaxable, 79,000. The estimated totals that we will expect when the year is over to have received, 88,000 nontaxable excess-profits-tax returns and 13,400 taxable returns.
The CHAIRMAN. What do you estimate it will yield? The total yield of excess-profits taxes?
Mr. SULLIVAN. I am afraid that no figure I could give you, Senator, would be helpful, because there are now outstanding, or there were as of today, August 8, 4,200 extensions. Now many of those are very large concerns.
The CHAIRMAN. You haven't any way of estimating that?
Mr. SULLIVAN. We can. I mean we can go to the financial journals and get financial evidence of their invested capital and their earnings, but it is not going to be at all an accurate picture, and I am afraid it would not be helpful to you.
The CHAIRMAN. Under the House bill, of course, you would increase the total number of excess-profits-tax returns?
Mr. SULLIVAN. Very appreciably.
The CHAIRMAN. You estimate the House bill will now produce from excess profits in fiscal 1942 how much?

Mr. SULLIVAN. $1,198,000,000 increase over existing law. That is on calendar year 1942 liability.

The CHAIRMAN. You mean calendar 1941?

Mr. SULLIVAN. On the liability at calendar year 1941 estimated levels of income; that is correct.

The CHAIRMAN. Yes.

Mr. SULLIVAN. Only about 45 percent of which we will probably collect in fiscal 1942.

Senator BYRD. You said you had some figures about the smaller corporations, as to whether they used the invested capital or average earnings methods.

Mr. SULLIVAN. Yes.

The CHAIRMAN. If the estimated yield on the calendar year 1941 under existing rates holds good, how much would it be?

Mr. SULLIVAN. $1,026,000,000, sir.

The CHAIRMAN. That would make a total from excess profits then of how much?

Mr. SULLIVAN. $2,224,000,000.

The CHAIRMAN. From excess profits?

Mr. SULLIVAN. That is correct, coming from the provisions of the present law and the proposed changes in the pending bill.

The CHAIRMAN. And assuming the estimate under the present rates holds good for the whole year?

Mr. SULLIVAN. We always assume that, sir.

Senator CONNALLY. Are you finished, Senator George?

The CHAIRMAN. No; I want to ask him another question. I notice your particular criticism, Mr. Sullivan, is on the $5 use tax on automobiles.

Mr. SULLIVAN. Yes, sir.

The CHAIRMAN. You very well stated objections, which of course are obvious. I suppose the House had in view this thought, had it not, that this tax would be paid only by those people who were able to own or possess an automobile and that it would carry a certain tax consciousness all the way down as far as those users went?

Mr. SULLIVAN. Oh, yes, sir; and I think that their thinking on that, so far as that objective was concerned, was correct, but now if we are to reduce the personal exemptions to $1,500 for married couples and $750 for single persons——

The CHAIRMAN (interposing). We would get into that same class of owners.

Mr. SULLIVAN. That means, Senator, that a single individual who earns $14.43 a week will pay an income tax.

The CHAIRMAN. He will pay an income tax if the base is decreased.

Mr. SULLIVAN. Yes.

Senator WALSH. If he has an automobile he would pay $5 more.

Senator BYRD. He would pay about $1.

Mr. SULLIVAN. $1, that is right, but we are reaching down far enough to get hold of almost anybody who has an automobile, I think.

Senator BYRD. May I ask Mr. Sullivan some questions? What percentage of the smaller corporations use the average-earnings method for computing the excess-profits tax and what percentage use the invested-capital method?

Mr. SULLIVAN. I do not know how helpful these figures are. You remember I said there were 3,500 corporations that used the invested-capital method. Of that 3,500, 2,800 were under $20,000 of excess-profits income. Of the 6,800 reporting by the average-earnings method, 4,800 were under $20,000 excess profits net income.

Senator BYRD. You did not get my question. What I want to know is what percentage of the smaller corporations use the average-earnings method for computing the excess profits and what percentage use the invested-capital method.

Mr. SULLIVAN. I will figure the percentage for you.

Senator CONNALLY. Are you through, Senator?

Mr. SULLIVAN. Just a minute. There is a misunderstanding as to the Senator's question. When you say the smaller corporations, you mean the corporations with small assets? The figures I gave you were on the basis of small excess profits net incomes. Now, do you want that on small corporate assets?

Senator BYRD. Yes.

Mr. SULLIVAN. Small companies?

Senator BYRD. Reasonably small companies.

Mr. SULLIVAN. Would it be satisfactory if we gave that to you later?

Senator BYRD. Yes.

Mr. SULLIVAN. Have we got it, Mr. Blough?

Mr. BLOUGH (Roy Blough, Director of Tax Research, Treasury Department). These figures are for concerns classified by income after normal taxes?

Senator BYRD. What I want to know is whether the small corporations are using the invested capital method or average-earnings method.

Mr. BLOUGH. I think these figures will show that.

Senator BYRD. I want to ascertain the facts about it.

Mr. SULLIVAN. We will be very happy to give you the facts about it, Senator Byrd, they are as follows:

Of corporations with total assets of under $250,000, filing taxable excess-profits tax returns and received in the Bureau through July 17, 1941, 34 percent used the invested-capital method and 66 percent the income (average earnings) method. Of those using the income method, 54 percent used the general-average method and 46 percent the increased-earnings method.

Senator CONNALLY. Mr. Sullivan, may I ask you a question, not on this point? Is there a clause in this bill exempting from tariff duties all articles imported for national-defense purposes?

Mr. SULLIVAN. No, sir.

Senator CONNALLY. Not any?

Mr. SULLIVAN. No, sir.

Senator CONNALLY. There is somewhere a bill that does.

Mr. SULLIVAN. I am sorry, but I was not aware of it.

Senator BARKLEY. Let me ask you this, Mr. Sullivan. It has no relationship to any particular rate or schedule. Let us suppose that instead of trying to raise $3,200,000,000, that we try to raise $4,000,000,000, would you be prepared, would the Treasury be prepared to make suggestions as to where the other $800,000,000 could be raised over and above the $3,200,000,000, both with the joint return in and with it out?

Mr. SULLIVAN. Yes, sir; we would.

Senator BARKLEY. Would you mind doing that?

Mr. SULLIVAN. No; we would be very happy to.

Senator BARKLEY. I would like to have it myself.

Senator DANAHER. Mr. Chairman, on that point, and to make it perfectly clear, the Treasury has not recommended to this Senate committee any new tax or any change in the taxes appearing in the House bill to replace the $300,000,000 lost by the House elimination of the joint return provision.

Mr. SULLIVAN. Yes; I think the Secretary this morning made six specific recommendations as to that, sir.

Senator DANAHER. That are new to us?

Mr. SULLIVAN. That are new to you, and the additional bill which is now pending before you, Senator Danaher.

Senator DANAHER. And were they contained in his recommendations to the House committee?

Mr. SULLIVAN. Some were and some were not.

Senator DANAHER. I asked him if there was any plan, new plan, to tax the income of insurance companies. I notice from your statement at the bottom of page 8 and the top of page 9 a plan to increase the tax on corporation income 5 percent on the first $25,000 of surtax net income and 6 percent on the balance, the increase being intended to reach partially tax-exempt securities which are held by banks and insurance companies.

Mr. SULLIVAN. That is correct.

Senator DANAHER. So there is a new plan on that particular phase, is there not?

Mr. SULLIVAN. Oh, yes; and there have been conversations in the Joint Committee staff, and among my staff, and between the two staffs on the insurance problem.

Senator DANAHER. Yes. I notice the Secretary said "not that he knew of" in answer to my question. I just wanted the record to show that there was a discussion on that.

Mr. SULLIVAN. Those were general discussions. I think the Secretary said he was not prepared to make definite recommendations.

Senator DANAHER. Yes.

Mr. SULLIVAN. As a matter of fact, some of the work done by my staff and I think by Mr. Stam's staff—correct me if I am wrong—has been done at the request of members of your committee.

Senator DANAHER. Yes. Thank you.

The CHAIRMAN. Are there any other questions that anyone desires to ask Mr. Sullivan?

Senator BROWN. Mr. Sullivan, would the tax that this bill imposes on motor vehicles, the $5 tax, the tax on bowling alleys, billiard tables, and so forth, be very much like the general property tax imposition in the State of Michigan and in a great many other States in the Middle West? While I presume they would be called excise or occupational taxes, it seems to me they are pretty much in the line of property taxes. I think they are legally and constitutionally sound, but I would like to see a memorandum from the legal department of the Treasury as to the constitutional basis for that kind of a tax.

Mr. SULLIVAN. Just those three, sir?

Senator BROWN. Well, any of a similar nature.

Mr. SULLIVAN. We will get it for you.

Senator CONNALLY. Does this bill tax slot machines, and things of that kind?

Mr. SULLIVAN. Yes. The bill taxes coin-operated machines, if they are not vending machines.

Senator CONNALLY. I am talking about the ordinary slot machine, where you can drop a quarter in and get 3 pennies back.

Mr. SULLIVAN. Everything is taxed except the 3 cents that you get and I know you will report that on your income tax.

Senator CONNALLY. I do not fool with them. I see a lot of people just chuck their money into the slot machines. What do you tax? The sales price of the machine? There are so many already out I think you ought to get those that are already out.

Mr. SULLIVAN. Each one of those machines, sir, is taxed $25 each year under this bill.

The CHAIRMAN. A use tax?

Mr. SULLIVAN. That is correct, sir.

Senator DANAHER. If they should pay out, let us say, a box of aspirin, would you tax them?

Mr. SULLIVAN. No.

Senator DANAHER. There would be no tax?

Mr. SULLIVAN. No tax.

Senator DANAHER. You need aspirin after you use some of those slot machines.

Senator GERRY. Has the Treasury suggested any other excise taxes than those that are in the bill?

Mr. SULLIVAN. Oh, yes; we suggested an additional tax of a cent and a half on cigarettes, which are now taxed 6½ cents a package. We suggested an additional tax of half a cent a gallon on gasoline. We recommended an additional tax of $1 a barrel on beer.

Senator GERRY. Is that all?

Mr. SULLIVAN. Those three.

Senator GERRY. Those are the only ones you suggested?

Mr. SULLIVAN. We also suggested a bank-check tax, and a tax on candy and chewing gum. I think that is about all.

Senator GERRY. How does that compare with the excise taxes in the last war, in the 1917–18 act?

Mr. SULLIVAN. In the 1917–18 act there were more retail taxes than there are in here, and many of them, such as the tax on sporting goods, have been very much improved in the present draft.

The CHAIRMAN. Are there any other questions of Mr. Sullivan?

Senator CONNALLY. Let me ask you a question. Does this musical instrument tax reach sheet music, or anything like that?

Mr. SULLIVAN. No.

Senator CONNALLY. It includes phonograph records, though?

Mr. SULLIVAN. Yes, sir.

Senator CONNALLY. I think it ought to include sheet music.

Senator GUFFEY. Does the advertising tax apply just to billboards?

Mr. SULLIVAN. That is all, sir. That was not a Treasury recommendation.

Senator CONNALLY. It applies to radios, does it not?

Mr. SULLIVAN. I beg your pardon. There are two distinct taxes. I think the tax Senator Guffey was referring to was the tax on outdoor advertising, and I think you have in mind the tax on radio-broadcasting stations and networks.

Senator BYRD. Did the Treasury recommend that?

Mr. SULLIVAN. No; they did not.

Senator CLARK. Somebody stated here the other day in an executive session of the committee that the tax, as it came out of the House, only raised $1,700,000. What would it cost to collect that tax?

Mr. SULLIVAN. I hope we never have to find out, Senator Clark.

Senator CLARK. What I am getting at, I have always been opposed to taxes where the cost of collection was so great and the returned revenue was so small that it was practically no revenue for the Government and at the same time was a tremendous burden and nuisance on the people engaged in industry.

Mr. SULLIVAN. You see the bill as now drafted applies only to concerns that advertise for somebody else. The self-advertiser is not taxed, and I do not think we have to be very far-sighted to anticipate if this passed, at least in this form, that the companies that are manufacturing and selling articles will buy the boards.

Senator CLARK. And do their own advertising.

Mr. SULLIVAN. And do their own advertising, and they will be free from the tax as it is drafted in its present form.

Senator CONNALLY. Don't you think it would be a mistake for Congressmen and Senators to vote a tax on self-advertising?

Mr. SULLIVAN. I think that is the best opportunity I have had to say nothing since I got here this morning.

Senator CONNALLY. Why not tax them?

Mr. SULLIVAN. That is something I do not care to express an opinion on.

Senator GUFFEY. Do you have an increased tax on cigars in your recommendation?

Mr. SULLIVAN. We did originally, and then we changed that merely to a reclassification of the types of cigars.

The CHAIRMAN. Is there any other member of the Treasury that you wish to call?

Mr. SULLIVAN. No, sir. The entire staff is at the disposal of the committee for any information that you want to get and that we are able to give you.

The CHAIRMAN. If there is any additional information that is desired of the Treasury by way of estimates, it would be a very good thing for the members of the committee to make that request of the Treasury as early as possible, so you may not be delayed in getting it in. I make that suggestion to the committee.

Senator DANAHER. Mr. Chairman, it may be that Mr. Sullivan can answer this question now. At the top of page 9 of your prepared statement, you talk about the increase in the form of surtax to reach a substantial part of the interest from more than $20,000,000,000 of partially tax-exempt securities which are held by corporations, principally banks and insurance companies. What yield do you expect to get from that item?

Mr. SULLIVAN. $31,600,000 from individuals and corporations.

Senator DANAHER. Thank you.

Senator WALSH. I move we adjourn, Mr. Chairman.

The CHAIRMAN. If there are no other questions of Mr. Sullivan or any other member of the Treasury staff, we will adjourn until Monday morning at 10 o'clock.

(Whereupon, at the hour of 12:45 p. m., the committee adjourned until 10 a. m., Monday, August 11, 1941.)

REVENUE ACT OF 1941

AUGUST 11, 1941

UNITED STATES SENATE,
COMMITTEE ON FINANCE,
Washington, D. C.

The committee met at 10 a. m., pursuant to adjournment, in room 312, Senate Office Building, Senator Walter F. George (chairman) presiding.

The CHAIRMAN. The committee will come to order, please.

In arranging for the appearances of the taxpayers or representatives of the taxpayers who wish to be heard on this tax bill, the committee will appreciate it if you will avoid duplication as much as possible, and likewise condense your remarks as much as possible. You realize that you have got a somewhat bigger problem than you had in the way of paying taxes through any one particular theory. You want to exercise the right, of course, to be heard, and the committee wants to hear you. We have two very simple suggestions that we would like to have adhered to. Where there are a half dozen witnesses on one particular point, if you will consolidate your remarks and have them presented by one witness, unless there are peculiar circumstances that compel the presentation of more than one phase of the matter, you will greatly expedite the hearing and greatly assist the committee in trying to prepare the bill for a report to the Senate.

Now, in arranging the witnesses, day by day, if there should be failure on the part of any witnesses to appear and there should be an opportunity here of anyone else who is here on any other question before recessing or adjourning for the day, the committee will supplement the witnesses on the list so as not to lose any time.

The first witness this morning is Mr. Dockweiler of Los Angeles, Calif.

Mr. Dockweiler.

STATEMENT OF ISIDORE B. DOCKWEILER, REPRESENTING REPAIRERS OF AUTO ACCESSORIES AND PARTS, LOS ANGELES, CALIF.

Mr. DOCKWEILER. Mr. Chairman and gentlemen of the committee, we appear on behalf of the repairers of automotive parts and accessories, not manufacturers of parts and accessories, and we respectfully request the committee to amend on line 20, page 49, of the House bill, immediately after the words "parts or accessories (other than tires and inner tubes and other than radios,"—here insert the following words, "and other than repaired, overhauled, or rebuilt parts or accessories, when sold as such)" and then continue, "for any of the articles enumerated in subsections (a) or (b), 5 per centum."

I wish to state to the committee that we arrived too late to effectively present our matters to the House Ways and Means Committee, and that is why we are here presenting our proposed amendment. We find that because of confusion in the administration of the act, the old act, which confusion will probably accompany this act unless the clarification that we request is made, that the difficulties that we have had with the Internal Revenue Department will not only exist but will increase.

Now, I will ask, with the consent of the chairman and the members of this committee to have my associate, Mr. Einzig of Los Angeles, present a few remarks and marshal the witnesses. We will be just as brief and as quick as possible in the presentation of our case.

(Mr. Dockweiler submitted a memorandum as follows:)

Repairers of automotive parts and accessories urge an amendment by insertion of the words "other than repaired, overhauled or rebuilt parts or accessories, when sold as such)" at page 49, lines 19-20-21 of H. R. 5117, immediately after the words, "parts or accessories (other than tires and inner tubes and other than radios" [here] for any of the articles * * *" and so forth.

This section has been misinterpreted by the Internal Revenue Department in administration and therefore needs clarification. The excise tax in the present act (3403, subsec. (C) of U. S. Code) was intended and so reads that it shall be upon manufacturers, not repairers.

Originally, the custom was that if a generator, distributor or any accessory of an auto became damaged, the garageman took this part out and repaired this unit, in his own shop, and replaced the same unit, absorbing several hours in this operation, thereby preventing the use of the auto for such length of time, while the repairs were being made.

However, because of time lost, and inexperience of garage mechanics, the present custom now is to take out the damaged unit, in the garage, and immediately substitute a second-hand accessory, previously repaired and overhauled. Garages send this damaged unit to the specialty repairer, who exchanges the damaged unit for repaired unit, thus saving time and enabling auto owners to resume their journey without delay.

Cost of repairing is the only charge made by the repairer in the above illustration, but if the repairer does not receive the damaged unit immediately, he imposes a deposit charge until this damaged accessory is delivered to the repairer and then the deposit charge is canceled against the garageman.

Internal Revenue Department concedes that garagemen are not subject to excise taxes but insists that repairers must pay excise taxes as it contends the repairer is a manufacturer because he repairs more than one accessory at a time, although the operations are identical.

For example, the repairing charge for a distributor is $1.10 and if the damaged unit is not received at the time of the transaction, a $5 deposit is charged, yet the Internal Revenue Department assesses a tax on the $6.10, although the repairer receives only $1.10 because the $5 deposit is credited back to the garageman when the damaged unit is delivered to the repairer.

Repairers do no casting, or manufacturing, but repair only used units.

Strange as it may seem, no uniformity exists throughout the United States in making tax assessments. In many Internal Revenue districts the repairer has been informed no charge can be made, and yet in only a few districts the Internal Revenue collectors are insistent upon payment of the excise tax upon the alleged ground that the repairers are manufacturers, although used units were once taxed when new.

Therefore such repairers are respectfully urging the addition of the following 14 words, printed in italic, to the present bill, at page 49, line 19, H. R. 5117, to read as follows:

"Parts or accessories (other than tires and inner tubes and other than radios *and other than repaired, overhauled, or rebuilt parts or accessories when sold as such*) for any of the articles enumerated * * *" and so forth.

STATEMENT OF BEN WHITE EINZIG, REPRESENTING REPAIRERS OF AUTO ACCESSORIES AND PARTS, HOLLYWOOD, CALIF.

The CHAIRMAN. Will you state your name for the record?

Mr. EINZIG. Ben White Einzig.

The CHAIRMAN. Of Hollywood, Calif.?

Mr. EINZIG. Yes.

The CHAIRMAN. Representing whom?

Mr. EINZIG. The repairers of auto accessories and parts of Los Angeles.

The CHAIRMAN. Is it clear that the House bill intended to impose the tax that you are now complaining of, or is it a question of interpretation?

Mr. EINZIG. It is a question, I believe, of clarification.

The CHAIRMAN. Is there anyone here representing the Treasury or the staff?

Mr. RAY (George E. Ray of Office of the Legislative Counsel of the Treasury). Yes, sir.

The CHAIRMAN. Was it intended to cover in this bill the repairs about which these gentlemen are complaining?

Mr. RAY. No; the intention of the bill was not to cover repairs, but in certain cases transactions which might be construed as repairs or sales are confusing, and in such cases the Bureau of Internal Revenue has prescribed rules to determine what constitute merely repairs and what constitutes accessories.

The CHAIRMAN. All right. You may proceed.

Mr. EINZIG. Mr. Chairman, the act specifically provides that there shall be a tax in the old bill of 2½ percent upon manufactured parts and accessories. We contend that these repairers do no manufacturing whatsoever. There is an exchange that takes place, and upon that exchange a repair is made. These individuals do no manufacturing or casting of any kind, they merely exchange the old unit, repair the old unit, and then again give it back to the garageman.

We have been told heretofore by the Treasury Department that we can have this matter adjusted by the administration, but the fact remains that in the State of California, especially in Los Angeles, the collectors of internal revenue say that the tax shall be paid because these gentlemen are manufacturers. Four hundred miles away in San Francisco the same operators have been told that the operations are repairing, therefore there is no tax. In Denver, Colo., the same thing exists, there is no tax; they have been told that they are not taxable; and in Chicago they have been told that they are not taxable.

The CHAIRMAN. This would get right down to the point, and you will help us by answering this: Do you want us to insert an amendment here that will clarify that? Is that the idea?

Mr. EINZIG. Mr. Dockweiler has presented that amendment. There seems to be some difficulty with the Treasury Department as to whether we are manufacturers or not; we have therefore brought three gentlemen who are repairers, who have the parts, the old parts, and I believe can demonstrate within the period of 3 or 4 minutes what we do.

Senator TAFT. Do you mean you do not want a tax on remade parts or accessories? Is this business a sort of remade parts and accessories, or are they just repairs?

Mr. EINZIG. It is strictly repairs. We have to have an old unit as an exchange. You see, the old unit we exchange, we repair the unit and hold it for the next one.

Senator TAFT. Your amendment is "rebuilt parts or accessories". That implies the sale of second-hand parts that have been repaired.

Mr. EINZIG. It is an exchange plus a repair charge.

Senator TAFT. It may not be. Under this amendment it may be no exchange at all.

Mr. EINZIG. When sold as such; when sold not as a used unit.

Senator TAFT. You are talking about exchanges and repairs. It is the suggestion that the repaired work, according to this amendment, would be excepted?

Mr. EINZIG. Yes; that is correct.

Senator TAFT. Does not that apply to all second-hand parts, practically, where any work is done?

Mr. EINZIG. That is correct. In this situation, however, the price of the repair is usually $1 or $2, plus the fact that on the exchange they place a deposit until we get the old unit back, until we make the repair, and we keep the money for the repair and we must refund the deposit.

Senator TAFT. I do not see what that has got to do with this amendment; if you feel to do that you have got to treat it in some other way. This covers the second-hand repairs, no matter whether it is an exchange or not.

Mr. EINZIG. There seems to be tremendous confusion in the Treasury Department whether we should or should not pay on those items. The only purpose of this particular amendment is to clarify that particular point. If there are no other questions, I should like to have Mr. Van Alen, a repairer of Los Angeles, to bring forth a generator.

The CHAIRMAN. Suppose you bring him around as a witness? You do not need to make any exhibit, because I think we can understand what you are getting at.

STATEMENT OF RALPH A. VAN ALEN, REPRESENTING THE REPAIRERS OF AUTO ACCESSORIES AND PARTS, LOS ANGELES, CALIF.

The CHAIRMAN. Will you please give your name?

Mr. VAN ALEN. Ralph A. Van Alen, Los Angeles, Calif.

The CHAIRMAN. How do you describe your business, Mr. Van Alen?

Mr. VAN ALEN. Mr. Chairman and members of the committee: We are in the business of repairing used automobile parts and accessories, to provide a faster and better service for the car owner, the truck owner, or the tractor owner.

The CHAIRMAN. Do you sell any new parts?

Mr. VAN ALEN. We do not sell new parts, we do not make any new parts, and we must have the old part repaired or we could not continue in business. The process of the business is all for the purpose of saving time for the owner of a piece of equipment repaired if the unit is repairable, or for the purpose of saving time for the owner of a car or a truck or tractor. A repaired unit is available so that when the garageman wants one he does not have to tie up the piece of equipment for several hours either while he is doing the work on that car or while he is doing work on some other car. All of the units that we furnish are made from old units, such as will be returned to us.

The process of the business, the flow of trade, is that if we have such a unit on hand, the garageman may call upon us for a generator, or pump, to fit a certain model of car, and we will send it out to him, receiving in return the one that he has removed from that car on which a tax was paid, and then we will repair that unit so that it will be available for the next one.

Senator TAFT. The title passes in each case? You acquire title to the one you get back?

Mr. VAN ALEN. Yes, sir; we do.

Senator TAFT. You sell the other piece to him?

Mr. VAN ALEN. We sell the piece on which a tax has once been paid. If that unit was taxed every time it came into our hands it may imply taxation six or seven times in a couple of years on the same article. We do not make any new articles, we could not make any new articles, we must have the old one to work on, we must have the one which has come from that automobile as a complete unit to work on. The part that we placed in that unit, if parts are required, if it is more than labor and adjustment, those parts are purchased from factories who pay taxes on those parts and who pass the taxes on to us. In many cases the parts we use are offered to the car owner for doing the same work that we do. In fact, in some instances they are put up in packages and labeled "Repair kit," so that the car owner in the remote territory may purchase such a kit and make his own repairs.

In our case what happens is we may get a unit such as this, a Ford distributor, sent in to us, which is very dirty, which needs to be cleaned, which needs to be adjusted, and probably needs a new set of contact points. When we receive it we will take it apart, we will wash it completely and check the parts in it, see what parts, if any, are needed, and if such parts are needed they will be replaced with tax-paid parts.

The Revenue Bureau has consistently and repeatedly told us if we put that unit back on the same automobile there would be no tax on it, because it would be a repair job, but if it went into some other automobile it would be considered manufacture, although, frankly, the work is identical in either case. We do not know where to draw the line.

They have also told us if we wash one of these at a time it is a repair job, but if we wash 2, 5, or 10 at a time it becomes manufacture. For the purpose of improving our service we will wash several at one time, because we can wash 5 or 10 at a time faster than we can wash 5 or 10 individual pieces.

They have told us in some instances the item is not taxable, and in other instances such an item is taxable.

In every case the unit we sell has come from a tax-paid automobile, and the unit we work on is a complete unit. We cannot make any parts in the unit; we must have all of the parts to work on. When it goes back it is exactly the same kind of unit that we received. We have not created anything new or different.

If we have received an armature, as sometimes happens, a man wants an armature, such as this article [indicating], or a shaft with this particular armature gone, where the commutator is all dirty or sooted or carboned up, it is not making a good contact or performing properly, or it may be that the shaft is bent and sprung from service. In such a case we would clean up the commutator and make certain it was round before we put it back, or we might straighten the shaft

by pounding it, and it would have a complete contact bearing surface and performing in good order. It would look like this [indicating]. It is still the same article when we get through, but the Revenue Bureau has said it would be a manufactured armature in a great many instances.

Senator TAFT. Mr. Chairman, may I ask the Treasury what happens if a second-hand automobile is extensively repaired, because the car is broken up in an accident, and then sold as a second-hand automobile?

Is there a tax on that?

Mr. RAY. There is no tax on second-hand automobiles.

Senator TAFT. No matter how much repair is done on them?

Mr. RAY. No.

Senator VANDENBERG. Is this problem localized in California?

Mr. VAN ALEN. No, sir; the problem exists throughout the country.

We have objected to the Revenue Bureau interpretation by taxing us and not taxing someone else. They said, "Maybe the collector in that district is not on the job as well," but they will get around to him. We say, "We do not know which of these units we are expected to pay a tax on and which we are not," and then he says, "You better have Congress clarify the law for you." They have come in to us and told us, at one time or another, that certain articles are not subject to the tax, and then after several years they come back and make another assessment of the tax upon us based upon different values. Sometimes they tax the work we do only, on the repair charge, and in other cases they have done this, they have said, "You have exchanged that to a man for a dollar"—perhaps I can explain better with the distributor. They said, "You have exchanged that to a man for a dollar, you have given him this new article in place of one which is not new, but is second-hand, the exchange man ordered this from you before he took the old one, maybe, from the car." Now, maybe the man wants to keep his car running, so when we send it out to him we bill him $1 for the repair service and $5 for a deposit, so we will get the old unit back. If we did not get the old unit back we would not have another to work on for the next customer. We would be out of business if we were to do that. The Treasury Department has taxed us on the basis of $6 in this instance, although our total income was just the $1. They have told us the tax applied, they have repeatedly held to the ruling that the tax applies to the value of the repair plus the old article taken in.

The CHAIRMAN. If you buy any new parts from the dealer, the wholesaler, or the factory, you have to pay a tax on it?

Mr. VAN ALEN. If we buy new parts from a manufacturer or wholesaler, those parts have been taxed at the point of manufacture, and in most cases the invoice states specifically, at the bottom of the invoice, "excise tax," or "manufacturer's excise tax, 2½ percent."

Senator CONNALLY. What about the old parts that you take out from a knocked-down automobile?

Mr. VAN ALEN. You mean if we use them? You mean if we rebuild and recondition such a part?

Senator CONNALLY. No. A fellow comes along and he wants a new part, you are going to repair his car, you need a part, and instead of giving him a new part you give him a part out of another car.

Mr. VAN ALEN. He does not order a new part from us, because we are not in that business, but in such an instance what would happen——

Senator CONNALLY (interposing). I understand what would happen. The question is: You take the car to the shop to be repaired, it needs a certain part and instead of using a new part you use a used part off of some car that has been junked; then what?

Mr. VAN ALEN. I do not know what you mean by "Then what?" but that circumstance would not occur very frequently.

Senator CONNALLY. I did not ask you that. Supposing it did occur, what would happen? Don't you do that at all? Don't you use any used parts in repairing the automobile?

Mr. VAN ALEN. Sometimes they might; yes, sir.

Senator CONNALLY. That is what I am asking you.

Mr. VAN ALEN. Yes; sometimes they might.

Senator CONNALLY. Do they pay any tax?

Mr. VAN ALEN. Those parts had taxes paid on them when they were put in the automobile.

Senator CONNALLY. Do you pay any tax on them?

Mr. VAN ALEN. Not in that case.

Senator CONNALLY. That is going a long way around to get the question answered.

Mr. VAN ALEN. Not in that case. What has happened is this: This is an exact case. We received a telegram from down in Arizona that they needed a starter for a certain automobile. We did not have such a starter on hand, so we went to looking around here and there for a suitable starter. We went to the wrecking yard and bought a starter. The wrecking yard would have sold it as a second-hand starter and there would be no tax, there would be no assessment made on that second-hand starter. We bought it, we brought it to the plant, washed it up a bit, got to working on it, tested it to make certain that it worked properly, and shipped it out. In a few days we got back the old starter from the car in Arizona, which we then fixed up to go out on the next call for such a unit. Some day the Treasury Department will come along and go over our billing and charge us a tax on the starter even though we never touched it, even though we did not open it up, simply because we handled it in a different manner than the wrecking yard, or because it went into a different car from the one that it came out of.

Senator RADCLIFFE. Mr. Van Alen.

Mr. VAN ALEN. Yes.

Senator RADCLIFFE. Do I understand the part from the damaged car is used in substitution for the repaired part, the idea being that the damaged part will then be put in condition, repaired if necessary, cleaned, and put in a condition to be available for some subsequent transaction?

Mr. VAN ALEN. That is right, sir.

Senator RADCLIFFE. That presupposes, I suppose, that the damaged part can be repaired and fixed up?

Mr. VAN ALEN. Yes.

Mr. RADCLIFFE. I would assume in many cases it could not be done, and in that event there must be a need for second-hand parts that would not come through that transaction.

Mr. VAN ALEN. I do not know of any cases when that damaged part could not be repaired, when it would be sent in to us or accepted and handled by us. If it could not be repaired there would be no benefit in sending it in.

As a matter of fact, in a distributor like this [indicating], where an essential part of the unit such as the housing is broken, and where we cannot make or create any housing, we definitely refuse to accept that distributor from the customer. The only difference between our work and the work of a garageman is that we do it for the garageman instead of he doing it for himself. If he did the same work in his place, there would be no tax assessed upon him.

An instance that I know of was where a gentleman had a Packard automobile and he needed another armature for it. When he went to the service station he had had to wait several hours for that armature. In order to avoid that loss of time again, and I believe with several hours included running overnight, he procured another armature that the garageman told him "will fit that automobile," that he might use as a part, the same as a spare tire. He took that back to his garage and kept it on hand as a spare. It was not a manufacture, it was simply the same as his own that had been repaired. When it was originally installed in the car, a tax had been collected upon it.

Senator RADCLIFFE. When you take a spare part of an automobile and fix it up so it may be available for a subsequent transaction—that is what you mean?

Mr. VAN ALEN. Yes.

Senator RADCLIFFE. Suppose the old part cannot be fixed up, or that the damages to it in many cases would be so serious that it could not be fixed up; in that case where do you find your source of material in order to meet a new transaction?

Mr. VAN ALEN. In instances where we do not have a part on hand we have to buy a new part at a higher price than we would sell the repair service for. When new models come out and there are no used parts available, as for instance the 1941 models of automobiles, we buy a number of new ones so as to start this rotation. We start with a new one on the first call and receive the used one back, which we recondition.

Senator RADCLIFFE. Could not you buy those parts from second-hand dealers who wreck cars?

Mr. VAN ALEN. Sometimes we could, but we could not find the miscellaneous parts for the later model cars.

Senator TAFT. Are not there a lot of people in the business who supply old parts from junk yards and recondition those parts?

Mr. VAN ALEN. I do not believe so for the purpose of selling them outright, because the only place that the good business is, is on this exchange of parts. People do not buy second-hand parts to put on the shelf and maintain them there.

Senator TAFT. You say you do not buy junk parts. Who does buy all the junk parts that come from junk yards?

Mr. VAN ALEN. We sell a lot of junk parts, if we have salvage material, at so much a pound.

Senator TAFT. Are not a lot of the parts in the junk yards salvaged and reconditioned?

Mr. VAN ALEN. Yes, sir. Many of the parts are salvaged.

Senator TAFT. Now, is a person in that business taxed under the present law or not?

Mr. VAN ALEN. In the wrecking yards he is not. This is what occurs: An automobile may be in a fire or may be wrecked and the radiator and front wheels might be burned up, but the generator, or the rear end, might be just as good as it was before. The wrecking yard might get the automobile and throw away the parts that are wrecked and take out the parts that are not wrecked, which are still usable as second-hand parts. There is no tax applied to the sale of second-hand parts, but if we go to the wrecking yard and buy it and then sell it and pass it on, and take an old one in trade for it——

Senator TAFT (interposing). I do not care what the business or the trade does with it, but the important question is the work that is done on the old part.

Mr. VAN ALEN. Yes.

Senator TAFT. And anybody in that business might be called a manufacturer conceivably.

Mr. VAN ALEN. He is called a repairman.

Senator TAFT. Is anybody taxed except your particular kind of business?

Mr. VAN ALEN. I do not think anyone except our class of business is taxed. I know people in our class of business are taxed, and I do not think Congress intended to tax the repair work in the old law.

Senator TAFT. How would you distinguish your business from a man buying a second-hand automobile, reconditioning the automobile which was not taxed?

Mr. VAN ALEN. I could not distinguish it from that, except we also will do repair work for anybody.

The CHAIRMAN. Is there anything else?

Senator RADCLIFFE. A dealer who wrecks an old car and, as you say, discards the parts which are of no value and retains those which have some value, of course, in many cases, those parts have to be put in condition, he has to repair them, and then he sells them as a second-hand dealer, or as other second-hand dealers in parts do; does he pay any tax?

Mr. VAN ALEN. He does not pay any tax, any more than a man who sells second-hand clothing pays tax on manufacturing. There must be people who buy and sell second-hand clothing.

Senator RADCLIFFE. He is disposing of a second-hand part which he may or may not repair?

Mr. VAN ALEN. That is correct, but he does not pay any tax on it.

Senator VANDENBERG. Mr. Chairman, in connection with this witness' testimony, I would like to have printed in the record, if I may, a letter from the Michigan Engine Rebuilders Association of Detroit, which indicates that the need for clarification, at least, in the law is so pressing, because the tax is being collected retroactively, and in many instances in the Detroit area the accumulated back assessments total more than the value of the business.

Mr. VAN ALEN. That is quite true.

Senator VANDENBERG. I would like to have that printed in the record, if I may.

The CHAIRMAN. Very well.

(The letter referred to is as follows:)

MICHIGAN ENGINE REBUILDERS ASSOCIATION,
Detroit, Mich., July 30, 1941.

The Honorable ARTHUR VANDENBERG,
Senate Office Building, Washington, D. C.

DEAR SIR: In confirmation of our telegram of this date, regarding the tax on repaired automobile parts and accessories, we wish to submit these facts regarding a deplorable situation which has arisen and which we believe was never contemplated by Congress.

Subsection C of section 3403 of the United States Codes placed a tax on the sale by the manufacturer, producer, or importer of automobile parts or accessories. The administrative interpretation which has been placed on this section has resulted in every parts jobber, dealer, garage, machine, and repair shop that repairs, overhauls, or rebuilds and sells any used automobile engine, part, or accessory being taxed as a manufacturer, even though he advertises the fact that they are repaired, overhauled, or rebuilt.

This interpretation has resulted in thousands of parts jobbers, dealers, garages, machine, and repair shops becoming taxable as manufacturers, simply because they have repaired and sold some used automobile engine, part, or accessory. The Commissioner of Internal Revenue is now applying this principle retroactively, resulting in enormous assessments being placed against small businesses, which do no manufacturing whatsoever, and resulting in liens being filed and bonds demanded to insure payment. In many instances these assessments far exceed the entire worth of the businesses, which can only result in ultimate confiscation. It is unthinkable that the Congress ever intended such vicious and wholesale destruction of otherwise valuable small taxpayers.

The interpretation, which has been placed on the act as it now stands and which will continue if the act is not clarified, has resulted and will continue to result in assessments of large sums of money, which, in fact, will never be collected, due to the inability of these small businesses to liquidate for the amounts involved.

The act as now interpreted has not only defeated itself by assessing uncollectible taxes, but also threatens ruin for those that have been assessed. The result is the destruction of the small taxpayer who constitutes the backbone of the present defense-tax structure.

The simplest clarification is to immediately amend subsection C of section 3403, United States Codes [by inserting the words printed in italic], to read in part as follows:

"(C) Parts or accessories (other than *repaired, overhauled, or rebuilt parts or accessories when sold as such, and* tires and inner tubes) * * *."

We appeal to your sense of justice and fair play to lift this threat of destruction from the small one-man businesses scattered throughout our land, all operated by loyal and industrious Americans.

Yours very truly,

THOMAS V. LOCICERO,
Executive Secretary.

Mr. VAN ALEN. If I may add, I would like to say in Los Angeles, there are 10 or 11 people in the style of business I am in, and not less than 3 of them have said to me, "If you want to assume the tax bill that is presented to me, I will give you my business, because it is really far more than the business," and one man has said, "Although the Revenue Bureau is willing to take my bill in settlement, it means for the next 4 years I shall be working for nothing."

The CHAIRMAN. I think we get your point. Is there anything else?

Mr. EINZIG. We have one more witness, Mr. Thompson, of New Jersey.

The CHAIRMAN. Covering the same ground, Mr. Thompson?

Mr. THOMPSON. No; now, just to show how the Internal Revenue Bureau has collected the taxes in the past. I am not going into any detail about the articles.

STATEMENT OF ROBERT R. THOMPSON, REPAIRERS OF AUTO ACCESSORIES AND PARTS, OF NEW JERSEY

The CHAIRMAN. Give the reporter your name. We have given you 30 minutes on this matter. It is a very simple matter.

Mr. THOMPSON. It will just take 2 minutes.

The CHAIRMAN. What we want to see is the regulation of the Treasury— that it will be put into the record. I wish you gentlemen would provide the regulation of the Commissioner of Internal Revenue.

Mr. RAY (George E. Ray, principal attorney, Office of the Legislative Counsel, Treasury Department). Yes, sir.

The CHAIRMAN. I want to ask you just this one question: When the tax is imposed upon people who engage in the work that these gentlemen are engaged in, is it on the theory that they are manufacturers?

Mr. RAY. Yes, Senator. Fundamentally, that is the theory.

The CHAIRMAN. I suppose so, on the theory that they are manufacturers. If you put that regulation in the record, I think we can understand the whole case.

(The memorandum from the Treasury Department referred to is as follows:)

Re: Manufacturers' excise tax on the sale of automobile parts and accessories.

The following provisions of Regulations 46 (1940 edition) have a direct bearing on the tax status of rebuilt generators and other automobile parts and accessories:

"SEC. 316.4. *Who is a manufacturer.*—The term 'manufacturer' includes a person who produces a taxable article from scrap, salvage, or junk material, as well as from new or raw material, (1) by processing, manipulating, or changing the form of an article, or (2) by combining or assembling two or more articles.

"Under certain circumstances, as where a person manufactures or produces a taxable article for a person who furnishes materials and retains title thereto, the person for whom the taxable article is manufactured or produced, and not the person who actually manufactures or produces it, will be considered the manufacturer.

"A manufacturer who sells a taxable article in a knockdown condition, but complete as to all component parts, is liable for the tax, and not the person who buys, and assembles a taxable article from, such component parts."

* * * * * * *

"PARTS AND ACCESSORIES

"[SEC. 3403. *Tax on automobiles, etc.*]

"[There shall be imposed upon the following articles sold by the manufacturer, producer, or importer, a tax equivalent to the following percentages of the price for which so sold:]

* * * * * * *

"(c) Parts or accessories (other than tires and inner tubes) for any of the articles enumerated in subsection (a) or (b), 2 per centum. For the purposes of this subsection and subsections (a) and (b), spark plugs, storage batteries, leaf springs, coils, timers, and tire chains, which are suitable for use on or in connection with, or as component parts of, any of the articles enumerated in subsection (a) or (b), shall be considered parts or accessories for such articles, whether or not primarily adapted for such use. This subsection shall not apply to chassis or bodies for automobile trucks or other automobiles. * * *

"SEC. 316.55. *Definition of parts or accessories.*—The term 'parts or accessories' for an automobile truck or other automobile chassis or body, taxable tractor, or motorcycle, includes (a) any article the primary use of which is to improve, repair, replace, or serve as a component part of such vehicle or article, (b) any article designed to be attached to or used in connection with such vehicle or article to add to its utility or ornamentation, and (c) any article the primary

use of which is in connection with such vehicle or article whether or not essential to its operation or use.

"The term 'parts and accessories' shall be understood to embrace all such articles as have reached such a stage of manufacture that they are commonly or commercially known as parts and accessories whether or not fitting operations are required in connection with installation. The term shall not be understood to embrace raw materials used in the manufacture of such articles.

"Spark plugs, storage batteries, leaf springs, coils, timers, and tire chains, which are suitable for use on or in connection with, or as component parts of, automobile truck or other automobile chassis, taxable tractors, or motorcycles, are considered parts of or accessories for such articles whether or not primarily designed or adapted for such use.

"SEC. 316.56. *Rate of tax.*—The tax is payable by the manufacturer at the rate of 2 percent (2½ percent for the period July 1, 1940, to June 30, 1945, inclusive) of the sale price as determined under sections 316.8 to 316.15, inclusive.

"EXEMPT SALES OF PARTS AND ACCESSORIES

"[SEC. 3403. *Tax on automobiles, etc.*]

"(c) * * * Under regulations prescribed by the Commissioner, with the approval of the Secretary, the tax under this subsection shall not apply in the case of sales of parts or accessories by the manufacturer, producer, or importer to a manufacturer or producer of any of the articles enumerated in subsection (a) or (b) If any such parts or accessories are resold by such vendee otherwise than on or in connection with, or with the sale of, an article enumerated in subsection (a) or (b) and manufactured or produced by such vendee, then for the purposes of this section the vendee shall be considered the manufacturer or producer of the parts or accessories so resold.

"SEC. 316.57. *Parts and accessories sold to manufacturers.*— No tax will be imposed upon parts or accessories sold to a manufacturer of automobile truck or other automobile chassis, bodies, taxable tractors, or motorcycles, provided the vendor obtains from the purchaser, and retains in his possession as provided in section 316.21, a certificate of the purchaser establishing that the purchaser is a manufacturer of such articles.

"Under section 3442, sales of parts or accessories to another manufacturer of parts or accessories for use in the manufacture or production of parts or accessories are likewise exempt, when supported by exemption certificate as provided in section 316.21.

"If the purchaser uses or resells parts or accessories purchased by him tax free, he shall be considered the manufacturer, and must pay the tax thereon or in the case of resale establish by exemption certificate on file that his sale was tax free.

"Jobbers or dealers and others who are not manufacturers of taxable articles are not entitled to purchase tax free. In case a manufacturer of both taxable and nontaxable articles uses parts or accessories purchased tax free under certificate in the manufacture of a nontaxable article, he is liable for tax on the parts or accessories so used based on the fair market price determined as provided in section 316.15."

Mr. THOMPSON. My name is Robert R. Thompson, Mr. Chairman. I wish to outline my experience with the Internal Revenue Bureau on the excise tax.

When this excise tax began in June of 1932 we consulted our attorney as to whether we were taxable, and he informed us that our business was of a repair nature and therefore, we were not taxable. This same contention was held by other concerns in our locality.

In 1934 two deputy collectors from the Newark office called on us and inspected our books and our method of operations. They told us that they would explain our business to their superior in Newark and advise us whether we were subject to this tax. Upon their return, they informed us that our business was repairs and not one of manufacture and we were not taxable.

In July 1937 two different deputies from the New York office called on us and advised us that we were subject to this tax. They assessed us from June 1932 to July 1937, basing their figures on the exchange prices, which means the actual receipts received by us for repairing.

During the course of the next year we had many conferences with the Bureau, but no settlement was arrived at. In August 1938 another deputy from the Newark office audited our books for the year July 1, 1937, to July 1, 1938. The basis of the audit was the same as made by the New York deputies. Before leaving, this deputy drew up a work sheet computing the tax due for the month of July 1938. Commencing with that month we have filed and paid taxes exactly as shown us by the deputy. As we were not in a financial position to pay the total amount of back taxes assessed against us, the Bureau, in November 1939, accepted an offer in compromise of approximately 50 percent. Even this reduced amount was a great hardship for us, but we managed to make a final payment in December 1940.

In March 1941, an agent of the Bureau, working directly out of Washington, called on us, and after examining our books, told us, much to our surprise, that we were not correctly computing the amount of taxes due, as we did not include, for tax purposes, the value placed on the old unit taken in exchange, but were paying only on the actual amount received by us to cover the cost of repairs. This agent then proceeded to set up additional taxes for the period, July 1938 to February 28, 1941.

In March 1941, at a conference before Deputy Agents Leopold and Garwin here in Washington, I protested strongly against this proposed additional tax, as I felt the Bureau was not consistent or justified in their ways of taxing our articles. My protest was to no avail and the additional tax was assessed.

This, gentlemen, I want to bring out to you, that we have all these methods of taxing our articles. First, there was no tax. Then a tax only on the repairs, and now a tax on the repairs plus the value of the articles received in trade.

The CHAIRMAN. Is there anything further?

Mr. DOCKWEILER. Mr. Chairman, may I say a few words? I want to explain our postion here. We came up to Washington here, we came to see Assistant Secretary Sullivan, we explained our position and explained to him that the work done by these repairers was repair work and not work of manufacture. He sent us to Mr. Helvering, and Mr. Helvering sent us to Mr. Christie. Mr. Christie had some gentlemen, who were supposed to be experts. Well, finally, Mr. Christie sent us to two gentlemen who went into it in detail and we explained the operations, and so forth. I am not quoting anybody, but we went away with the impression that everything was all right.

Later on, the Bureau and Mr. Sullivan seemed to be of the opinion that this matter could be arranged by regulation, an Internal Revenue regulation.

Now, Mr. Chairman, we want protection against regulation in this matter. If it is possible at all, if it is fair and just and proper, we want this amendment, or if the language of the amendment is inappropriate in any detail, we would like to have the appropriate language inserted, just as radios are excluded and as tires and inner tubes are excluded, we want this special repair work to be definitely excluded by legislative action.

In California, in my district at Los Angeles, the collector of Internal Revenue, a splendid public official, is however, imposing a tax upon some of these people. They are going back on their books 4 or 5 years,

6 years, and if this method that is being exercised in our district is followed all over the United States, the United States Government will have, as owners, a lot of repair shops; throwing out of business two or three or four or five men in each shop who are earning a living for themselves and their families.

In the San Francisco district, the repairers there are informed by the Internal Revenue Bureau officials that there is no tax to be imposed, for the reason that these repairers are repairers and not manufacturers. Of course, they have the correct attitude. In other sections of the United States, in only a few as compared to the balance of the United States, the imposition of taxes has been made, and in the majority of districts there has been so far no imposition of the taxes. This affair, dealing with the repairers, that is the alleged law or regulations, has been unfairly and improperly—I am not ascribing any improper motive, but it has been unfairly handled.

Senator CONNALLY. May I interrupt you, Mr. Dockweiler?

Mr. DOCKWEILER. Yes, Senator.

Senator CONNALLY. Do they tax them just on the cost of the particular part that goes into the repairs?

Mr. DOCKWEILER. They impose a tax in one case on the $1.10 charged for repair, and then the $5 deposit, which is immediately returned or credited to the garageman upon the return of the old and disabled part. That would mean, say, 5 percent, 5 times 6 that is 30, and we are paying 30 percent instead of 5 percent on $1.

Of course, I would like to hear the answer of the Treasury Department. We are at a disadvantage in not being able to find out what their attitude and position is, but we think that the case is sufficiently grave to justify the enactment of an amendment to this statute so that the law and the procedure is already laid down for the gentlemen in the Internal Revenue Bureau.

Now, you all realize better than I do, that the American people are going to be obliged to pay taxes such as their fathers and grandfathers and great-grandfathers were never called upon to pay, and therefore, it is most important that the administrators of our tax assessments, of our tax legislation, should be fair and courteous and kind and considerate to the people who pay, and that a rule should not be enforced in one district which is not enforced in another district. We feel that, under the circumstances, this amendment, or some other appropriate language, should be used to protect the repairers.

The CHAIRMAN. We have your point, Mr. Dockweiler.

Mr. DOCKWEILER. Thank you.

Mr. EINZIG. Thank you very kindly.

The CHAIRMAN. Mr. Harcourt Amory.

STATEMENT OF HARCOURT AMORY, BOSTON, MASS., CHAIRMAN, COMMITTEE ON FEDERAL TAXATION, INVESTMENT BANKERS ASSOCIATION OF AMERICA

The CHAIRMAN. Will you give your name to the reporter?

Mr. AMORY. Harcourt Amory of Boston, representing the Investment Bankers Association of America.

The CHAIRMAN. Have you a prepared brief?

Mr. AMORY. I have, sir.

The CHAIRMAN. Do you wish to read it or put it in the record?

Mr. AMORY. I would prefer to read it.

The CHAIRMAN. How long will it take you to cover it?

Mr. AMORY. It will take us about 20 minutes, sir, I think. We will try to make it as brief as possible, but as it is a general plan, it is a little hard to condense it much.

The CHAIRMAN. Will you state exactly to what point in the act you are speaking, so we may follow you?

Mr. AMORY. We are speaking to the general act. We have a general tax proposal.

Senator CONNALLY. A complete substitute for the bill?

Mr. AMORY. Not a complete substitute for the bill, but it covers all factors in the bill, sir.

The CHAIRMAN. It covers all the taxes?

Mr. AMORY. No; but in a general way, it does, Senator.

Senator GUFFEY. How much revenue does your plan raise?

Mr. AMORY. It raises about $600,000,000 more than the House, it raises $3,800,000,000.

Senator CONNALLY. Is that a sales tax?

Mr. AMORY. Something along that line, sir.

Senator CONNALLY. I suspected that.

Mr. AMORY. It has got a different name.

The CHAIRMAN. Proceed. Make it as brief as you can. Since you have a written brief, you could put it in the record and simply talk to us offhand about your program.

Mr. AMORY. I will delete, wherever I can, Senator George.

The CHAIRMAN. Yes.

Mr. AMORY. The Investment Bankers Association of America, represented by its Committee on Federal Taxation, respectfully submits a tax program. The association has no special axe to grind and has taken the broad view that what is, over the long pull, good for the Government, will, over the long pull, be good for the taxpayer and business, including the investment banking business.

1. *Income tax on individuals.*—Our association believes in graduated income taxes on individuals and is of the opinion that this tax should be one of our principal sources of revenue in normal times. However, experience has shown that in times of severe depression it cannot always be one of the principal sources of revenue.

For example, although on the average, income-tax rates were approximately doubled in 1932, nevertheless for the fiscal year ending June 30, 1933, the total revenue collections from individual income taxes (including back tax collections for prior years) were only $352,573,620. In this same fiscal year the Federal Government collected from tobacco taxes alone, $402,739,059 or $50,165,439 more than was collected from individual income taxes.

Senator BARKLEY. You are just $300,000,000 off on the tobacco taxes. The tobacco taxes are $723,000,000.

Mr. AMORY. This is for the fiscal year 1933, sir.

Senator BARKLEY. I beg your pardon.

Mr. AMORY. On the other hand, in a time of high national income, like the fiscal year 1929, even at low-income tax rates, the Government collected from individuals more than three times the revenue it collected in 1933, and income tax collections from individuals were over 2½ times tobacco-tax collections.

In view of the extreme fluctuations which take place in Federal income tax collections, depending largely on and magnifying fluctuations in national income, the Investment Bankers Association believes that a scientific schedule of income tax rates and surtax rates should be worked out for normal times based on a reasonable cost of running the Government in such times, including interest costs, costs of maintaining our Army and Navy at proper effectiveness, and costs for a conservative amortization of the National debt. In preparing such a standard schedule of rates, we believe careful regard should be given to preserving the profit motive of our citizens, thus giving them the incentive to work, invest and produce. Consideration should also be given to broadening the base of our income tax by lower exemptions.

Senator CONNALLY. Right there, how low do you want to put it?

Mr. AMORY. The Treasury Department suggested $750 for individuals and $1,500 for married couples. That would seem to be a reasonable base.

Senator CONNALLY. I was just wondering. You said you were going to substitute a bill. You would not put it any lower than that, eh?

Mr. AMORY. I do not believe you could do it at this time, sir. No.

Senator CONNALLY. Hardly.

Mr. ARMORY. Great Britain has, for many years, used an income tax system with a broad base with the results that proportionately more revenue has been secured and the tax has been much more stable in yield through good times and bad. For example, a comparative study of the British income tax revenue and our Federal income tax revenue, made some years ago during peacetimes, showed, during the 11-year period 1923 to 1933, inclusive, that British income tax revenue varied from a minimum of $1,436,000,000 to a maximum revenue of $1,936,000,000, while in the United States, the minimum revenue secured in this 11-year period was $747,000,000 while the maximum revenue amounted to $2,842,000,000. In other words, in Great Britain the maximum revenue was only 35 percent above the minimum revenue, while in this country the maximum revenue was 280 percent above the minimum revenue.

Thus we are certain that broadening the income tax base would not only result in more revenue, but would make the yield from this source more stable. We believe that stability is greatly to be desired. Our association is also of the opinion that persons having net incomes of from $2,000 to $10,000 annually could pay considerably more tax than proposed in the bill. It should be noted in this connection that the Treasury Department has recommended higher taxes on such incomes.

Having set up a standard schedule of rates, it is suggested that additional revenue requirements be met, so far as individual income taxes are related to the total tax burden, by adding to the tax computed at the standard rates, a certain percentage in times of need, or by subtracting from such standard tax a certain percentage when the Government does not require as much revenue as this standard schedule of rates are imposed should also be standardized.

Such a policy, if carried out, would give certainty, and certainty is one of the cardinal principles of sound tax legislation. This is especially true if we are to have, as we have had during recent years,

taxing statutes which are retroactive over a period of from 5 to 9 months.

2. *Income taxes on corporations.*—According to the Budget message of the President, total income taxes in the fiscal year ending June 30, 1942, will amount to $4,509,500,000 under the law as amended by the Revenue Acts of 1940.

Leaving out of account back tax collections, declared-value excess-profits tax and unjust enrichment tax, the income tax on individuals was estimated to yield $1,604,000,000 and the income and excess profits taxes on corporations, $2,614,000,000. The House bill proposes revisions in rates and in provisions affecting the tax yield which are estimated to result, over a full year of operations, in added revenue from individual income tax of $829,000,000 and from corporate income and excess profits taxes of $1,322,900,000. Thus, under the House plan, our tax system is estimated to yield $2,433,000,000 from income tax on individuals and $3,936,900,000 from income and excess profits taxes on corporations. From the above, the importance of income taxes on corporations is evident since such taxes are expected to yield over 1½ billion dollars more than the income taxes on individuals.

It appears to us that the Federal income tax system applying to corporations is entirely too complicated and places a tremendous burden of expense on corporations in the way of accounting costs and expert advice.

If the existing law is revised as proposed by the House bill, there will be the following taxes of general application imposed on corporations:

1. Normal tax 24 percent.
2. Surtax 5 and 6 percent.
3. Excess profits tax, graduated 35 to 60 percent.
4. Special 10 percent tax based on relation between current year earnings and base period earnings.
5. Declared value excess profits tax, 6 and 12 percent.
6. Defense tax (10 percent added).

In addition to the above, corporations must generally live under the fear of the heavy tax imposed under section 102 in the case of an unreasonable accumulation of surplus (rates 25 and 35 percent). There are, as well, other more specialized income taxes besides numerous excise taxes. Thus, the tax burden on corporations is much heavier than would appear from the consideration of income taxes only.

A corporation is an artificial person. It does not of itself have a heart, or a soul, or feelings, but its stockholders have all of these things. Corporations represent cooperative enterprises and their existence has made it possible for our citizens of small means to invest their money in business, whether those businesses be large or small. The citizens of small means are more likely to invest in the securities of large companies than in those of small ones. This is not an assumption; it is a fact borne out not only by the records of members of our association, but by the experience of various investment services.

In view of this, while our association does not wish to criticize, we are at a loss to understand why the present excess-profits tax has dollar brackets instead of percentage brackets. It seems clear to us that the present system reacts more unfavorably on the small investor than on the large investor. For example, under the proposed bill, if a corporation has an adjusted excess-profits tax net income of

$100,000, it will pay a tax of $41,500, or an average rate of 41.5 percent. On the other hand, if a corporation has an adjusted excess-profits net income of $1,000,000, it will pay a tax of $554,000, or an average rate of 55.4 percent. This will occur in spite of the fact that both realize the same percentage of profit on their invested capital and in spite of the fact that the first corporation may have only one stockholder and the second hundreds of stockholders.

The list which has been given shows that there are six income taxes of general application imposed on corporations. We have no suggestions to make with respect to the normal tax upon corporations and believe this tax should be adjusted to account for the main portion of the revenue yield expected from corporations. We think it would have been better to have imposed a uniform tax on corporations of 30 percent, than to have arrived at practically the same result through the surtax, which appears to have been designed principally for the purpose of placing a tax on partially tax-exempt interest from Government securities.

We now come to the excess-profits tax first imposed by the Revenue Act of 1940 and subsequently amended and now proposed to be again amended. This is probably the most difficult tax of all taxes to design in a manner which will produce equitable results. However, we recognize the Government's need for revenue and also the desirability of preventing profiteering during this period when we are concentrating on enormously increasing our defenses. We can only say that we think this tax should be made as equitable as possible by means of relief provisions, by retaining both the average-earnings method and the invested-capital method of computing excess-profits tax, and, as before stated, by changing the brackets from dollar brackets to percentage brackets. We also think it should be made plain, in view of the unsatisfactory nature of the tax, that this is a temporary tax to be eliminated when the present emergency is over.

With respect to the declared-value excess-profits tax, we believe that this tax should be simplified and, in view of the fact that there is now another excess-profits tax to take care of profiteering and extraordinary profits, that the rates imposed by such declared-value excess-profits tax should merely be high enough to insure the declaration of a fair capital stock tax value, thus avoiding too high a penalty on a wrong guess as to future profits. We believe that the rates established in 1933 accomplished this purpose.

As to the defense tax, which is computed by adding 10 percent to certain other income taxes, we do not think that this is objectionable because it is so easily computed.

Finally, we believe it would be of great benefit to standardize provisions dealing with the computation of net income so that there would be certainty at least as to method in the case of corporate taxes. The importance of maintaining such a standard method of computing taxes, we believe, cannot be overestimated. It will give business the courage to go ahead.

3. *Estate and gift taxes.*—The estate- and gift-tax rates have been substantially raised during the last 8 years and it is now proposed to make a still further increase in rates. It is difficult to see why a man should be penalized for dying in a depression or in a national emergency. We endorse the estate tax and the gift tax, but believe that they should be imposed at rates which could be kept practically

constant. Your attention is also drawn to the fact that the estate tax is ill-adapted for use in an emergency. This is because the tax is not due until 15 months after the date of the decedent's death, and the Commissioner is empowered to grant extensions of time for the payment of the tax, allowing as much as 10 years from the due date for such payment.

We oppose the new rates on gifts, believing that the high rates proposed would discourage gifts and therefore that we will secure less money from this source than if more reasonable rates are retained.

Senator BARKLEY. Of course, that deferred payment may be for some time on the books, but we would gain by the taxes we raised even before the 10 years expired.

Mr. AMORY. Well, we have a suggestion to cover that a little later on here.

4. *Capital stock tax.*— This tax is practically a capital levy, although technically it is an excise tax on the privilege of doing business. The tax is imposed on all corporations doing business whether or not they have any net income. It is dangerous and unfair to raise the rate imposed by this tax to too high a level. The present rate is $1.10 per $1,000 of declared capital stock tax value. The rate now proposed is $1.25 per $1,000. In view of the estimate of only $22,300,000 from this increase, our association believes the present rate should be retained.

Senator CONNALLY. Your association generally deals in stocks?

Mr. AMORY. Sir?

Senator CONNALLY. You deal in stocks? You sell bonds and stocks, do you?

Mr. AMORY. Yes, sir. Bonds and stocks.

Senator CONNALLY. All right.

Mr. AMORY. 5. *Taxes on tobacco and tobacco products.*—These taxes are on nonessentials and while they are now high, they are very much lower than the taxes imposed on such items by most countries. Tobacco taxes are very productive of revenue. The tax on cigarettes alone is estimated to yield $638,000,000 in the fiscal year 1942, even though the House bill proposes no rate increases on tobacco or tobacco products.

Senator CONNALLY. Do you advocate an increase?

Mr. AMORY. We do. We are coming to specific suggestions a little later.

Senator BARKLEY. You are advocating an increase. Do you take into consideration the fact that tobacco and tobacco products, which constitute a very considerable portion of agriculture in this country, are the only products, or the only items in the old tax system that continued to bear the World War taxes after the World War was over, and that that reflected upon the grower of this product whose price is frequently beaten down because the purchasers of it say they cannot pay any more because of the tax? Have you taken that into consideration?

Mr. AMORY. We have, sir. We are not recommending increases of taxes on cigars or chewing tobacco, but we believe, particularly, under the present conditions in this country, where the average fellow is pretty well fixed, working in defense industries, he is not going to question at all paying a slight fraction more for cigarettes.

Senator BARKLEY. I am not going to argue that with you now.

Mr. AMORY. 6. *Liquor taxes.*—Here again we have taxes on nonessentials and we believe the tax rates should be adjusted, as in the case of tobacco. The House bill proposes to increase the taxes on distilled spirits and wines but does not increase the tax on beer. There are revenue possibilities in a further increase in these taxes.

7. *Manufacturers' excise taxes.*—At the present time, we have a fairly reasonable list of excise taxes on specific items such as gasoline, lubricating oil, tires and tubes, electrical energy, cosmetics, and so forth. The House bill proposes to add a considerable number of new excise taxes and also proposes to increase the tax on some of the excises now in existence. With respect to this subject, we believe that nuisance taxes on items producing only a few million dollars of revenue should be eliminated unless such taxes are necessary to put business on a fair competitive basis or to retard the consumption of materials necessary for the defense program.

8. *Miscellaneous taxes.*—We have no suggestions to make on these taxes at this time.

9. *Miscellaneous receipts.*—It is unnecessary for us to discuss receipts from Social Security and employment taxes, or from customs, rents and royalties, permits and licenses, interest, fees, forfeitures, reimbursements, sale of Government property, and realization upon assets, since no change is expected or suggested with regard to such items.

The point has now been reached where it seems advisable to summarize the total receipts of the Federal Government as estimated under existing law—the increased revenues expected from the House bill proposals, and finally, the total of these two classes, which shows the total estimated receipts from existing law as proposed to be amended by the House bill. Such a summary will be found in exhibit I, attached to this statement. A condensed tabulation of the totals shown in the summary referred to is as follows:

Kind of tax or source of revenue	Estimated revenue receipts		
	Budget estimate for fiscal year 1942	Added by House bill	Total annual revenue from revised system
Income taxes	$4,509,500,000	$2,151,900,000	$6,661,400,000
Estate, gift, and capital stock taxes	567,900,000	174,200,000	742,100,000
Tobacco taxes	716,630,000	0	716,630,000
Liquor taxes	839,500,000	127,300,000	966,800,000
Stamp taxes	39,980,000	1,000,000	40,980,000
Manufacturers' excise taxes	666,400,000	386,600,000	1,053,000,000
Miscellaneous taxes	198,925,000	365,200,000	564,125,000
Employment and old-age benefit taxes	961,300,000	0	961,300,000
Total, internal revenue	8,500,135,000	3,206,200,000	11,706,335,000

Our association has the following comments to submit with respect to the proposed tax burden:

First. With respect to income taxes, the bill is drawn so as to be retroactive to the 1st of January 1941. It seems generally conceded that the bill will not pass and become law until September 1941. This means that the bill will be retroactive over a period of nearly 9 months. During this period thousands of business transactions will have taken place and the taxpayer will be in the dark as to how he is to be taxed thereon. Doubtless, other thousands of transactions

will be delayed and, in many instances, never take place on account of the uncertainty which exists. Thousands of individuals living on a salary, not realizing the degree to which their taxes will be increased, will fail to put enough aside to meet their tax payments March 15 next. Corporations will be afraid to spend money in plant expansion when they do not know how much of that money must be retained to meet tax payments. Moreover, new features have been added to their tax troubles, such as the reversal of the present system of crediting normal tax against excess profits tax net income, and such as the new 10 percent special tax. The average tax increase proposed in all income taxes amounts to almost 48 percent.

In view of the above, with full realization of the fact that the Government must substantially increase its revenue, our association believes that the increase in income taxes is too sudden, especially in a retroactive law, and that it would be better to be satisfied with a total increase from income taxes of 40 percent instead of the 48 percent proposed. Of course, this would reduced the increased yield from income taxes proposed in the House bill from $2,151,900,000 to $1,803,800,000, or a loss of $348,100,000. However, we believe this loss can be made up with less disruption of our national economy from other sources. Moreover, we recommend lowering the personal exemptions so as to bring in more taxpayers and increase tax consciousness and also recommend increasing to some extent surtax rates up to $10,000 which we believe are somewhat too low in the House bill. Reasonable changes in exemptions and rates as suggested should account for $100,000,000 of additional revenue, really giving us, instead of $348,100,000, the sum of $448,100,000 with which to make improvements in the bill. The main features which we believe should be modified in this bill and which we believe can be accomplished with the 448,000,000 just mentioned are as follows:

1. The proposition of computing the excess-profits tax on the entire net income and then computing the normal tax on such net income after the deduction of the excess-profits tax seems illogical and reverses the rule of present law which is believed sound.

2. The excess-profits-tax brackets should be expressed in percentages instead of dollars as previously explained.

3. The surtax schedule should be revised and standardized as before mentioned.

4. Reasonable expenses in the management of property should be allowed. Such allowances were granted by the Treasury Department for many years, but since the *Higgins case*, the policy has been changed and the deductions disallowed. If our concept of a fair base of taxation is net income rather than gross, then we should certainly allow expenses necessary in the production of net income.

5. Numerous minor adjustments should be made in the computation of net income in order to produce greater equity. For example, consideration might well be given to alimony payments, a substantially greater credit for earned income, and an extension of the $400 credit for dependents to cover children between 18 and 21 attending college.

Second. Turning our attention now to estate, gift, and capital-stock taxes, we find (by reference to exhibit I) that it is proposed to increase the estate-tax burden by 39 percent, the gift-tax burden by 49 percent and the capital-stock-tax burden by somewhat over 11

percent. There is a real danger in breaking up going and well-managed businesses through the operation of too heavy an estate tax. We suggest, during the present emergency, keeping the rates as in the existing law and adding 30 percent to the tax as computed under such rates with a maximum limit to prevent confiscation. However, we believe the estate should be entitled to receive for this additional 30 percent tax 10-year nonnegotiable Government bonds bearing 2 percent interest. This would be something like the British plan of compulsory loans from taxpayers brought about through the power of taxation. We suggest the same with respect to the gift tax.

Senator CONNALLY. You mean if you tax them 30 percent, you would pay it back in 10 years?

Mr. AMORY. Yes, that answers the question that Senator Barkley asked earlier.

Senator CONNALLY. You would not get much money out of it.

Mr. AMORY. I hope we would have a reservoir of capital in 10 years which might be very useful to the country at that time.

Attention has already been called to the fact that too high rates will result in an embargo on gifts and no money will come into the Treasury in such a case. The unfairness of a high capital-stock tax rate has already been discussed and we believe the present rate should be retained. The loss of present revenue from these changes should not exceed $50,000,000 over the House bill proposals.

Third. With respect to the taxes on tobacco and tobacco products, these are expected to yield $716,630,000 in the fiscal year 1942. The House bill makes no increases in these taxes. In our opinion, these taxes could be increased at least 7½ percent on cigarettes (that is, to 7 cents per package of 20) without coming anywhere near the point of diminishing returns. If this were done, we would secure about $48,000,000 more than is proposed by the House bill from this source.

Fourth. With respect to the taxes on liquor, wine, and beer, these are expected to yield, after the increases proposed by the House bill, $977,600,000. We believe distilled spirits could easily be taxed $1 per gallon more in addition to the $1 per gallon increase proposed in the House bill. This change would bring in about $100,000,000 of additional revenue. We also believe the tax on beer, ale, and so forth, could be increased $1 per barrel without any harm being done, in spite of the fact that the House bill proposes no addtional tax on these products. This would bring in a total of about $50,000,000 of additional revenue. The total added revenue from the suggested changes in rates on distilled spirits and beer would therefore amount to about $150,000,000 more than the House bill proposes to obtain from this source.

Fifth. With respect to stamp taxes estimated to yield $40,980,000 we suggest no changes. The only change made in the bill is an increase in the stamp tax on playing cards.

Sixth. Attention is now drawn to manufacturers' excise taxes. These taxes as proposed by the House bill are expected to yield $1,053,000,000. This represents an increase over existing law, on account of the increased rates and new items proposed of about 60 percent. We suggest eliminating a few of the new nuisance taxes yielding less than $19,000,000 and hardly paying for the cost of their administration.

The gasoline tax is the most productive tax in this group of manufacturers' excise taxes. A tax increase of 1 cent per gallon would raise nearly $260,000,000. We suggest this increase in spite of the heavy taxes imposed on this product by the States because we do not believe either the industry or the consumer will be seriously affected.

Senator TAFT. One cent instead of a half cent in the bill.

Mr. AMORY. A tax increase?

The CHAIRMAN. There is no increase.

Mr. AMORY. There is no increase in the present bill.

Seventh. We have no comments to make with respect to miscellaneous taxes expected to yield $564,125,000 under the proposed bill.

Let us now compare the receipts expected from the House bill plan with the receipts expected from our plan as so far presented.

Kind of tax	Estimated revenue receipts	
	House bill plan	Investment Bankers Association plan
Income taxes	$6,661,400,000	$6,313,300,000
Estate, gift, and capital-stock taxes	742,100,000	692,100,000
Tobacco taxes	716,630,000	764,630,000
Liquor taxes	966,800,000	1,116,800,000
Stamp taxes	40,980,000	40,980,000
Manufacturers' excise taxes	1,053,000,000	1,294,300,000
Miscellaneous taxes	564,125,000	564,125,000
Employment and old-age benefit taxes	961,300,000	961,300,000
Total, internal revenue	11,706,335,000	11,747,535,000

Thus, our association plan produces more than $41,000,000 in excess of the House bill. It is true that the Ways and Means Committee bill produced $323,000,000 more than the sum provided for by the House. This came about through the elimination of the compulsory joint return—a change which we strongly endorse. The Treasury recommended, as an amount necessary to raise through additional taxation, the sum of $3,500,000,000.

That was the Secretary's estimate here Friday, I believe.

To accomplish this purpose, we make a serious suggestion which we believe will produce the required amount and much more without disturbing our national economy.

We suggest a purchase tax similar to the one now employed by Great Britain. What is this tax? Perhaps the best general idea can be gained by quoting as follows from a report to the Joint Committee on Internal Revenue Taxation on the subject of British and Canadian Tax Systems, prepared by Mr. B. C. Brown of its staff and approved by Mr. Colin F. Stam, Chief of Staff, under date of May 21, 1941:

The purchase tax.—The United Kingdom incorporated a purchase tax, or general sales tax, in its taxing system in September 1940. Prior to that time, the British had relied upon the so-called ability to pay taxes, customs and excise taxes on selected articles, for revenue.

Its adoption was based on the "urgent and imperative need both to limit civilian consumption and also to obtain a new source of revenue." It was considered necessary to levy a tax on personal expenditure, or upon the ability to buy, to supplement the existing taxing structure.

The tax was imposed on the transfer from registered dealers (generally wholesalers) to unregistered purchasers and was based upon the wholesale value. Thus the tax falls but once and pyramiding is avoided.

The principles of its application were clearly indicated. Goods were classified into three categories. In the first class, which was to be entirely exempt from the tax, were placed the goods which were considered absolute necessities for people with very limited buying power. This classification includes such expenditures as those for rent, food, gas, electricity, education, domestic wages, coal, children's clothing, machinery and equipment used for farming, and certain medicines and medical appliances. It was considered that these were goods that everyone must acquire.

The second classification was subjected to a reduced rate of 16⅔ percent of the wholesale price, which is said to represent about 12 percent of the retail price. The goods included in this category may be said to fall between the classification of necessities and the luxury classification. It was designed to include goods not in the category of luxuries but which, to acquire, necessitates greater ability to buy than that possessed by the lower income groups.

The third category was designed to include goods in the nature of luxuries, or goods the replacement of which could be postponed until better times. Such goods are likely to be acquired during the war emergency chiefly by people with ample ability to buy. Such goods as furs, real silk, china, jewelry, toilet preparations, and cosmetics were included in this classification, which was subjected to a full rate of 33⅓ percent of the wholesale price, said to represent about 24 percent on the retail price.

Thus it was expected that the tax would constitute a source of considerable revenue and at the same time restrict consumption of those goods most likely to compete with production for the war effort.

It was estimated by the Government that of a national income of approximately $20,000,000,000 only about 20 percent would be affected by the tax, and would produce annually 110,000,000 pounds or about $440,000,000.

The national income for the United Kingdom for the year 1940–41 has been officially estimated at $22,344,000,000. For the period 1941–42 the national income of the United States has been officially estimated at $95,000,000,000. Thus, the national income of the United States is four and one-fourth times the national income of the United Kingdom. We believe that the receipts from the purchase tax would be practically in proportion to the national income.

Senator CONNALLY. If you tax them as heavily as the English, 16⅔ percent——

Mr. AMORY (interposing). No, sir; we do not plan that.

Senator CONNALLY. It would not be four times as much.

Mr. AMORY. The national income is four and one-fourth times as much.

Senator CONNALLY. I know.

Mr. AMORY. If we use the same rate, we get four and one-fourth that is what I say.

Senator CONNALLY. You say four and one-fourth times?

Mr. AMORY. That is right.

Senator CONNALLY. All right.

Mr. AMORY. Inasmuch as the British tax is estimated to produce £110,000,000, or $440,000,000, it seems that we could expect from the same kind of tax here, levied at the same rates, a revenue of $1,870,000,000.

Of course, we would not recommend at present adopting such high rates as are used in Great Britain. However, if we should adopt a standard rate of 10 percent, corresponding to the British rate of 33⅓ percent, and a rate of 5 percent, corresponding to the British rate of 16⅔ percent, we could still figure by means of a purchase tax to obtain additional revenue of $561,000,000. Thus, we would obtain from our plan previously outlined, together with a purchase tax, levied at rates of 5 and 10 percent, $602,200,000 more than is provided for under the House bill, or a total increased revenue of approximately $3,800,000,000.

We believe such a tax is practical and would be beneficial in curtailing civilian consumption, especially of materials and services necessary for the defense program.

Senator VANDENBERG. Would this be in addition to the excise taxes on the same commodity?

Mr. AMORY. It would during the present emergency, Senator Vandenberg; yes.

Before concluding, we also respectfully suggest that you give study to the possibilities of an excess-profits tax on individuals. This might be properly levied on wage and salary increases after the date of the enactment of the act. Such a tax placed at 10 percent of the annual net income increase, would be a substantial revenue producer and would make those individuals fortunate enough to benefit directly or indirectly from the defense program contribute a small share of the benefits received to the Government. The unusual profits of corporations due directly or indirectly to the defense program are taken care of by an excess-profits tax. Profits of individuals and partnerships of any substantial size are taken care of by heavy surtaxes, but the average wage earner contributes under the proposed bill little, if anything, toward the defense program from which he benefits. A reasonable tax on wage increases during this emergency period would, we believe, be justified and would not decrease the wage earner's standard of living since it is only proposed to put a moderate tax on the increase in his annual income.

Senator VANDENBERG. Let me ask you a question at that point.

Mr. AMORY. Yes, sir.

Senator VANDENBERG. I think that is the way to most directly reach the person who has surely the benefit from the defense program, is it not? By exploring the subject with the Treasury Department and with the Joint Comimttee staff, we run into numerous administrative problems. Let me ask you what you would do about this, because I think it is fundamental: What would you do with individual excess-profits taxes? How would you apply them to the wage earner who has no previous wage-earning record?

Mr. AMORY. We suggest an average date on the enactment of the act which gives us a base. This would not apply until salary increases were made in September, from next month on.

Senator VANDENBERG. The new wage earner would just come in, but we would have no previous experience.

Mr. AMORY. I do not see how we could possibly get him, Senator Vandenberg, unless you try some method of having him make a declaration of income under oath, which would be pretty loose, I should think.

Senator BARKLEY. How would you apply it to a man whose employment is not regular, even though he is working in some industry benefited by the defense program?

Mr. AMORY. Such as a carpenter, for instance, Senator Barkley?

Senator BARKLEY. Yes.

Mr. AMORY. We think it should apply to him definitely. He is making, perhaps, three times his normal income.

Senator BARKLEY. If he works all the time, that is true?

Mr. AMORY. If he works all the time?

Senator BARKLEY. Suppose he only works part of the time and you compare the amount of employment and wages with the previous

amount of wages and employment, how could you figure that out? I can understand where a man, working every day, or substantially all the time in 1940, and works all the time in 1941 and gets an increase. I can understand how you could estimate it.

Mr. AMORY. I think there are a lot of difficulties.

Senator BARKLEY. Suppose he works only half time in 1941, or two-thirds of the time, or three-fourths of the time, in either of those years, 1940 and 1941, how are you going to estimate the amount, as to whether that represents the excess salary or earnings?

Mr. AMORY. Would not you have the total amount for the year? Supposing he gets $1,500 in 1940 and $4,000 in 1941, whether he works continually or not, could not you estimate that?

Senator BARKLEY. I assume that would be the difference; it would be a substantial difference, but suppose he got $2,000 in 1941 and maybe $2,500 or even $1,500 in 1941, based upon the number of days or months that he worked, you would find administrative difficulty there.

Mr. AMORY. I think so, Senator. We are making this as a general suggestion for study, because there are obviously a lot of hitches in the plan. I assume you would have to make exemptions for civil-service employees who are on an annual step-up. They are going to be caught up by the income tax anyway by reducing the exemption, broadening the base. It does not seem quite fair to tax them on their increases. We also have definitely in mind, if this can be accomplished, the entire inflationary results it would produce.

Senator VANDENBERG. I might say I have explored this with the Treasury at some length. They said they throw up their hands in the face of the administrative conundrum that they are confronted with.

Mr. AMORY. You do not think it is practical, Senator?

Senator VANDENBERG. That is it.

Mr. AMORY. I think the idea has merit, though, and it should be studied.

Senator VANDENBERG. It certainly has.

Mr. AMORY. Our association also is strongly in favor of curtailing as much as possible expenditures not connected with the defense program and in eliminating unnecessary waste and extravagance in the defense program itself. A dollar saved is equivalent to a dollar of additional revenue. On the question of nondefense expenditures, Secretary of the Treasury Morgenthau made the following statement in his testimony before the Ways and Means Committee on this bill under date of April 21, 1941:

> It seems to me, using round figures, it is possible to cut the nondefense items to the extent of $1,000,000,000.

It is difficult to understand why such a cut is not made, since it would have the same effect on Federal finances as raising $1,000,000,000 of additional revenue.

In conclusion, we would reiterate that there is great need for certainty in our taxing system and also that we believe it most important to design such a system so that it will fairly distribute the tax burden, be not too oppressive on business, and be not so severe as to remove incentive and the profit motive.

(The exhibit submitted by Mr. Amory in connection with his statement is as follows:)

EXHIBIT I.—*Estimated revenue receipts for first full year of operation of revised tax system*

Kind of tax	Budget estimate for 1942	Added by House bill	Total annual revenue from revised tax system
Income tax on individuals (current)	$1,604,000,000	$829,000,000	$2,433,000,000
Income-and excess-profits taxes on corporations (current)	2,614,000,000	1,322,900,000	3,936,900,000
Income-tax collections for prior years	260,000,000		260,000,000
Declared value excess profits tax	29,000,000		29,000,000
Unjust enrichment tax	2,500,000		2,500,000
Subtotal, income taxes	4,509,500,000	2,151,900,000	6,661,400,000
Estate tax	341,700,000	135,900,000	477,600,000
Gift tax	32,500,000	16,000,000	48,500,000
Capital-stock tax	193,400,000	22,300,000	215,700,000
Subtotal, estate, gift, and capital-stock taxes	567,900,000	174,200,000	742,100,000
Tax on cigarettes	638,000,000		638,000,000
Tax on all other tobacco products	78,630,000		78,630,000
Subtotal, tobacco taxes	716,630,000		716,630,000
Distilled spirits	446,200,000	122,300,000	568,500,000
Wines	14,900,000	5,000,000	19,900,000
Beer, ale, and malt liquors	312,700,000		312,700,000
Miscellaneous liquor taxes	35,700,000		35,700,000
Subtotal, liquor taxes	839,500,000	127,300,000	966,800,000
Stamp taxes (total)	39,980,000	1,000,000	40,980,000
Manufacturers' excise tax on gasoline	389,200,000		389,200,000
Other manufacturers excise taxes imposed by existing law	277,200,000	185,700,000	462,900,000
New manufacturers' excise taxes proposed		200,900,000	200,900,000
Subtotal, manufacturers' excise taxes	666,400,000	386,600,000	1,053,000,000
Admissions tax	74,200,000	60,000,000	134,200,000
Telephone and telegraph messages	29,300,000	26,600,000	55,900,000
Sugar tax	60,100,000		60,100,000
Other miscellaneous taxes (old)	35,325,000	4,500,000	39,825,000
New miscellaneous taxes proposed		274,100,000	274,100,000
Subtotal, miscellaneous taxes	198,925,000	365,200,000	564,125,000
Total employment and old-age benefit taxes	961,300,000		961,300,000
Total, Internal Revenue	8,500,135,000	3,206,200,000	11,706,335,000
Customs	295,000,000		295,000,000
All other miscellaneous receipts	176,600,000		176,600,000
Total receipts, General and Special Accounts	8,971,735,000	3,206,200,000	12,177,935,000
Deduct appropriations for Federal old-age benefits, etc.	696,300,000		696,300,000
Total net receipts, General and Special Accounts	8,275,435,000	3,206,000,000	11,481,635,000

Senator CONNALLY. May I ask if you are in the investment-banking business personally?

Mr. AMORY. Yes.

Senator CONNALLY. You are not representing the Investment Bankers' Association as an attorney?

Mr. AMORY. I happen to be the chairman of the Federal taxation committee of the association for the current year.

Senator CONNALLY. Thank you very much.

Senator BAILEY. Now, you are asking us to decrease the rates of taxes on capital-stock transactions and increase the rates on purchases.

Mr. AMORY. That is what it amounts to.

Senator BAILEY. What is your firm?

Mr. AMORY. Smith, Barney & Co.

Senator BAILEY. You might try to apply that purchase tax to stocks and bonds.

Senator CONNALLY. Yes.

The CHAIRMAN. Any other questions?

Senator CONNALLY. What would you say as to a little transaction tax on the sale of securities?

Mr. AMORY. I don't think you would get any money from it.

Senator BAILEY. Well, there has been a substantial increase in stock sales on the market in New York; I believe they are a million shares over last year.

Mr. AMORY. They are still at a very low level.

Senator BAILEY. Well, 3,500,000 shares----

Mr. AMORY. I think the volume is about one-third of what it was 5 years ago.

Senator BARKLEY. You designated this a "purchase" tax in order to get away from the old word "sales"?

Mr. AMORY. No; we didn't. You will notice we didn't strike out the word "sales"; but the British have referred to it as a purchase tax and that is why I used that term.

Senator BAILEY. Well, there isn't any difference between a purchase and a sales tax, is there?

Mr. AMORY. No; it is simply a matter of wording.

Senator CONNALLY. Seriously, you advocate a purchase tax for the reasons you have given; why shouldn't you tax a man when he buys a bond, too? He buys it because he has some surplus capital. If he purchases some article you want to tax that transaction and yet if he buys a bond and it is an investment, you don't want to tax him. Why is that?

Mr. AMORY. There is a certain amount of risk in buying any kind of security, Senator Connally.

Senator CONNALLY. Yes; there is a hazard, too, in buying automobiles or anything else which you agree should be taxed. If you get out on the road and have a wreck there is some risk in that, too.

Senator BARKLEY. One is physical and the other financial, I suppose.

Senator CONNALLY. Yes; one may kill you, and the other may let you live. Is that it?

(No response.)

The CHAIRMAN. Mr. Willever, do you wish to be heard?

Mr. WILLEVER. Yes.

STATEMENT OF J. C. WILLEVER, FIRST VICE PRESIDENT, THE WESTERN UNION TELEGRAPH CO.

Mr. WILLEVER. Mr. Chairman, my name is J. C. Willever, and I am first vice president of the Western Union Telegraph Co.

I am speaking for the telegraph industry as represented by my company, the Western Union, the Postal Telegraph Co., the Commercial Cable Co., the Mackay Radio Cos., and All-America Cable & Radio, Inc., in urging some modification of the tax proposed to be imposed upon telegraphic communications, domestic and foreign.

All of the companies mentioned are desirous of the closest cooperation with the Government in all matters and particularly in the vital matter of national defense. In common with many other concerns

they have long borne without complaint the very substantial burden of collecting and accounting for the taxes assessed against their product. They recognize the imperative need for large additional sums of money to be raised by taxation, and they have no disposition to shirk their part in the necessary money-raising program.

But they do ask that the added taxes assessed against their product shall not be out of line with the increases in other items, and for this very definite and important reason:

An efficient and dependable domestic telegraph and overseas written communication service is an indispensable adjunct to the national defense and it has been so recognized in the composition of the National Defense Board. Anything which tends to impair the efficiency of these services should be avoided at this particular time.

Both services are dependent on volume for prosperity. Western Union in 1926, with a gross operating revenue of $134,000,000, had a net income of $15,000,000. In 1932, with a gross of $83,000,000, it operated at a deficit of nearly $1,000,000. In 1940, with gross revenue of nearly $100,000,000, it had a net income of $3,600,000.

In other words, in 1940 Western Union out of $100,000,000 revenue made $3,600,000 net while, in 1926, with revenue only one-third greater, it made $15,000,000, or five times as much. Nothing could show more clearly than these figures do the importance of volume in the telegraph industry and the disastrous effect of even a moderate shrinkage in revenue.

The present tax is 5-percent on domestic messages and 10 cents each on cablegrams. The proposed law imposes graduated taxes beginning at 5 cents for messages which cost from 25 to 50 cents and increasing to 25 cents for messages which cost between $2.01 and $2.50, plus 5 cents for each additional 50 cents or fraction thereof. We have applied these increased taxes to taxable traffic originating on July 23 at Atlanta; Boston; Chicago; Cumberland, Md.; Dallas; Denver; Grand Rapids, Mich.; Green Bay, Wis.; Harrisburg, Pa.; Lexington, Ky.; Richmond, Va.; Salt Lake City; San Francisco; Springfield, Mo.; and Tacoma, Wash. These places represent, in general, one large, one medium, and one small-sized place in each of our operating divisions.

The volume embraced in the study represents 14 percent of the total volume throughout the country, thus constituting a reliable sample. We find that the percentage increase in the tax on domestic messages ranges from 134 percent at San Francisco and Tacoma to 168 percent at Lexington. The average increase is 151 percent and it is safe to say that this average will apply to our domestic traffic as a whole. The increase in the case of cablegrams is 346 percent.

A study which has been made shows that the proposed tax as applied to domestic telegrams is equal to 13.1 percent of taxable tolls and on Western Union cablegrams is equal to 10.5 percent of the gross through charges. Actually, as a percentage of the tolls retained by the American companies on overseas messages, the tax amounts to 20 percent in the case of Western Union and in the case of Postal, which participates only as to land-line charges, it is in the neighborhood of 80 percent.

In the case of the radio companies, which customarily split on a 50-50 basis with foreign stations, the tax is in the neighborhood of 20 percent.

It is the considered opinion of the industry that the traffic will not stand so heavy an impost and that if the tax is increased to the extent proposed in this bill there will be a further diversion of traffic to the air mail, which, in addition to being heavily subsidized by the Government, is not subject to any tax.

Notwithstanding the heavily increased traffic in 1940 due to abnormal conditions, Western Union made only $3,600,000. Postal operated at a loss. The cable business, except to South America, is badly shot, due to conditions overseas. None of the other companies which I represent is making a fair return upon its investment, notwithstanding the present temporary bulge in traffic.

Like industries generally, all the companies which I represent are under pressure from their labor for more money. If wages are increased and if as a result of excessive taxation the business does not hold up, necessary retrenchment measures will injuriously affect the service. Some of the companies may be driven to the wall.

As to the effect of excessive taxation on volume, I quote as follows from a letter written by President Chinlund of the Postal Co. to Chairman Doughton of the House committee in reference to this bill. I may say in passing that that letter, like a similar letter written by my chief, unfortunately did not reach the committee until after it had disposed of the bill.

The CHAIRMAN. Were you represented in the House?

Mr. WILLEVER. No; we were not represented there at all.

I am now quoting from the letter:

> In 1937 the Federal Communications Commission, in denying a rate increase to the telegraph companies, stated as one of the reasons for such denial that "we are not satisfied that the anticipated increase in revenues would not be offset by the permanent loss of traffic to lower-cost services of the petitioners and to competing carriers."

It is urgently suggested that the tax on telegrams should be fixed at not more than 10 percent or double the present tax and that the tax on overseas messages should be fixed at 5 percent, which would be double the present tax and would represent around 10 percent on that proportion of the tolls on such messages which accrue to American carriers.

Senator CONNALLY. Why is it suggested that the tax on domestic telegrams be so much more than the tax on overseas messages?

Mr. WILLEVER. That proposal has in mind the fact that the charges of the connecting lines beyond this country sometimes are two or three times that of the American companies.

The CHAIRMAN. All these charges are passed on to the public.

Mr. WILLEVER. Yes.

The CHAIRMAN. But your point is that you reduce your volume of business thereby?

Mr. WILLEVER. That is the point, sir.

Senator VANDENBERG. What is the revenue under your proposal as compared with that of the House?

Mr. WILLEVER. I haven't figured that. It is three-thirteenths of what is anticipated. For all the companies, about $3,000,000, my associate tells me.

Taxes so established would have the merit of progressing proportionately with the cost of communications, while the proposed tax as applied to domestic messages ranges from 20 percent to 10 percent, decreasing percentagewise as the cost of the communication rises.

Such a result cannot possibly have been in contemplation by the persons who drafted the tax measure, and it is strikingly shown on the chart which I exhibit and a copy of which is now before you.

While it has nothing directly to do with the case, it is perhaps not out of place to call the attention of the committee to the fact that the telegraph companies are carrying a heavy burden of contributions to the Government by being paid for a preferential service only about 60 percent of their regular rates.

This burden is increasing rapidly as the volume of telegraphing done by Government agencies expands with increasing activity in defense measures, to say nothing of the heavy telegraphing of private contracting concerns operating under cost-plus contracts which are claiming Government rates on their messages with the support of the Government agencies involved.

What this 60-percent rate means will be better appreciated if it is understood that about 63 cents of each dollar of telegraph revenue is disbursed for wages, social-security taxes, pensions, and other employee benefits. As contrasted with this reduced rate on its telegrams the Government pays the telephone companies 100 percent of their regular rates for telephone service, which is another principal competitor of the telegraph service.

Incidentally, the teletypewriter service of the telephone company, which is a written-message service competitive with the telephone companies', as well as the tax on its leased wires, which is another form of written service, is, under the bill under consideration by your committee, subject to a tax of 5 percent as against the proposed 13.1 percent on the traffic of the telegraph carriers. Obviously the tax, at whatever figure it is fixed, should be the same for all carriers and for all forms of written service in the domestic field. Under the present law this condition exists.

The plight of the telegraph industry and the reason why the volume of its traffic should not be needlessly curtailed by excessive taxation thereon has probably never been better stated than by Chairman Fly of the Federal Communications Commission in his recent testimony before a special subcommittee of the Senate Committee on Interstate Commerce holding hearings under Senate Resolution No. 95, which statement is as follows:

> Competition and other facts have driven the two major telegraph carriers to the point where their very existence is in jeopardy. The national defense, the interests of employees, and other considerations make it undesirable that we should permit either to be forced to the wall * * *.
>
> Here, to sum up, we have a picture of two telegraph companies competing desperately with one another and simultaneously faced with overwhelming competition from the telephone, radio-telegraph, air mail, and Bell System telegraphic services.

In conclusion I draw attention to the fact that except on special occasions such as Christmas, New Year's Day, and so forth, fully 90 percent of all telegrams or cablegrams are of a business nature. The same consideration which prompted omission of a tax on freight shipments because they are so largely made in pursuance of business should supplement the plea of the telegraph carriers that the tax on telegrams and overseas messages shall not be unduly increased lest their traffic be so affected that they will be unable to function in an adequate and satisfactory manner.

The study that I have referred to is reflected in a synopsis attached to this statement. In addition we have brought with us and will leave for the consideration of the committee or Treasury Department the details of the study so that you may be satisfied our computations are correct.

Senator VANDENBERG. How much does it mean to the Government to enjoy this 60-percent preferential rate?

Mr. WILLEVER. What it means depends on the volume. It is very substantial, I know. In the cable field, where it was minor, it has now become major. In the domestic field, where the Government gets 60-percent preferential, the amount involved is very large and runs into the millions of dollars.

Unfortunately, I am not prepared to answer the question exactly.

Senator VANDENBERG. I should think it would be a very good figure for you to present to help your own cause.

Mr. WILLEVER. I will be glad to supply it.

(The information requested is as follows:)

U. S. Government domestic and overseas traffic handled by major telegraph, cable, and radio companies at preferential Government rates, 12 months ended June 30, 1941 (Radio Corporation of America communications for year ended Dec. 31, 1940)

	Domestic traffic including land-line tolls on overseas traffic	Overseas traffic beyond borders of United States	Total
Estimated revenues calculated at commercial rates	$3,695,031	$1,048,892	$4,743,923
Revenues charged for at preferential Government rates (average about 60 percent for domestic messages and 50 percent for overseas messages)	2,271,661	524,446	2,796,107
Estimated amounts saved by the U. S. Government through application of preferential Government rates, which amounts are lost to the record communication companies	1,423,370	524,446	1,947,816

This data represents the aggregate results submitted by the Western Union Telegraph Co.; Postal Telegraph, Inc.; All-America Cables & Radio, Inc.; the Commercial Cable Co.; Mackay Radio & Telegraph Co. (Delaware); Mackay Radio & Telegraph Co. (California); Radio Corporation of America Communications, Inc.; the Commercial Pacific Cable Co.; and the Mexican Telegraph Co. Companies not included are: French Telegraph Cable Co.; Globe Wireless, Ltd.; Northern Telegraph Co.; Press Wireless, Inc.; Radiomarine Corporation of America; Tropical Radio Telegraph Co.; and U. S.-Liberia Radio Corporation, and certain smaller companies whose annual operating revenues do not exceed $50,000.

Senator CONNALLY. What rate does the Government get on commercial business?

Mr. WILLEVER. Fifty percent.

Senator CONNALLY. What salary does the president of Western Union receive?

Mr. WILLEVER. $60,000.

I made a statement awhile ago which was erroneous; I stated that the changes in the bill proposed by us would effect a difference in the amount involved. It is $1,600,000 instead of the larger figure I mentioned.

Senator GUFFEY. How does the tax on telephone transactions compare with that on telegrams?

Mr. WILLEVER. It is the same.

Senator GUFFEY. When does the tax start?

Mr. WILLEVER. Twenty-five cents or twenty-four cents, and runs indefinitely.

Senator GUFFEY. And where does the tax on telephone service start?

Mr. WILLEVER. The same as telegrams, the difference being that the telephone companies are very prosperous and extraordinarily so at the present time and their business can stand a tax that under the present conditions the telegraph companies could not.

Senator CONNALLY. Do you make any money on Government business with foreign countries?

Mr. WILLEVER. I don't think so, but that was an obligation imposed on American carriers by Great Britain when the cables were laid between the United States and Great Britain, and although at that time we were under no obligation to extend the benefit to the American Government we felt we should put the American Government on a most-favored-nation basis and not treat it any different from the Government of Great Britain.

Senator CONNALLY. With this increase in Government business you ought to know whether you are or are not making any money as a result of it.

Mr. WILLEVER. We are losing money on the cable business as a whole; there is no question whatever about that. At the 50-percent rate the Government business is on substantially a parity with the commercial business, which is largely made up of business on the deferred rate, so that the Government business, which is not, is therefore about on an average with the commercial business.

Senator TAFT. Don't you feel that by reason of the reduced rate Government officials use more words?

Mr. WILLEVER. I don't know that that is so; I think they are quite liberal users of the service. I don't know that they pay much attention to the use of words.

Senator VANDENBERG. Government officials always use more words; don't they?

Senator CONNALLY. They don't handle the Senate debates.

The CHAIRMAN. Anything else?

(Mr. Willever submitted the following tables and chart for the record:)

Summary of exhibits showing by offices listed telegraph message charges and present and proposed message tax thereon for traffic dated July 23, 1941

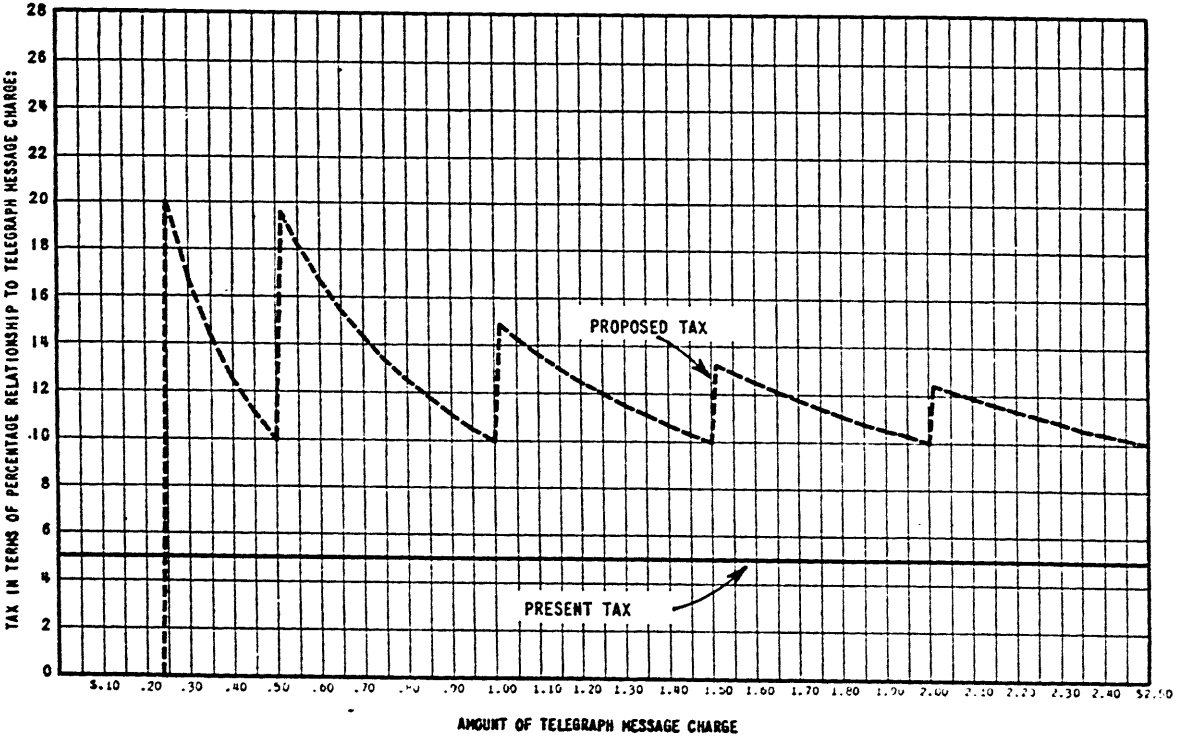
COMPARATIVE CHART SHOWING TELEGRAPH MESSAGE TAX IN TERMS OF PERCENTAGE RELATIONSHIP TO TELEGRAPH MESSAGE CHARGE, UNDER PRESENT AND PROPOSED REVENUE ACTS.



The CHAIRMAN. Mr. Hyman.

STATEMENT OF ARTHUR B. HYMAN, NEW YORK, N. Y.

Mr. HYMAN. I may be alone in my class here. I don't speak for anybody; I represent no one. I come to give the views I have developed out of long experience in the practice of the law and particularly one which has been devoted to practice before the Treasury Department.

I have had a very considerable experience in the matter of taxation and I am not prepared to submit in final form a memorandum which I started the preparation of last week and which I have added to in the last few hours.

I shall try to be as brief as possible. I want to make my position clear at the very outset because the impression might arise that I was in favor of curtailing expenditures for the national defense; nothing of that kind is on my mind.

On the contrary, it would not make a particle of difference to me if the necessity were five times as great; I would still think that necessity ought to be met and that whatever funds had to be raised should be raised to meet the necessity.

But there are several things that enter into that consideration and the first, it seems to me, is that when we started to and signified our willingness and readiness to accept any sacrifices that must be faced in the emergency, we have the right to expect that the cost of the defense program will be borne in the soundest manner and that we won't be called upon to make sacrifices that are not absolutely necessary.

In other words, what I wish to convey is that every consideration be accorded to us who must bear the burden, and I have heard so much from members of this committee as well as from members of the House committee to the effect that we must raise all the money that is possible, but I have not yet heard anyone say that we ought not raise any more than is absolutely necessary.

Now, having that in mind, it seems to me that we have gotten off to a wrong start. When we came to consider financing the cost of this defense program we started with the notion, I believe, that it should be financed in the proportion of two-thirds by taxation and one-third by borrowing.

I suppose that is an arbitrary figure and no one could give us any good reason why so vast a part of the expenditures necessary should be raised by direct taxation.

If, as I am informed, we proceeded on another theory in the World War and financed our expenditures by raising one-third by taxation and two-thirds by borrowing, I cannot see any reason why we should not follow that procedure at this time.

Senator BAILEY. At the start of the World War the Government began owing very little; now it has a debt of $44,000,000,000 or $45,000,000,000.

Mr. HYMAN. I appreciate that, but it still seems to me, as a matter of common logic, that there is a point you must consider in this connection, and that is: How much ought, in good conscience, to be borne at this time and how much spread over a longer period of years and be faced in the future?

In other words, you reach a point where you just cannot take it; the tax burden becomes so heavy you cannot handle it; it bogs down. And in the meantime you have suffered very seriously.

Senator BAILEY. The Secretary of the Treasury fixed the ratio of two-thirds and one-third on the proposition that was necessary to present inflation.

Mr. HYMAN. I wonder if that is a proper approach to the problem. I have never considered that a bill to raise revenue was anything but a bill for that purpose; I do not think it should be punitive or that fears, such as the fear of inflation, should be primarily considered.

Senator CONNALLY. You don't think any economic considerations ought to enter into it?

Mr. HYMAN. Oh, in a remote sense; yes.

Senator CONNALLY. Then, in the interest of the time allotted to you, I suggest you get down to cases and tell us what you want to do.

Mr. HYMAN. All right; I will do that.

When I prepared the memorandum I had no intention of discussing the joint returns. I supposed that anything that appears to me quite so pernicious and indefensible as that, after it had been deleted by the House, would not come up again for consideration by the Senate.

Senator CONNALLY. You are bringing it up; it hasn't been mentioned.

Mr. HYMAN. The Secretary of the Treasury brought it up and said a good deal about it and that is what impelled me to make a memorandum on the subject.

I don't want to take up time unnecessarily, but I do want to advert to the arguments that have been advanced. Senator Barkley brought up one of them; he pointed out that we had been striving for many years to establish the independent status of a man and his wife and such a tax goes contrary to that tradition.

It goes more than that; it violates the idea that an income tax should be levied on the person who received the income, not to be measured by the income received by someone else.

Now, I pass that. He recommended and I have heard recommended here also a reduction in exemptions. It has been my theory that exemptions, general exemptions, personal exemptions, are unsound in themselves. They are a matter of grace, representing a luxury the Government might indulge in when there is no great emergency threatening us and when we are endeavoring to reach tremendous sources of income for Government purposes.

In my opinion the Treasury has not gone far enough, nor the gentleman representing the American bankers, the Investment Bankers Association. My own notion is that exemptions should be entirely abolished; that we cannot afford them; and that such money is a sound way of raising income.

Senator CONNALLY. How much would you tax a person getting $10 a month?

Mr. HYMAN. Oh, I suppose there are cases in the United States where men are earning $10 a month.

Senator CONNALLY. Well, some are not earning anything at all.

Mr. HYMAN. That is right; but they won't pay anything, either. We should start with a minimum of 1 percent. Starting low enough, it is not going to hurt anyone very materially.

For example, take a man earning $1,000 a year.

Senator CONNALLY. We are going to tax him under this bill.

Mr. HYMAN. Yes; after an exemption of $750. I say that exemption is not sound and I say it should be either abolished completely or substantially reduced. There have been two arguments advanced against that, one political and the other economic.

That it would be difficult of collection. I don't think that is a sound argument. We have had experience with withholding the tax at the source and I think we can reach all sources of income by the proper application of that principle.

The CHAIRMAN. Excuse me.

For the benefit of the members present, the leader, Senator Barkley, advises me that he will call the calendar, so that, when we recess, around 12 o'clock, we will come back at 2 o'clock.

All right. Proceed.

Mr. HYMAN. Now, there is another thing which I call luxury under the present circumstances that we are indulging in and which I think ought to be eliminated, and that is the exemption for earned income.

I think that the fundamental difference between earned income and income from other sources is not so important or so great that we should perpetuate it; I think it could be well eliminated and we could wait for happier times to grant such exemption.

Now, no one has taken up the question of excess-profits taxes, assuming, suppose, that the House views will be followed in the Senate.

I have only to say that I think the alternative method of computing excess profits is a very sound one. It eliminates many of the unfortunate experiences we had under the act of 1918 and it will not leave those so unfortunately placed as to be amenable to it to the tender mercies of the collecting authorities.

The CHAIRMAN. Do you agree to the principle of the 10 percent as contained in the House bill?

Mr. HYMAN. I don't know as to that specifically; I was speaking of the fundamental question of taxation.

The CHAIRMAN. Your theory is that this is a sound or at least an advisable method?

Mr. HYMAN. Yes; it is.

The CHAIRMAN. Of course, you have to have some standard.

Mr. HYMAN. Yes; but the alternative method, it seems to me, does pay some attention to what really constitutes excess profits.

Now, another thing which has not been touched upon here: I suppose I am going to be on very controversial ground again when I ask the committee of the Senate to explore again the capital-gains tax. I think there is a source of revenue that we have not nearly begun to explore, and I think the difficulty lies in the fact that we have always taxed them on too high a rate. I have entertained that view and expressed it more times than now. I have written before to the Senate Finance Committee and the House Ways and Means Committee.

I think the capital-gains tax is helping to defeat its own purpose. Just taking a glance at the record of transactions on the New York Stock Exchange, alone, it seems to me, will bear out that notion.

In my opinion, 350,000- and 400,000- and 500,000-share days on the New York Stock Exchange are just as abnormal as 8,000,000-, 9,000,000-, and 10,000,000-share days were in the panic of 1929 and 1930, and transactions in securities are being very much curtailed.

There is no doubt that the high tax rate is a serious deterrent to such transactions.

Senator BAILEY. The same is true, is it not, of transactions in real estate?

Mr. HYMAN. Yes. I use this only as an illustration. Two or three of these types illustrate to me better than anything else the old theory that you can defeat your desired end of raising revenue by putting excessive taxes on the transactions.

I say that there is nothing so conducive to the prosperity of this country, and that means conducive to the raising of additional revenue, as open trading to the utmost possible limits.

Now, if we could get what appears to me, just as a guess, normal trading of about 2,500,000 or 3,000,000 shares on the New York Stock Exchange daily, which many people think would be quite normal, the revenue raised from the capital-gains tax, if it was reduced two-thirds, say, would produce revenue, in my opinion, beyond the wildest dreams of the most optimistic.

Not only is that so but there is a tremendous amount of money being lost in stock-transfer transactions both by the Federal Government and State governments, estimated by the New York taxing authority at $200,000,000 a year. Whether that is extravagant or not I do not know, but I know this:

We haven't a thing in the world to lose by adopting the theory of reducing the tax on capital gains to see if, in 1 year, we do not realize the promises made in that connection.

In my memorandum I suggested the outright repeal of this tax but I know at this time, under the conditions existing, that such is not possible, and I therefore suggested, as a compromise, we try the reduction in the rate of tax on capital gains.

When you have an active market those securities pass from hand to hand so many more times and each time the transaction produces revenue.

Senator BAILEY. Would you make a distinction between a speculative transaction and an investment?

Mr. HYMAN. I would not; there isn't any difference. Every time anyone purchases a security he does it, of course, for purposes of sound income, which involves stability; but there is an actuating motive all the time, which is the profit motive.

He thinks that this is a fine stock and some time that stock is going to be worth, 25, 50, or 100 times more than when he bought it; so the speculative element is there anyway.

Therefore, why say if you buy and sell a stock within 12 months you have engaged in a speculative transaction whereas, if you keep it for 2 or 3 or 5 years, you have not? They should be put on a parity and a flat rate levied upon them.

Now, the next proposal I wish to make is one already adverted to; that is in regard to gift taxes. And almost the same thing might be said as to it that was said of the capital-gains tax.

We presumably levied a gift tax in 1932 for the purpose of deriving revenue from that source; at least, it was so said.

The CHAIRMAN. It was to make the estate tax effective.

Mr. HYMAN. Of course, it was needed as a complement to prevent the avoidance of any estate tax whatever, but they put a three-quarter tax on gifts in relation to the tax on estates for the purpose, so it was said, of realizing revenue by the Government.

Senator BAILEY. With the gift tax abolished and your proposal on the separate-returns question, every man would immediately give one-half of his income to his wife. Now, where would you get your revenue?

Mr. HYMAN. Are you asking me on the basis of adopting or failure to adopt the joint return?

Senator BAILEY. Staying where we are now, when a man has an income of $75,000 and you have abolished the gift tax——

Mr. HYMAN. Oh, no.

Senator BAILEY. You do not propose to abolish the gift tax?

Mr. HYMAN. No; I want to maintain it. But what I do say is the gift-tax revenue has bogged down. And why has it? Because it is almost impossible for a man to make a taxable gift today without he makes a complete delivery and divests himself of every incident of ownership.

Now, if you want to have the revenue from gifts, why do we not put a lower rate than presently maintained and why don't we tax every kind of gift whether in trust, revocable, or irrevocable, or any other kind?

And if, in one instance that I visualize, the trust is so drawn that the corpus finds its way back into the hands of the settler, make provision that upon his death proper credit may then be given.

I wouldn't think it was a serious matter even if you kept the rate; I only believe a lower rate will increase the revenue.

At any rate, the object I am after is—and if you just read the gift-tax statute and the estate-tax statute, supposed to be complementary of course, you will find, whereas you intended to encourage gifts, you have made it practically impossible to have them; you will find the wealth of litigation which has developed from them.

The Supreme Court, the circuit court, and the Board of Tax Appeals are busy day after day trying to solve the problems created by penny chasing, and that is what I call the habit of the Department; penny chasing; always worried lest somebody escape with $10 that he might have paid for a gift tax.

You will find that; and I could demonstrate it to you in scores of ways. There has been this constant rush to the House and Senate for amendments because some individual was ingenious enough to get away with a little tax.

I say if you will broaden out the gift tax and make it apply to all transactions you will encourage gifts. By so doing you will derive the revenue which you are not getting now. And I tell you that many people would welcome an opportunity to put their houses in order instead of facing the chaos which they know will be present at the time of their death.

Now, some years ago I suggested that the most effective method of taxation, in my opinion, would be based upon income and sales. This gentleman called it a purchasing tax, a distinction, I think, without very much difference. But the point of the matter is that if we had those two basic methods of raising revenue I think we would be in a position where we could go on without constant revision and constant upping of tax rates, constant unsettlement which business suffers from this sort of thing; we would establish a stable system of taxation based, on the one hand, on income, and, on the other, on sales.

Now, there may be lots of arguments made against it, partly economic and partly political, but it seems to me that a very low rate of tax applied to sales would produce a tremendous amount of revenue without upsetting our system or shocking it in the slightest degree.

Sometimes it is said if we are going to tax on the ability to pay that is not one of the forms we should adopt. Not, that is not true because we overcome any objections of that kind by a graduating of the scale. Therefore those two systems, if worked together, would be effective as compensating each other.

If our incomes were down and thus revenue from that source were lowered, it would be upped from the sales side; whereas, when we are prosperous and revenue from income or other form of taxation is sufficient, the rate on sales could be lowered.

In other words, the two seem to me to be natural avenues of revenue.

Senator BAILEY. You would put that tax on food and clothing?

Mr. HYMAN. No; I would exempt food. I would want to give consideration to clothing. But food, medicines, and those things that are absolutely necessary, I think, should be exempt.

After all, we are paying a terrific sales tax already and the poor are getting it as well as the rich every time they buy anything in the long list of things that are subject to excise taxes, which are sales taxes under another name.

Senator BAILEY. The sales-tax revenue now is something better than $2,000,000,000.

Mr. HYMAN. Yes; and it could be made much greater, and it would be easy to collect; and that is certainly one objective to be sought. Then, furthermore, I think one of the members of the Ways and Means Committee remarked that you were coming to it anyway, probably next year, when further revenue would be necessary; and, if that is so, I don't see any reason why we should postpone that day. If it is to come eventually, why not now? In my opinion, it should have come many years ago.

I think I have covered the major things that I wanted to present. If I may have the privilege, I would like to complete the memorandum and submit it.

The CHAIRMAN. You may do that.

(The memorandum submitted by Mr. Hyman is as follows:)

MEMORANDUM ON PROPOSED REVENUE ACT OF 1941

By ARTHUR B. HYMAN

To the Finance Committee of the United States Senate:

We approach the consideration of a new tax bill again under the pressure of an emergency. Hasty and ill-advised legislation might reasonably be expected under such circumstances, but since emergency legislation has come to be the rule rather than the exception, we should by this time have acquired the virtue of being able to give calm and considered judgment to this subject.

At the outset, I wish to make my position clear. We are engaged in an all-out program of national defense. Whatever price we have to pay is not too great, but when called upon to make the sacrifices that are necessary (and they will be very great), the people are entitled to have their representatives approach this subject not, as seems to be the case, with the idea of raising all the money that is possible, but, rather, with a fixed determination to raise no more than is absolutely necessary, and even that in a manner that will least affect their well-being.

It is almost a truism to say that the most desirable method of raising revenue is that which occasions the least shock to the economic system. There was a time when Congress considered that objective to be paramount. Under the

pressure of constant emergencies, however, it has apparently been relegated to the background, although lip service is paid to the concept (Ways and Means Committee Report, p. 3).

The Ways and Means Committee expresses the hope that the immense burden of the new levies will be met cheerfully by the American people, and that the people realize that the risk to life and property from inadequate preparedness would make a much heavier burden attractive by comparison.

The latter of these observations is fully justified, and there is no doubt that the American people will accept whatever burdens may be properly imposed upon them for the purpose of financing the program. They have the right to demand, however, that the burden be properly distributed, that is to say, that a fair proportion of the cost be raised by taxation and a fair proportion by borrowing.

Expenditures for defense have reached astronomical figures. Their necessity is not questioned. In a program of such magnitude, however, it is obviously impossible to raise the sums required by any reasonable method of taxation. The question, therefore, immediately arises: How much of the burden can be carried by taxation without oppression, or, perhaps, how much of it can be carried by taxation without injury to the economic system?

Prior to our embarkation upon the defense program, expansion of governmental activities had tremendously increased the burden of taxation imposed upon the people. Their willingness to meet these new exactions was inspired by a thorough realization of their necessity. This spirit should not be imposed upon, nor will it endure in the face of a realization that they have been saddled with an unnecessary burden or one greater than they should be called upon to bear.

The Revenue Acts of 1940 made the prior impositions pale into comparative insignificance. It is now proposed to further increase this burden by raising, through taxation, an additional 3½ billions of dollars. If this is necessary, the people will bear it cheerfully. But the Congress must not mistake their attitude or suppose that they will permit themselves to be oppressed or exploited. There is no convincing evidence of the need for raising the additional sum sought by the administration. It is a matter of great concern that Congress has reached so complacent a state of mind in regard to expenditures that unlimited sums are made available upon the mere request of the administration. Something is obviously wrong with the picture.

In 1939, President Roosevelt declared in his Budget message to Congress that Treasury figures, based upon the proposals then before the Congress, indicated that if the Nation's income reached $90,000,000,000, the yield would be $10,600,000,000.

Since that time, approximately 1½ billions have been added under the Revenue Act of 1940. The Treasury estimates that the national income will reach $90,000,000,000 this year. On that basis, the yield will be only a few hundred millions less than the amount which the Treasury estimates require. Why, then, should the Congress impose upon the people's patriotism by adding further to burdens already becoming too onerous? It would be a national calamity to destroy the confidence of the people that their representatives will at all times zealously guard them against profligacy and call upon them for sacrifices only when the need for such sacrifices arises.

A further and most important consideration also enters into the situation. In the report of the Ways and Means Committee, it is pointed out that the expenditures in the World War were financed one-third by taxation and two-thirds by borrowing. The defense program is not for the benefit of this generation alone. There is no sound reason why it should bear a disproportionate part of the expense of it. If the financing of the World War was accomplished by taxation and borrowing in the proportions of one-third and two-thirds, respectively, why, in the face of the heavy burden already imposed by the act of 1940, should those proportions be practically reversed in connection with a program far more extensive and for more enduring?

Justification is sought for this in the fact that our national debt at the beginning of the World War was unimportant in contrast to that which now exists. That is a factor that must be taken into consideration, but it falls very short of adequacy to justify the imposition of so great a burden of taxation upon the present generation of taxpayers. There is obviously a limit beyond which taxation cannot go without actual oppression. The cost of our defense program must be spread over a sufficient period of years so that its economic impact will not be destructive.

It has often been said that excessive rates of taxation defeat their own purpose. I think we shall presently find this to be true, for, in the aggregate, there will be a

tremendous reduction in incomes subject to the tax, and this will be the result of the operation of the law itself. Recent reports of corporations will serve to throw considerable light upon this subject. Some of them show taxation per share many times the amount paid out to stockholders, or even available for such purpose; and, already, impelled by sound financial considerations, corporations have begun to cut and to suspend action on their dividends. This practice will undoubtedly grow, for the policy of the Government seems to be to curtail profits and, at the same time, to take as large a share as possible of those which corporate taxpayers are permitted to earn. Individual incomes from this source will steadily decrease and, as a consequence, the national revenue from this source will suffer curtailment.

The reluctance to accept the theory that excessive rates of taxation result in diminishing returns has persisted in political circles despite its demonstrated soundness. This attitude has, beyond doubt, retarded our recovery. If our efforts had been devoted to increasing the national income, the needs of the Government could be readily met without taking an unconscionable part of it.

Business and industry feed upon the constant flow of capital. Investment and reinvestment are their lifeblood. The withdrawal, through taxation, of vast sums of capital which would otherwise be plowed back into business and industry cannot but retard recovery and expansion. It may seem rather extraordinary to speak of recovery in the face of income figures that are being released from time to time. Nevertheless, it is clear that we have not recovered from the economic depression, and while the aggregate of income in the United States is steadily mounting, it is mainly due to the defense program, and it is restricted and limited; accumulated capital is still in hiding, and there is little incentive for its reemployment.

If these considerations do not lead to the conclusion that it would be sounder policy to raise by borrowing the sums required beyond those which will be received under the Revenue Acts of 1940, maintaining a ratio of raising, let us say, 40 percent of requirements by taxation and the balance by borrowing, attention should be turned to other means of increasing the revenue by taxation.

I had not intended to discuss the subject of joint returns. I had thought that the proposal was so pernicious and indefensible that the action of the House would relegate it to the limbo of forgotten things. However, the Secretary of the Treasury has brought it to the fore again. His arguments in support of it are utterly illogical. In the first place, he attempts to justify it by the suggestion that it would raise a very large sum. That argument might be advanced to support any tax, no matter how heinous. It seems not to matter to him that it completely violates the conception of separate estates of husband and wife for which we have been striving for generations, nor that it violates the American concept of laying imposts only on the income of him who receives it. When Senator Barkley called the attention of the Secretary to our long history of endeavor to create an independent status for married women, the Secretary answered that many had taken advantage of that attitude.

Upon what theory may a husband be condemned for establishing a separate estate for his wife, an objective heretofore thought to be desirable? None suggests itself.

The Secretary's argument, in detail, will not stand analysis. For example, it takes no account of the time when such separate estate was established, nor of the possibility that it existed prior to the creation of the marital status, nor, again, of the fact that, if established by the husband, it may have had no value, or only a nominal one, at the time of its creation and have developed value subsequently, and, finally, that if more recently established, very large imposts have been levied upon him for the privilege. The Secretary has not suggested even that these taxes be returned.

The fact emphasized heavily by the Secretary—that in several community States, the husband's earnings are, by law, equally divided between husband and wife, thus bringing about preferential treatment in contrast to that accorded residents of other States—hardly justifies the further maltreatment of the less fortunate. If the good fortune of those living in community States is deplorable from the Federal tax standpoint, why not endeavor to remedy that situation by a provision which ignores that status created by State statutes in regard to the earnings of a spouse. That, perhaps, would be too simple, and that it is not the Secretary's true objective is quite obvious.

If the argument is made that such a provision is of doubtful constitutionality, the same may be said with equal force of the joint-return proposal.

ELIMINATION OF EXEMPTIONS

Considerable argument has taken place concerning the advisability of reducing exemptions and thus broadening the base of ordinary income taxation. Exemption from taxation is unsound in principle. Every person enjoying the benefit and protection of his Government should contribute to the expense of its maintenance. While individual contributions from this source may be small, in the aggregate they would be substantial.

The opposition to the proposal is twofold. One is political, the other economic. The former is entitled to no consideration. A political approach to a purely economic conception is indefensible, and as long as it persists we cannot have a sound fiscal system. On the economic side, it is asserted that the cost of collection is prohibitive. That argument does not appear to be tenable, and until reliable statistics are furnished to support it, we should proceed on the contrary assumption. We have already adopted the principle of withholding at the source. That system seems to have worked well enough in practice. If exemptions are entirely abolished and a low rate of tax is applied, collection can be assured by a provision requiring the withholding of the tax on that income at the source. A $10 impost upon a $1,000 salary works no hardship, and there is no reason to believe that the recipient of such an income is less willing to share the expense of his Government than those in the higher brackets. And it perpetuates a principle which seems to be salutary, that is, equitable distribution of the cost of government among all recipients of income, the enjoyment of which is made possible by the Government.

It is proposed to reduce exemptions from $800 to $750 for single men, and from $2,000 to $1,500 for married ones. This, it seems to me, is a rather feeble gesture in the right direction. If taxation upon incomes is a thoroughly sound method of raising revenue, which one no longer doubts, why do we hesitate to apply it completely. Why seek other and more controversial methods when a thoroughly acceptable one is at hand? The abolition of exemptions for both single and married men will bring in a very large amount of revenue. The reduction proposed will accomplish nothing of comparative value.

Another exemption calls for reconsideration in the present emergency. It is the earned-income exemption. It is a luxury which, perhaps, we cannot now afford and which we ought to forego. The distinction between earned and unearned income is not so fundamental that it needs to be perpetuated. In happier times it may be restored.

REPEAL OF THE CAPITAL-GAINS TAX

There is another source of revenue which has not been fully or properly exploited; namely, income derived from the sale of capital assets. The capital-gains tax has been the subject of controversy ever since its enactment. Its proponents urge that the profit derived from the sale of capital assets has no just claim to exemption from taxation imposed upon other forms of income. The fundamental differences between income derived from labor or capital and that derived from the sale of capital assets have been discussed frequently and exhaustively. They are recognized in the complicated provisions of every act passed since that of 1921, where the subject was first dealt with.

There is very persuasive evidence that the taxation of profits from such sales was not originally contemplated under the sixteenth amendment. For a long period of years it has constituted a part of our system of raising revenue, but it still remains to be determined whether its continuance as a part of that system is justified and, if so, whether it cannot be made to produce revenues far in excess of those which are currently being realized.

Year after year repeal or modification of the capital-gains tax has been urged by eminent authority. All arguments in support of its repeal have fallen on deaf ears. In the present emergency, any effort to procure a repeal of the capital-gains tax appears to be foredoomed to failure regardless of the merits of such a proposal.

That such taxation is not economically sound, has been amply demonstrated. Nothing is more conducive toward prosperity than the encouragement of free trading. Whatever tends to limit or retard such trading puts the brakes on business in the broadest sense of the term. It checks individual activity, reduces employment, curtails the circulation of money, and shuts off the flow of capital into productive enterprise. There is no doubt that the panic of 1929 resulted in no small measure from the high taxes imposed upon profits derived from the sale of securities. The natural reluctance to realize such profits created by the heavy impost thereon resulted in a curtailment of supply which otherwise would have been available to meet demand. An inexorable economic law forced prices to heights which had no regard for actual valuations, and this continued until the

whole structure toppled over like a house of cards and brought disaster to the entire country.

As a producer of revenue, this form of taxation has been a complete and ghastly failure. In years of great business activity, substantial sums may be collected. They will be given back, however, in subsequent periods when the trend has been reversed. While, as pointed out before, there is great reluctance to sell in a period of rising prices on account of the punitive taxation, there is no such reluctance when it becomes desirable and possible to take losses. Any method of taxation which is so undependable as a source of revenue is manifestly unsound. Its instability as a revenue producer seriously affects the orderly administration of governmental affairs and creates a situation that should be avoided at all costs.

The repeal of the provisions of the law dealing with the subject would not cause a loss of revenue to the Government. Its repeal would so accelerate trading in securities that the revenue to be derived in the form of stock-transfer taxes would far exceed the annual revenue realized through its continuance. The New York State taxing authorities estimate that the capital-gains tax has caused a loss of revenue in excess of $200,000,000 per annum. Here, again, the reluctance of the Congress to take action appears to be political, resting upon its fear that a repeal or a drastic modification of the capital-gains tax will create the impression among their constituents that they are favoring the so-called Wall Street element. The tax, of course, bears upon all who have possessions. Indeed, it probably affects those in the middle class to a greater extent than any others, and it may well be doubted that its repeal will evoke any criticism. The arguments which have been advanced from time to time against this form of taxation are now fairly well known throughout the country, and if the results of repeal accord with promise, such action will bring unstinted approval.

MODIFICATION OF THE CAPITAL-GAINS TAX

In spite of the views of many well-informed persons that the revenue would be increased by the repeal of the capital-gains tax, it is not to be expected that in the present emergency efforts in this direction, which have failed in less parlous times, can succeed now. Since this is so, and since we are faced with the desirability of increasing the revenue with as little economic dislocation as possible and with the greatest possible advantage, we suggest that transactions involving the sale of capital assets be treated separately; that the net profits realized from such transactions be taxed at a rate low enough to encourage, rather than restrain them, and that where losses exceed gains the rate be applied to the excess and allowed as a deduction against the tax on ordinary income.

The record of dealings on the New York Stock Exchange speaks eloquently of the curtailment in security trading which has taken place in the last few years. Not all of this, of course, is due to the capital-gains tax, but that the tax has played a great part in reducing such activities to their present level, is generally asserted. Three-and-four-hundred-thousand-share days are as abnormally low in this country today as the eight-to-ten-million-share days were abnormally high during the panic of 1929. If a flat rate of 5 percent were applied, it is obvious what the normal share day would do in augmenting the revenue from this source and from the increase which would be derived from stock-transfer taxes.

The present revenue act continues the system of taxing capital gains upon the basis of the length of time during which the assets involved are held by the taxpayer. The implication inherent in this is that profits earned in capital transactions during the first 13 months are speculative. This has no basis in fact. The difference between speculation and investment cannot be determined by any such standard. Every investment, in fact, every transaction entered into for profit, is more or less speculative in character. One invests in sound securities not for the purpose of holding them indefinitely, and not alone for stability of income. Inherent in the act of purchase is the hope also of enhancement. If a substantial enhancement should take place within the year of purchase, sound judgment may dictate the advisability of realizing the profit, but that profit is no more to be placed in the speculative category than if it had been taken in the second, third, or tenth year. A low, flat rate of tax, applied to all capital transactions, is sounder and simpler and takes away the incentive to delay the taking of gains and the stimulation to realize losses. It encourages trade and consequently increases revenue. It has been contended that there is no justification for a lower tax on a speculator than on an individual receiving like income from salary or

business. The hazard in the one case makes the distinction and justifies the lower rate. One who renders services has a reasonable certainty of compensation; one who invests capital in speculative transactions runs a serious risk not only of making no profit, but of losing one's investment.

No one will gainsay that the present method of taxing capital gains has not been satisfactory. If there be doubt that the proposal made herein will produce the asserted results, there is still no reason why we should not try the experiment for at least 1 year. We are certain that there will be no loss in revenue resulting from the adoption of the proposal. There is every reason to hope for a gain that may reach proportions beyond the most optimistic expectations.

GIFT TAXES

The search for additional revenue will be rewarded by a revision of the provisions of the present revenue act imposing estate and gift taxes.

In 1932 Congress imposed upon property passing by gift taxes at the rate of approximately three-quarters of those imposed upon property passing by death. These taxes were levied, of course, for the purpose of increasing revenue, and the differential was established, or so it was said, for the purpose of encouraging the making of gifts.

The preaching and the practice are at variance. It is almost impossible to incur gift-tax liability except by an outright transfer and delivery of property to the donee. The statement is made in this form for the purpose of emphasis.

The changes in the law made at the suggestion of the Treasury Department and their attitude in regard to these two methods of raising revenue emphasize the criticism made at the outset of this memorandum.

The imposing provisions of title III of the act of 1932 are as follows:

"(a) For the calendar year 1932 and each calendar year thereafter, a tax * * * shall be imposed upon the transfer during such calendar year by any individual, resident or nonresident, of property by gift.

"(b) The tax shall apply whether the transfer is in trust or otherwise, whether the gift is direct or indirect, and whether the property is real or personal, tangible or intangible * * *.

"(c) The tax shall not apply to a transfer of property in trust where the power to revest in the donor title to such property is vested in the donor, either alone or in conjunction with any person not having a substantial adverse interest in the disposition of such property or income therefrom * * *."

Under section 302 of the estate-tax law, there must be included in the gross estate of every decedent:

"(c) Any interest of which the decedent has at any time made a transfer, by trust or otherwise, under which he has retained for his life or for any period not ascertainable without reference to his death, or for any period which does not in fact end before his death, (1) the possession or enjoyment of, or the right to the income from, the property, or (2) the right, either alone or in conjunction with any person, to designate the persons who shall possess or enjoy the property or the income therefrom.

"(d) Any interest of which the decedent has at any time made a transfer, in trust or otherwise, where the enjoyment thereof was subject at the date of his death to any change through the exercise of a power by the decedent alone or by the decedent in conjunction with any other person (without regard to when or from what source the decedent acquired such power), to alter, amend, revoke, or terminate, or where any such power is relinquished in contemplation of decedent's death."

These provisions of the Gift Tax Act and the Estate Tax Act show clearly the inconsistency between the avowed purpose of encouraging the making of gifts, with the consequent enhancement of current revenues, and the evident purpose of subjecting almost every gift that one can make to estate taxation.

This inconsistency is emphasized by the provision authorizing a credit for a portion of the gift taxes paid if it should happen that the Commissioner of Internal Revenue subsequently decides that the money which he has taken for gift taxes was erroneously collected. It is idle to pretend that this credit was for the benefit of the taxpayer. Its purpose was to relieve the Commissioner from the responsibility of determining whether the transfer came under the gift tax provisions or estate-tax provisions of the act, notwithstanding the statement of the Supreme Court in *Burnet* v. *Guggenheimer* that a choice must be made as to whether the gift shall be taxed at the time of the creation of the trust or at the death of the settlor.

If the impost on gifts inter vivos was designed to raise revenue, it is difficult to understand why Congress has permitted that design to be frustrated. The Treasury Department seems to be entirely unsympathetic to the Congressional will. This has been amply demonstrated on many occasions, and is illustrated by what has happened in relation to the two forms of taxation now under discussion. The agility with which the Treasury has placed itself upon opposite sides of the same question and the avidity which it has displayed in seeking judgments which it must afterward regret are truly remarkable. The incentive to the making of gifts established by the differential has been completely destroyed.

There should be a reversion to the purpose of the Gift Tax Act. The act should not be encumbered with a mass of fine distinctions and restrictions. Every transfer in trust or otherwise should be subjected to the tax, and further encouragement should be offered by reducing the rate of taxation on such gifts. Provision can readily be made for those cases of transfers in trust in which the corpus finds its way back to the donor or to the settlor and is in his hands at the time of death. In such cases, the corpus should be subjected to estate taxes and credit given for the full amount of the gift tax paid.

How substantial the increase in revenue to the Government would be, it is impossible to estimate, but there is little doubt that many would welcome this opportunity of setting their affairs in order during their lives, rather than to have those who come after them face the chaos that has become all too frequent in the administration of substantial estates. The adoption of these suggestions would also be in the interest of simplification in a field in which litigation has assumed enormous proportions.

Of course, if the Government persists in the policy of having its cake and eating it too, these proposals will have no appeal. If the need for revenue is as great as we are led to believe, and it is desirable to raise it in the least oppressive manner, these suggestions embody one of the ways of accomplishment.

INCOME AND SALES TAXES

Some years ago, we suggested the adoption of a fundamental system of taxation based upon income and sales. Working in combination, these two methods could probably be counted upon under all circumstances to raise whatever sums might be needed to finance the operations of the Federal Government. Having the two primary methods of raising revenue, both of them reasonably flexible, would enable us to dispense with many other imposts. In the years in which the yield from income taxes is high, the rate of tax on sales could be low. The rate of tax on sales could be increased in the years in which the yield from income taxes is unsatisfactory.

Much can be said, of course, in opposition to this suggestion, and we are not unmindful of the objections. It will be said, for example, that in years when the yield from income taxes is unsatisfactory, it will not be feasible to raise the rate of taxation on sales. If the sales tax is made comprehensive, a very low rate will produce a very large return, so that it will never become necessary to raise it to a point where it can become oppressive.

In any event, the matter of raising revenue is simplified by using income and sales taxes as basic and complementary, and we believe they constitute the most reliable means of raising revenue.

Here again, political considerations appear upon the stage. It is continually asserted that sales taxes impose an inequitable burden upon those in the lower-income brackets. As a matter of fact, while they are being persuaded to the contrary, those in the lower-income brackets are being very heavily taxed as a result of the multitude of imposts already laid. We think a sales tax would lighten their burden, rather than increase it, and they would have the satisfaction of knowing what they were paying. While the aggregate of such taxes would be tremendous, individual contributions would not be great. On the other hand, if it be argued that the obligation to contribute toward the cost of Government should be based upon ability to pay, that claim is satisfied by the graduated levies of the income tax.

Experience has demonstrated that sales taxes are easily collected. The resulting flow of funds into the Treasury would be constant. Complications are present, but they present no difficulty comparable with those experienced in the development of income and excess-profits taxation. The assumption that the imposition of a general sales tax would meet with resistance does not appear to be valid in the light of the acceptance by the people of excise taxes on the innumerable items which have been subjected to it. No pretense can be made that this tax is not paid by

those in the lower brackets as well as by those in the middle and upper ones. Poor and rich alike are contributing vast sums in the form of excise taxes which are sales taxes under a different title. Why maintain the deception?

In the last analysis, the common sense of the American people can be counted upon to appreciate and approve any system of taxation which is simple in operation and not discriminatory or oppressive.

In discussing the subject of taxation, one of the members of the House Ways and Means Committee recently predicted that next year we would be faced with the necessity of resorting to this form of taxation. We were very close to its adoption not so long ago, and, in our opinion, its acceptance by Congress was prevented only by an intense campaign waged against it. We do not believe an attempt to muster such opposition would, under present circumstances, be successful.

We believe that the soundness of this form of raising revenue is becoming more and more appreciated. If that is so, there is every reason for action upon it now. The need for speed in the enactment of a new tax bill is not so great as to justify the exclusion from consideration of the proposal for a general levy on sales.

The Secretary of the Treasury urges the Senate to adopt a proposal, defeated in the House, for limiting the computation of the excess profits tax by consideration of invested capital only. The unfairness of this has been thoroughly exposed. Here, again, the motive seems to be to get revenue without regard to equity. That is not an appealing consideration. It will expose us again to the experience under the 1918 act and leave those unfortunately placed in the matter of invested capital to the tender mercies of the collecting authority. That is not a consummation to be wished. The alternative method, now a part of the law, has regard to the true meaning of excess profits and should be retained.

In conclusion, we contend that the necessity for raising additional revenue by taxation has not been demonstrated and does not appear to exist; that if the contrary conclusion is reached by Congress, such additional money be raised by other means than an increase in income or profits taxes and by resort, among other things, to elimination of exemptions from income taxation, including that for earned income; by a repeal or reduction of the tax on capital gains; by changes in the estate and gift taxes and by the imposition of a general sales tax.

In passing, let us say that the habit of spending money is easy to acquire. This applies with particular force when other people's money is involved, and especially so when it comes from the pockets of 130,000,000 people. We are engaged in an all-out effort to safeguard our security and our way of life. No price is too great to pay for it. In the course of our efforts, there will be some waste and extravagance, but we should not permit ourselves to be carried off our feet by wild, and perhaps irresponsible, estimates of the cost of our program. The time has come for Congress to scrutinize the demands of the Government with the utmost care and also to have in mind that there is a limit to what can be taken from the national income without destroying that income itself.

A final word will not be amiss. The obligations imposed upon the people have their origin in a welter of words, the meaning of which eludes even the expert in such matters. The difficulty of ascertaining one's responsibilities under them is little less burdensome than the obligations themselves. No greater service could be rendered to the people than the complete review and revision of our method of raising revenue. Even an expert approaches the solution of problems presented to him by taxpayers with a feeling of futility and resentment at his inability to answer with reasonable assurance the questions presented to him from time to time. A tax law so complicated is an abomination which ought not to be tolerated for a moment longer than is absolutely necessary.

Respectfully submitted,

ARTHUR B. HYMAN.

AUGUST 8, 1941.

(At 12:05 p. m. the committee recessed until 2 p.m.)

AFTERNOON SESSION

(Pursuant to adjournment, the committee resumed the hearing at 2 p. m.)

The CHAIRMAN. Is Mr. R. J. Price here?

STATEMENT OF R. J. PRICE, BOSTON, MASS.

The CHAIRMAN. Mr. Price, give you name to the reporter.

Mr. PRICE. R. J. Price, Boston, Mass.

The CHAIRMAN. You may proceed.

Mr. PRICE. I have not prepared a formal brief to submit to the committee. I have merely come down to speak a few words on behalf of some of the smaller taxpayers who are going to bear quite a burden this year. I am the head of my own accounting firm, and in the past couple of years we have had increasing numbers of small taxpayers come to us for advice and counsel on tax problems. Consequently, we have gotten quite an insight into their reactions to the proposed measures and just how the tax bill might affect their personal welfare.

In one sense, I am a reporter in that we have found that the Congress is in a rather unique position this year. The people want to pay taxes.

The CHAIRMAN. I am not so sure they want to pay as much as some people have said in the past.

Mr. PRICE. That may be.

The CHAIRMAN. I think they want to pay reasonable taxes.

Mr. PRICE. They want to pay their equitable share.

The CHAIRMAN. They want to pay what they are able to pay. I am inclined to think that a good many of them would say that they are not going to be able to pay except what is in the bill at least.

Senator VANDENBERG. They do not want to pay any tax except this particular one.

Mr. PRICE. I thought I would mention that, because I know we have had quite a bit of talk about ability to pay or wanting to pay in a big way. Some of us are inclined to discount it. There is so much newspaper talk about it. We do know most of them feel that they should bear an equitable proportion of the national-defense expenses.

Senator VANDENBERG. They are going to get their wish.

Mr. PRICE. Yes; I think they will, Senator. In that connection, I might say I will speak briefly on the mandatory joint return, on broadening the tax base, and the excise taxes.

The CHAIRMAN. Are you in favor of the mandatory joint return?

Mr. PRICE. I am not, Mr. Chairman. My reason for that is that I believe it is inequitable. I believe it jeopardizes the right of the individual. I believe our whole constitutional concepts are based on the superiority of the individual; that an individual cannot be arbitrarily merged with another individual, and that he, as an individual, has every right before the law, and where you arbitrarily merge them, as this proposal tends to do, you are jeopardizing the right of either the husband or the wife as an individual, you are making each one as an individual paying a higher proportion of taxes on his or her own individual income than someone else who is making a similar amount of money. I think that that is a rather tricky proposal. I spent quite a bit of time going through the reasoning of the House Ways and Means Committee on it, and I have broken it down, I have taken it step by step as we found they set it forth.

First, they say that "each spouse," I am quoting here, "is required to pay a tax only upon his or her separate income." That is all right to there. The intent here is to treat the husband and wife as

separate taxpayers and as individuals. Now they go on and say that there is no imposition of liability upon one person for the taxes payable by another.

I assume here they mean simply each spouse will be held liable only for the tax liability accruing to each individual income.

Now they wind up and say that there is only an increase of tax upon the individual income of each spouse. The only conclusion you can draw there is that they are not going to treat individuals like, after all. We are going to impose a higher rate on some individuals than others, even though, as individuals they are earning the same amount of money. It is almost the same as saying that one plus one if married, equals one, and one plus one, if not married, equals two. It is probably justified psychologically, that one plus one equals one if married, but practically it is not so. I think you cannot abridge the rights of the individuals, just because they have entered into some contractual legal partnership.

Senator VANDENBERG. How often does it happen that all of the income belongs to one spouse and they just split it for the sake of evading the tax?

Mr. PRICE. I would not say that they were seeking to evade the tax, Senator.

Senator VANDENBERG. Do you think it is all right, if the income all belongs to one spouse, to divide it?

Mr. PRICE. To divide it between the two?

Senator VANDENBERG. Yes; to divide it for tax purposes.

Mr. PRICE. No; I do not. If one earns it he should pay on what he earns, but if both earn it, they should pay a rate on what each earns. I do not say that you can merge the individuals into one. You have set up a family unit, they have set up a concept of the ability to pay as a family unit. I think you are confusing the family with the individual. Under that I cannot see where you cannot include everyone in the family, if you had several children in the family, I cannot see why you could not add them altogether.

Senator VANDENBERG. In your experience as tax consultant, do you find it is used for the purpose of tax evasion?

Mr. PRICE. I will have to admit in some cases that is true, particularly with reference to partnerships.

Senator VANDENBERG. Could we close up the loopholes?

Mr. PRICE. The only way I could see that you could close a loophole on a partnership—I do not know whether you could do it by legislation, I think it is a matter of the tax boards and the courts using a little better judgment in determining whether a partnership between a man and wife is evading the spirit of the law, because they can, technically, of course, appear to be within the law and very often actually evading the spirit of it. I should think the court would have jurisdiction there to determine whether they evade the spirit of the law or not. I think, in many instances, they do.

Senator GUFFEY. Mr. Price, have you analyzed the tables on pages 15 and 16 of the report of the Ways and Means Committee by Mr. Doughton?

Mr. PRICE. Is that the one, Senator, where he mentions the number in 1938 who filed jointly?

Senator GUFFEY. Yes.

Mr. PRICE. Yes, I did.

Senator GUFFEY. What conclusion did you draw from them?

Mr. PRICE. I drew this conclusion, that back in 1938 we had a much lower tax rate, and there probably would not be much of an advantage to anyone to file separately then, and furthermore, I think in many instances, the small individual taxpayer did not know whether he ought to file jointly or singly, so he filed whichever way popped in his mind that he thought was the easiest.

Senator GUFFEY. Do you think the 2,866,000 married couples in the United States who filed jointly did not know what they were doing and 175,000 who filed separately did know what they were doing?

Mr. PRICE. I do not go so far as to say that. Did you say the larger number filed jointly?

Senator GUFFEY. Yes; 2,866,000, something like that.

Mr. PRICE. All right. I think, in most instances, it was a matter of convenience and not a matter of seeking to lower the taxes, because I think you will find that the greater number of taxpayers are in the low-income group. I notice the committee talked a good deal of $5,000 and $10,000 incomes. I do not think you will find that those people are in that elegant income group; I think you will find they are in a low-income group.

Senator GUFFEY. In my State 261,722 filed joint returns for that year and 9,518 filed separate returns.

Mr. PRICE. I think that that was more a matter of convenience, Senator, than to seek to lower the taxes. What State are you from, may I ask?

Senator GUFFEY. Pennsylvania.

Mr. PRICE. Pennsylvania is a very rich State.

Senator GUFFEY. They wanted to pay their taxes. They were not trying to dodge them. I will say that 9,000 are making a lot of fuss now about it.

Mr. PRICE. I think it goes further, Senator, than just the question of whether you are going to get additional income from these people or not. I think it strikes fundamentally at the right of the individual as such to have equality before the law.

Senator GUFFEY. Do you have any theory, any program here to raise the $3,000,000,000?

Mr. PRICE. Yes. I agree with Secretary Morgenthau that the base should be broadened.

Senator GUFFEY. What?

Mr. PRICE. I agree with Secretary Morgenthau that the base should be broadened, at least by lowering the exemptions.

Senator GUFFEY. He did not cut out the joint returns.

Mr. PRICE. No, no. I said I agree with him on the broadening of the base. I think that would raise part of it. I would not be so presumptuous as to estimate how much additional revenue it would raise.

Senator GUFFEY. Do you have the kind of program that puts the taxes on somebody else?

Mr. PRICE. No; I do not have that kind of program.

Senator GUFFEY. I am sorry for the interruption.

Mr. PRICE. I was going to mention that I believe Senator Barkley mentioned the other day that he had some question in his mind about reviving the concept of the common law, that what a woman earns

or has belongs to her husband. Now in the process today, we do not recognize that, and I wonder if it would not be well to consider possibly that we have been viewing the common law as a static thing when it should be viewed as dynamic. As you know, originally, the common law came about as the early judiciary decided in each section, what was actually done in that section and they decided accordingly. Today we commonly look upon a woman as absolutely equal to a man. Could not we change the common law? Would not a liberal court interpret it to mean that she has absolute equality before the law? If you deny the woman the right to hold that income herself, would not that carry over to deny her the right to hold property that has been transferred to her?

I notice quite a section in the House report relative to property transferred to wives.

The CHAIRMAN. Now, Mr. Price, that is not involved. There is not but one thing involved. Of course, the question of policy is a very big one, but one legal aspect of the whole thing, that is, whether or not it is reasonable or sensible or a justified classification of taxpayers by simply saying that those who occupy the relationship of husband and wife, who live together, may be treated as one taxpayer.

Mr. PRICE. Thank you for setting me straight, Mr. Chairman.

The CHAIRMAN. Do not worry about the other part. We have the jurisdiction anyway, if it was involved in it.

Mr. PRICE. My opinion still stands then; that it does jeopardize the right as an individual and I think it is very unfair.

The CHAIRMAN. That is a question of policy.

Mr. PRICE. Yes.

The CHAIRMAN. The question of justice, of course, is involved.

Mr. PRICE. That is a question that only the conscience of the committee and the Senate can decide, as you have no restrictions as to how much or in what manner you will levy your income tax.

I had started to mention about the broadening of the base. I have not figured any estimates on it, because, as I said before, I do not think any one of us in a private capacity, has the resources that would enable us to make an estimate such as the Treasury Department can make. My purpose in favoring the broadening of the base, in other words, lowering the exemption, is because I believe it will drive home to the individual taxpayer his financial responsibility to the Government in addition to raising additional revenue. I think that there is a tendency in recent years—we have been talking of billions of dollars of appropriations and the average man has been inclined to think, "Well, that does not affect me. They have been borrowing money. I do not understand billions anyway." I think if you drive it home to him by reducing the exemptions, he will take a greater interest and realize he actually has financial responsibility to the Government, and it will bring in that lower income group who, I believe do want to make some contribution.

In that connection, I think the simplified set-up as suggested by Secretary Morgenthau is very good. I might add you might give them the alternative of computing their tax, the same as anyone else would, if anyone thinks they might be inequitably treated.

The CHAIRMAN. What the Secretary proposed there was simply an option of a short form, that is all. It is not binding.

Mr. PRICE. He did make it optional?

The CHAIRMAN. Oh, yes.

Mr. PRICE. I have often felt that some simple method should be devised, because so many people are turning to other individuals and they pay money to assist them in paying taxes. I do not think the low income group have to pay anybody to help them make out the taxes that they pay to the Government; they ought to make it themselves.

There is one other point on the excise, or the nuisance taxes. I do not see that you have to contract that right away. I do not think that will answer the problem. I think you should be a little bit careful in how many additional taxes you add on, because it conceals the true cost of the Government to the people. In the cases where the taxes are actually labeled, they get some idea but in most instances the taxes are hidden and the cost of government is hidden and most people pay without realizing it. I think they should know how much the Government is costing them to run. They are entitled to know that.

I think the problem, as far as the smaller taxpayer is concerned, divides itself into the equity of the bill and the equity of its administration. As to the equity of the bill, of course that rests within the conscience of the Congress. As to its administration, you will have to delegate the administration of the bill to the Treasury Department, and I have been somewhat concerned with the burden that is placed on some of the collectors of the offices when it comes to the matter of handling refund claims of small taxpayers.

I know they have had lots of them in the past, and there is no unifying the agency similar to a small-claims court that could give them a final and equitable decision. It is too expensive for the small man, who, perhaps has overpaid $30 or $50 to try to fight that through the tax board, so if he is turned down, he hasn't got someone to go in between for him, he just lets it go, but it engenders a misunderstanding between the individual taxpayer and the Treasury Department. If anything could be worked out for him in that respect, it would be a good thing. I think it would redound to the benefit of the Government.

I think there has been a tendency today, on the part of some witnesses, to divorce the revenue measure from the war economy that we are operating under. I recall one witness mentioning something about increased taxes acting as a deterrent on inflation. I think that the Congress, in levying the tax, has every right to levy a tax in every way that will benefit the economic welfare of the country, but I do not think the higher taxes alone would act as the deterrent that some think it might. I think it is tied up with that also, considering the integration of a price-control bill with it. It is not the purpose of this hearing to discuss price control, or the price-control bill, but I think it might be borne in mind that you have got to integrate those two aspects of your fiscal problem, you have got to realize the fact that the tax alone will only go part way, and unless you enact the other, you will not get the desired effects.

I am going to close as I have overrun my time. I am just going to say one word about the excess-profits tax. As nearly as I can judge, the theory of the Treasury Department is that they are seeking a fair return on the capital during the period of the emergency. Some have been worried about it destroying the incentive for capital to

become invested in business enterprise; under war economy, I do not think you have to worry about incentive of capital to be invested in new enterprise; all you have to be worried about is that the existing enterprise will return to war production. If we need to establish new plants for war production, the defense corporation is very glad to furnish the money, and you have been very generous in providing the amortization clause, which is a sufficient incentive for anyone who is entering war production.

I believe that there is one possible objection to merely a rate of return on invested capital, and that might be in the cases of smaller corporations where it is difficult to determine the amount of their invested capital. There are some very small ones who have very little invested capital and yet perform essential services. There is one inequity that will have to be considered and you will have to see if there is some way around it. The only advice I can give to anyone on that is if you should penalize, to some extent, say $100,000, you might as well dissolve your corporations and make them a partnership. I believe that is all.

The CHAIRMAN. Thank you very much, Mr. Price.

Mr. Robert B. Skinner.

STATEMENT OF ROBERT B. SKINNER, OF NEWARK, N. J., LAUNDRY MACHINERY MANUFACTURERS' ASSOCIATION, LAUNDRY AND CLEANERS ALLIED TRADES ASSOCIATION, AND AMERICAN INSTITUTE OF LAUNDERING

Mr. SKINNER. Mr. Chairman and gentlemen of the committee, I have, in my hand here, a statement of our position in connection with the phase of the bill at hearing that we object to, and if it meets with your consent, I would like the privilege of reading that statement. It is very short.

The CHAIRMAN. You may proceed.

Mr. SKINNER. After that, if you wish to ask any questions, of course, I shall be glad to answer them.

My name is R. B. Skinner, a laundry owner whose business is situated in the city of Newark, N. J. I have the honor of having been appointed to speak for the American Institute of Laundering, the national association for the laundry industry, whose members process approximately 75 percent of all of the laundry work done in this country; and also for the Laundry Machinery Manufacturers' Association and the Laundry Allied Trades' Association, each of which does 95 percent of the total sales in their respective fields.

The purpose of our appearance here is to place before you our reasons for protesting the inclusion in the bill at hearing, namely H. R. 5417, a tax of 10 percent on washing machines of the kind used in commercial laundries. This tax is recorded on page 75, paragraph 8, subsection 3406 of section 552, reading as follows:

> Washing machines of the kind used in commercial laundries, 10 per centum. No tax shall be imposed under this paragraph on washing machines of the household type.

The laundry industry as you must know, is a service industry. It manufactures nothing; it simply reconditions the linens and wearing

apparel for a large part of the people of this Nation. In addition to this, however, and even far more important it serves in a very large measure to maintain the health, the well-being, and the morale of all of our people. In no sense is it a luxury industry. It serves a very vital need of all of our people. In connection with this, it might be of interest to know that the American Institute of Laundering is at the present time in conference with the Office of Production Management and the Office of Price Administration and Civilian Supply and with Secretary Ickes, as Petroleum Fuel Coordinator, requesting that the necessary supplies required by the laundry industry be placed on the priorities list because our industry is so highly essential to the health, and so forth, of our people.

During the first World War, the Priorities Board at that time declared that the laundry industry should be placed on the "Preference list of industries whose operation as a war measure is of exceptional importance."

Attached to this brief is a copy of a brief sent to the three departments mentioned before. The principal points brought out in the attached brief are summarized as follows:

1. 10,000,000 families or approximately 35,000,000 people depend upon laundries for their family washing. In addition, the laundries are essential with hospitals, hotels, charitable institutions, steamship lines, railroad lines, and many other institutions of like character.

2. Continued and uninterrupted operations of laundries will result in great savings of supplies, labor, and power during the period of the emergency as compared with home methods.

3. Laundries are essential in maintainmg public health and national morale.

4. Laundries provide regular employment to 250,000 people, of whom 70 percent are women with annual wages of $275,000,000 as against an estimated sales volume of $500,000,000.

During the last few years the laundry industry has gone through a very trying period. It was found that if prices were raised, it would lower the volume, and volume is necessary to properly operate a service organization. Prices at the present time are, in the main, even lower than before the imposition of such taxes as old-age benefits, social security, State unemployment, and so forth.

The total volume of sales is divided among 6,700 different small plants scattered throughout the United States, the vast majority of whom are operating heavily mortgaged plants with insufficient capital. The records show that the average earnings of the most successful groups in the industry are less than 2 percent of sales. We recognize that all industries are called upon to pay social-security taxes, but in the case of the laundry industry, because our pay roll amounts to 55 percent of our total revenue, it is a particularly difficult burden to bear. It seems to us, therefore, in view of the above reasons given, that the laundry industry is in no position to bear any further tax burden at the present time.

It is our contention that under this bill a tax on commercial washing machines is discriminatory in its nature principally because it fails to tax many other types of processing machines in a variety of other industries. It is not in order for us, of course, to list these numerous industries but we refer to those industries that are serving civilian

needs. In other words, why particularly should the laundry industry be singled out to bear this extra tax when many other industries serving civilian needs are not called upon to bear a similar tax.

We could not even understand this discrimination if the revenue which is to be derived therefrom would be a substantial amount. It is liberally estimated by the laundry-machinery manufacturers that their sales in commercial washing machines for 1940 amounted to about $4,500,000. On this basis, the total tax of 10 percent would yield a revenue of only $450,000 as against the estimate of $1,100,000 as reported by the House Ways and Means Committee.

For obvious reasons, the volume of sales for the duration of the emergency will probably be greatly reduced over 1940 with the result that the revenue derived from this tax will be far less than the figure here quoted.

We note with particular interest that the home washing machine is not taxed. Just exactly why, we do not know but it is our understanding that one of the principal reasons why the home washing machines are not taxed under this bill is because it is considered a device for relieving the American housewife of much of her home drudgery.

If this argument be true, how much more so it applies to the commercial washing machine. The home washing machine may relieve her of some of the drudgery but the commercial washing machine relieves her of all of the drudgery; furthermore, it is hard to understand why a tax should be placed on a processing machine that serves to keep many people in employment and no tax is placed on a washing machine going into the home that tends to decrease employment in the commercial laundry. In view of the present emergency, it would seem axiomatic for the Government to do everything possible to encourage employment and not to discourage it.

The home washing machine is a direct competitor of the commercial laundry and it seems highly unjust and discriminatory to place a tax on commercial washing machines.

Senator TAFT. Do you have any figure on the total volume of individual and commercial washing machines?

Mr. SKINNER. The sale of washing machines?

Senator TAFT. Yes.

Mr. SKINNER. I have with me Mr. Matthews, who is prominent in the field of laundry machinery manufacturing, and Mr. Matthews is able to answer the question with more authority than I.

Mr. MATTHEWS. For 1940 the report is $104,000,000, 1,456,000 units.

Senator TAFT. As compared to what?

Mr. SKINNER. As compared to $4,500,000 on the commercial washing machines. Our plea, then, is based on four main contentions: First, that we are in no sense a luxury industry but serve a very vital need in maintaining the health and the well-being of our people; second, the financial condition of laundries and machinery manufacturing companies is such that to impose this 10-percent tax on them at this time would inflict a hardship far out of proportion to the anticipated revenue from the proposed tax; third, that the tax as it now stands is discriminatory in that it singles out the laundry industry; and fourth, that it creates a condition of unfair competition by taxing

a processing machine of the laundry industry while it fails to tax in a like manner the source of our greatest competition—the home washing machine.

We, therefore, respectfully urge this committee to strike out paragraph 8, subsection 3406 of section 552 on page 75 of the bill at hearing.

(Mr. Skinner submitted the following brief:)

BRIEF CONCERNING PRIORITY AND PREFERENCE RATINGS ON LAUNDRY MATERIALS, SUPPLIES, AND EQUIPMENT REQUIRED AND USED BY THE LAUNDRY INDUSTRY OF THE UNITED STATES

Prepared by AMERICAN INSTITUTE OF LAUNDERING, Joliet, Ill., July 18, 1941

Submitted to: Harold L. Ickes, Secretary, Department of the Interior; Edward R. Stettinius, Jr., Director of the Office of Production Management; Joseph Weiner, Assistant to Leon Henderson of the Office of Price Administration and Civilian Supply

We submit that the laundry industry, especially in this period of national emergency, is essential to the health, well-being, and morale of all of the people in the Nation.

If, in the judgment of those to whom the responsibility has been entrusted, it becomes necessary to reduce the varieties and quantities of services and commodities now available to the general public, in order to expedite an all-out defense program or to prosecute a war, the laundry industry of the United States submits the following reasons in support of its contention that it is an essential industry to the public welfare, and, therefore, entitled to preferential treatment by those governmental agencies entrusted with the responsibility of allocating those commodities essential for uninterrupted operation of the laundry industry.

CONTINUOUS LAUNDRY OPERATION ESSENTIAL FOR MAINTAINING PUBLIC HEALTH

Any reduction in the Nation's standard of cleanliness and personal hygiene will contribute to an upswing of the inroads of disease and epidemics with their resultant loss of man-hours throughout our defense industries and armed forces. Everyone will recall the "flu" epidemic of the first World War and the disturbing effect it had, not only upon the Nation's military forces but also upon the civilian population and factory production. Even in those days when far fewer professional laundries were in existence than is true today, they were very useful in combatting the spread of an epidemic that admittedly was serious. The value of every present-day laundry in a similar situation should not be discounted. (Research data on the sanitary condition of the commercial laundry output will be furnished gladly.)

Within continental United States, at least 10,000,000 families are depending upon the laundry industry for the weekly washing and ironing of their linens and wearing apparel, while, in addition, the laundry industry is vital in the operation of a wide range of public and private institutions including:

Hospitals.
Asylums.
Orphanages.
Sanitariums.
Commercial and industrial cafeterias.
Army cantonments.
Naval stations.
Schools.
Work camps.
Physicians' and dentists' coat and towel supply service.
Civilian Conservation Corps camps.
Coastwise shipping.
Dining and sleeping car railway service.
Restaurants.
Hotels.
Mechanics' overall service.
Towels in commercial offices and industrial plants.
Commercial air service.
Public baths and pools.
Federal construction project camps.

Thirty-five million of our citizens, who constitute the 10,000,000 families referred to (our industry extends into every sizable city and town in the Nation), as well as the thousands of units embraced in the above enumeration of Federal, commercial, eleemosynary, and other types of institutions, depend upon the approximately 6,725 commercial laundries scattered throughout the United States for an indispensable service, any curtailment or dispensing of which would at once create a serious threat to the maintenance of public health.

LAUNDRIES CANNOT OPERATE WITHOUT SUPPLIES AND REPAIR PARTS

Although the laundry industry's chief production requirement is its labor, it does consume annually, at prevailing market quotations, approximately $75,000,000 of essential supplies consisting in the main of fuel, gasoline, soap, detergents, paper products, repair parts, and cotton goods. Any interruption in the supply of these products to the laundry industry must, of necessity, result in suspension or curtailment of laundry service, depending upon how serious the reduction of these supplies or repair parts might become. The laundry industry, in the interest of the public welfare, therefore, petitions that it be officially declared an essential industry for the duration of the national emergency, and that if and when any priorities affecting its needed commodities are declared, it be placed upon such priority list of essential industries.

We would point out that such a recognition was given on April 6, 1918, by the then Priorities Board which functioned during the days of the First World War. By the resolution creating preference list No. 1, the Priorities Board, with Edwin B. Parker as chairman, saw to it that the laundry industry received sufficient fuel and other supplies to continue its daily operations without interruption to the public and the Nation. It declared that the laundry industry should be placed on the "Preference list of industries, whose operation as a war measure is of exceptional importance." Because the ramifications of the laundry industry's service to the public have vastly increased since 1918, it is, more than ever in this present national emergency, essential in the maintenance of public health and morale.

Obviously, if the laundry industry of the Nation is to continue to serve the public, it must receive operating supplies such as fuel, gasoline, soap, detergents, paper products, cotton goods, repair parts, etc. Without these everyday operating supplies, the laundries of America can no longer service not only the public but also, as previously suggested, the hospitals, orphanages, hotels, restaurants, and other public institutions that rely on laundries in order that they in turn may operate.

There, furthermore, is one definite probability that must be considered in the study of the current problem, and that is the factor of economy. It seems obvious that laundry units especially designed for the purpose are in a better position to operate more economically in the matter of supplies than could be the case with many small widely scattered units. As an example of this point, the subject of laundry-soap consumption may well be considered. In hard-water areas, thousands, if not millions, of pounds of soap are wasted annually in home consumption with the use of hard water. Laundries in these self-same areas operate zeolite softening units that remove the hardening constituents of a water supply, thereby saving enormously in soap consumption per pound of soiled goods.

It likewise should be kept in mind that the same equipment and employees that are used to process hotel, hospital, and similar work often are used to launder work from private homes. One cannot be separated from the other. This point is so well recognized in England that the laundry industry is permitted to operate continuously, in spite of the far more serious commodity situation that England faces than does the United States.

Another factor of equal importance is the matter of power. It must be quite apparent that laundries will use far less power when washing and ironing in bulk than would be the case if this work were distributed in millions of homes (even if such a thing were possible), using an almost unlimited amount of electrical power in the home for washing machines, electric irons, etc. As a matter of record, practically every laundry generates its own power, excess steam being used to heat hot water. Thus, laundries relieve the power load on public service stations in areas in which a shortage of power might be felt.

CONCLUSIONS

The following conclusions are recognized facts:

1. Laundries are in the first line of defense against the spread of infectious disease and, therefore, of great value in maintaining public health and national morale.

2. Laundries are essential for the daily living and operation of millions of homes and public institutions, including hospitals, sanitariums, orphanages, steamships, hotels, restaurants, and other similar services.

3. Laundries are providing regular employment to 250,000 people, of whom 70 percent are women.

4. Laundries are even more essential in the modern-day operations of the United States than was the case in 1918, when the industry was declared by the Priorities Board of the day to be an industry of "exceptional importance."

Under the circumstances, the American Institute of Laundering, the national trade association of the laundry industry, respectfully urges that serious consideration be given to the matter of the continuous furnishing of sufficient laundry supplies, gasoline, and fuel to the laundries of the Nation to enable them to render a service which, while providing employment for 250,000 people, results in a service of vital importance to the Nation.

In order that this whole question of declaring the laundry industry an essential one during the national emergency may be brought to final conclusion, we respectfully request an opportunity to be heard before the proper official or officials at an early date. The American Institute of Laundering has appointed a small committee to handle this entire matter, and simply awaits your request for a conference in Washington. Be assured that it is our earnest desire to cooperate wholeheartedly with our National Government.'

NOTE.—*General statistical information.*—The American Institute of Laundering was established in 1883. Its membership processes approximately 75 percent of all laundry work done in the United States.

The CHAIRMAN. Are there any questions, gentlemen, that you wish to ask Mr. Skinner? If not, Mr. Skinner, thank you for your appearance.

Mr. SKINNER. You are welcome, Senator. I thank the committee for this opportunity.

The CHAIRMAN. Do you wish to make a statement in regard to the matter, Mr. Matthews?

Mr. MATTHEWS. I am here just to support Mr. Skinner.

Mr. SKINNER. Mr. Matthews is here simply to support me in a technical way, he being more familiar with the laundry machinery manufacturing business.

Senator DANAHER. Mr. Chairman, one question.

The CHAIRMAN. Yes.

Senator DANAHER. As to whether or not, during the period of the last war, or just subsequent thereto, your industry was taxed on the manufacture of washing machines?

Mr. MATTHEWS. I could not answer that.

Mr. SKINNER. You mean whether there was a tax on washing machines?

Senator DANAHER. Yes.

Mr. SKINNER. I would say "no." I am not 100 percent sure of that statement, however.

Mr. MATTHEWS. There is one thing I might add. The figure given of the $4,500,000 on washing machines is based on the fact that they are built out of monel and nonferrous metals. Well, we cannot get them, so we will have to build wood machines, and wood machines will sell at 40 percent, approximately, less than this figure.

The CHAIRMAN. I do not know whether my recollection is correct, but that is one of the reasons why the defense committee recommended this type, so as to prevent competition with necessary defense purposes.

Mr. MATTHEWS. It is impossible for us to get it. We are out of it and we cannot get it so we will have to go to wood, and when we go to wood, it will be 40 percent less than this, so you see you will get nowhere near the amount of taxes that you expect to get.

Mr. SKINNER. It seems Mr. Stettinius has taken care of that. He has put priority on it so we cannot get but very little monel metal; and very little steel.

The CHAIRMAN. Thank you very much.

(The following letter was received from Mr. Matthews and ordered inserted in the record:)

THE AMERICAN LAUNDRY MACHINERY CO.,
Cincinnati, Ohio, August 15, 1941.

The Honorable WALTER F. GEORGE,
Acting Chairman, United States Senate Committee on Finance,
Washington, D. C.

MY DEAR SENATOR: On Monday, August 11, 1941, I had the honor of appearing with Mr. R. B. Skinner and a group of men representing the American Institute of Laundering (a national association representing 75 percent of all work done in laundries in this country), also the Laundry and Dry Cleaners Machinery Manufacturers Association, and the Laundry and Cleaners Allied Trades Association, each of which represents 95 percent of the volume in their respective fields. The purpose of our appearance was to protest against the proposed 10-percent tax to be placed on washing machines of the type used in commercial laundries. This tax is referred to on page 75, paragraph 8, subsection 3406 of section 552, and reads as follows:

"Washing machines of the kind used in commercial laundries, 10 percent. No tax shall be imposed under this paragraph on washing machines of the household type."

You made the statement during this hearing that one of the reasons this tax was placed was due to the necessity of restricting the use of monel and nickel in the manufacture of these machines. It was pointed out it is now impossible to secure any of these materials, even though we do not have a tax at the present time.

It was expected that a revenue of $1,100,000 would be realized on the basis of a 10-percent tax on the sale of commercial washing machines. It was brought out this was in error. It was liberally estimated that during the year of 1940 not over $4,500,000 worth of commercial washing machines were manufactured in this country. In the year 1941 the amount of sales probably will be increased considerably due to the fact the Government purchased a large number of this type machine for cantonment laundries. However, the Government is not subject to tax; therefore, the revenue would be materially reduced and it would be questionable whether during the year of 1941 even $350,000 would be realized if a tax of 10 percent were imposed on the sale of all commercial washing machines.

We are faced with the necessity of substituting wood in the construction of commercial washing machines due to the fact that it is impossible for us to secure noncorrosive metals. In event we do manufacture machines of wood, the selling price would be reduced at least 40 percent over the price of those machines manufactured of noncorrosive metals, which would mean a large reduction in the estimated amount of revenue to be derived from such a tax.

Furthermore, this tax is discriminatory due to the fact, as brought out in the brief by Mr. Skinner, it taxes one type of processing machine, and many other types of processing machines bear no tax whatsoever.

The household washing machine industry, which is a direct competitor of the commercial washing machine, manufactured in the year 1940, $104,000,000 worth of household washing machines. A 1 percent tax on this class of machine would bring forth as much money as it was expected to receive from the proposed 10 percent tax on commercial washing machines.

In view of the fact that this proposed tax is so discriminatory we are asking you to support us in our plea to remove this proposed 10 percent tax on commercial washing machines from the new tax bill.

Respectfully submitted.

THE AMERICAN LAUNDRY MACHINERY CO.,
By A. MATTHEWS,
Assistant to President, General Sales Manager.

The CHAIRMAN. Mr. Hugh M. Bennett.

STATEMENT OF HUGH M. BENNETT, COLUMBUS, OHIO, REPRESENTING THE SUPERINTENDENT OF INSURANCE OF OHIO

The CHAIRMAN. Mr. Bennett, would you please give the reporter your name and address, for whom you appear here, if you appear for someone other than yourself?

Mr. BENNETT. Mr. Chairman, my name is Hugh M. Bennett and I appear on behalf of the Superintendent of Insurance of Ohio. I have a prepared statement which it is my hope you will receive in due course and permit to be placed into the record. I would rather not read the statement, I would rather speak informally to the members of the committee.

The CHAIRMAN. You may put your statement in, Mr. Bennett. We would rather approve that course, if you are ready to explain what you have in mind without reading the statement. You may give it to the reporter and it will be inserted in the record, or such parts of it as you wish.

Mr. BENNETT. The American Insurance Union is one of the old fraternal benefit societies that have rapidly passed out of existence. It had more than 20,000 members and its claims are widely scattered throughout the United States, and in fact the company was, at one time authorized to do business in 28 different States.

It became necessary to reorganize almost its sole asset, the largest office building in the city of Columbus. It is a 46-story building. For the purpose of that reorganization they used the method that all you lawyers on the committee understand, and that is, the equity foreclosure method to transfer title from the predecessor.

Senator HERRING. Some of the rest of us understand it, too, some of us who are not lawyers.

Mr. BENNETT. If you had that misfortune, that really calls for sympathy.

Of course, the old American Insurance Union issued a block of bonds to build the building back in 1927. A committee was directed to be formed by the court in Ohio to solicit the deposit of these bonds. A plan of reorganization was approved by two courts, the Federal court of Columbus as well as the Ohio Court of Appeals. As a result the plan was consummated finally by having a sale made at an upset price fixed by the Federal judge, and the sale transferred the title to the taxpayer corporation in this case. The sale was made for $1,650,000, which I submit has no bearing whatever upon the value of the property. The property cost in 1927, exclusive of the land, $8,000,000 approximately. I submit naturally that that is not its value today, nor was it its value on July 1, 1937, when the transfer of title was supposed to have taken place but which was not finally consummated, due to court involvement, until December 16, 1938.

Now, I am not down here, gentlemen, pleading the case of an individual taxpayer. I merely go into these preliminary details for the purpose of laying before you an illustrative case which applies to hundreds of corporations in this country.

The Treasury may say to you, as they said to me when I thought I might get relief without an amendment to the law, that this was an isolated transaction. There are over 15 cases today, either in the

circuit courts of appeals or the United States Supreme Court involving analogous angles, which has led to a great amount of litigation, a great amount of expense, and the Government has not received its tax. The solution is not administrative, the solution is not judicial, the solution is legislative.

The Treasury said that the solution might lay with the administration of the law. The reorganization sections are so complex that Mr. Stam himself will tell you that perhaps they are not easily understood, and I know that for the professions, either in the accountancy profession or legal profession, they are not understood at all.

Now, the immediate problem which brings me before the committee is because in last March the Congress of the United States repealed section 722 of the Excess Profits Tax Act of 1940. Section 722 vested in the Commissioner absolute discretion to give relief where there were abnormalities in invested capital. Today we do not have that privilege. I have perfect faith in the Commissioner. Some groups did not want to vest that power in the Commissioner and therefore they sought to have the section stricken out. The result is that today there is no relief where a corporation has an abnormality in invested capital, yet the excess-profits tax credit is based upon the invested capital.

I say that the revenue law now being considered by this committee, by the Senate, and by the entire Congress eventually, should provide that when a judicial sale occurs and there is a transfer of title to a new corporation, the transferee corporation should receive the same basis as the transferor whether it comes within the technical definition of tax-free reorganization or not. Why do I take that position? The Treasury very properly protected the Government in July last year by sponsoring before the Congress, and the Congress passed it as an amendment to the Chandler Act, an amendment to the bankruptcy law by which not to exceed the fair value of the property transferred through a bankruptcy reorganization could be used as a basis for the transferee, that is, the purchaser at the bankruptcy sale. But I submit, and all of you lawyers know that all corporations cannot use the bankruptcy law. Municipal corporations, insurance companies, building and loan companies, and banks cannot reorganize through bankruptcy, never have been able to do so, yet there is a gross discrimination against those corporations because they cannot seek that method of reorganization. The American Insurance Union was an insurance corporation under the insurance laws of Ohio. It could not reorganize this large office building, 46 stories in height, except in one manner, that is, through an equitable foreclosure suit.

The Treasury's purpose in having the Chandler Act amended last summer was to prevent, so it has been explained to me by the Treasury, a group of bidders who had the defaulted bonds getting together and pooling their interests through deposit with a committee, which is a usual method, or any other manner, whereby the interests are pooled, and getting an upset price fixed that was away in excess of the market value of the property at that time and using it as a base.

Let us see what might have been done. The bondholders in this case, instead of bidding $1,650,000 for this building, we have enough

bonds with accrued interest that were in default, could have bid approximately $4,000,000 for this building. There would have been no doubt that our base then, under the section 112 of the Revenue Act would have been $4,000,000, but because we only paid $1,650,000, which is an arbitrary upset price, the Treasury says and the Commissioner says:

> That is your basis, that is all you can have as invested capital, that is all you can have as a basis for depreciation. If you sell your building later, that is all you can have to compute your gain or loss.

I submit that the books are full of precedents that the fair market value has very little, if anything, whatever, to do with a foreclosure sale price, therefore I ask that in all judicial sales the basis be the predecessor basis. If there must be a limit on it, I say limit it to 50 percent of the predecessor basis. In fact, I do not see why there should be a limit at all, but if from political expediency, economic expediency, we cannot have a full predecessor basis passed on to the transferee, then put a 50-percent limit on it. I will show you in a moment why I arrive at 50 percent.

May I reiterate for a moment by saying there is no sound reason why an industrial plant, a manufacturing establishment, should have the privilege of reorganizing through bankruptcy and having the benefit of the amendment of last summer, in July, by which its basis is its predecessor's basis, but never to be more than the fair market value of the property at the time of the transfer.

If this present contention of the Commissioner in his enforcement of the law would prevail, that would destroy entirely the invested capital of this new transferee company which was created by the superintendent of insurance in Ohio to hold title to this tall building. Why would it destroy all such credit for excess-profits taxes? Because the old bondholders had to receive new bonds; those bonds were scaled down. The old bond issue face value was $3,450,000, virtually $3,500,000. They scaled it down to $2,600,000, and therefore the new corporation owes money today. The building, if it is to be valued as the Commissioner contends, is to be valued at $1,650,000, the foreclosure sales price, therefore we are insolvent when we get through with our reorganization. We owe $2,600,000 and we only have $1,650,000 of assets, but as a consequence we have no invested capital because we owe more than we ever put into the business, according to his computation. We are only allowed to use 50 percent of borrowed money for invested capital in applying the credit under the Excess Profits Tax Act.

The demand of the Commissioner, I say here in my statement, is so extreme as to be almost absurd, because we have a 46-story building completed in 1927 at a cost of a little in excess of $8,000,000 exclusive of the land, and it is now to be limited for invested capital purposes, for depreciation purposes, for gain and loss purposes to $1,650,000.

Now, there has been placed before the desk of each member a computation sheet which is marked "Exhibit A." I direct your attention particularly to columns 3 and 4, which show the unjust and inequitable result by applying the present rule as insisted upon by the Commissioner. In other words, in column 3 there is the situation which confronts this particular company and hundreds of other companies just like ours if the foreclosure sale price is the basis. In other words,

the taxable income is $113,000 annually there. Yet if the rule for which I contend, that is a sound reproduction value, is adopted by an amendment to the law, the income which would be subject to the income tax would be $56,000. You will observe, however, that if we would have the predecessor basis we would have a net loss before the reorganization, as shown in column 1, of $120,000, and in column 2, if it is a nontaxable reorganization, we would have $14,000 net loss. Well, the Government has its eye out for revenue, so naturally it construes all these reorganization cases to be taxable reorganizations, so they are denied their predecessor basis.

Senator HERRING. Mr. Bennett, what is the assessed value for real-estate taxes?

Mr. BENNETT. I do not happen to know, Your Honor.

Senator HERRING. You do not?

Mr. BENNETT. I do not happen to know.

The CHAIRMAN. Mr. Bennett, the Commissioner would not allow you to set up the fair market value of the property?

Mr. BENNETT. He is not interested in hearing us on the fair market because of the United States Supreme Court decision in the *Midland Mutual Life Insurance Co. case* (300 U. S. 216). If you would adopt the bankruptcy rule, that is the last July bankruptcy rule, the rule of last summer, in the tax law, then, of course, he would have to hear us on fair market value. His regulation, but not the revenue law, says he should hear us on fair market value, because the regulation says, I think it is in paragraph 19.23 (k) 3, if I remember my symbols properly, that any foreclosure sales price shall be determined to be the fair market value unless "clear and convincing evidence" is introduced to the contrary, but if it is a nontaxable reorganization we get the predecessor basis, and if it is a taxable reorganization we get the foreclosure sale price unless they will hear us on fair market value. It is impossible to find "clear and convincing evidence" of the fair market value of a 46-story building at a given time when there are no comparable properties sold at about the same time. I want a rule in the law by which fair market value is written into the law, but preferably a sound reproduction cost, because I submit that property of this type and character does not have a fair market value. For it, there is not such a thing as fair market value.

A 46-story building in our little city will not be sold in a quarter of a century, and I do not believe it will be sold in half a century. I do not believe there are any comparative properties from which you will find fair market value. We have in the State of Ohio only four properties with which this might be compared, and they are all in other cities. Fair market value is the most ellusive test in the world. What is fair market value for a white elephant that nobody wants? It does not have a fair market value. I want a formula used that is real, that is genuine. I want a sound reproduction cost that is capable of engineering computation and of careful computation in a court. Fair market value means nothing, Mr. Chairman, with relation to a property of this kind.

The CHAIRMAN. You have got a building reproduced in a place where there is no demand for it at all. You might have the same situation there. It might be utterly worthless.

Mr. BENNETT. Nevertheless there would be the invested capital. If somebody was foolish enough to put that building up, although they would not get a return they would have the invested capital and they would be entitled to their credit against the excess-profits taxes on that invested capital. If this is an improvident investment, that is their loss, but they should not be penalized by being deprived of the 8 percent or 7 percent on the invested capital.

Senator TAFT. Mr. Bennett, the new company in this case is a company the stock of which is owned by the State of Ohio?

Mr. BENNETT. Fifty percent of it is owned by the State of Ohio.

Senator TAFT. Fifty percent of it is owned by the bondholders?

Mr. BENNETT. By the bondholders.

Senator TAFT. And 50 percent by the State of Ohio?

Mr. BENNETT. For the benefit of the old policyholders.

Senator TAFT. The old policyholders of the old company?

Mr. BENNETT. That is right.

Senator TAFT. So it is really a continuation, largely, of the old company?

Mr. BENNETT. That is right.

Senator TAFT. Do I understand that although you may have a loss, for instance, of $120,000, a net loss for income-tax purposes, for the ordinary accounting purposes you still might have to pay a tax of $113,000?

Mr. BENNETT. A tax on $113,000.

Senator TAFT. A tax on $113,000 of income?

Mr. BENNETT. That is right.

Senator TAFT. That you haven't got?

Mr. BENNETT. That is right. Now, exhibit B to this statement of ours is now being placed on your respective desks, and that shows the result if we would use the bankruptcy rule which is in the United States Code today as an amendment of last July to the Chandler Act. If you will use a fair market value there of $4,000,000 the result is that we will have a taxable income of $66,000. Now, that is just one-half of the cost of the building alone, the $4,000,000, it is less than one-half of the entire investment in the land and building. I say that the revenue law has for many years recognized the 50-percent rule in relation to individual investors, that is in relation to individual bondholders. In other words, under the capital gains and losses provisions of the revenue laws it is provided that where bonds or other securities are held for 2 years or longer, then are sold or exchanged, the result in taxable gain or loss is taxable only to the extent of 50 percent of that actual gain or loss.

Thus, the 50-percent clause, I submit, should now be extended to corporations themselves; that is, if they are in presently taxable reorganizations. I hope that this type of reorganization will be nontaxable by amendment to the law, but today, of course, it is called a taxable reorganization according to the contention of the Commissioner. This we disputed, of course, for the matter of the record.

Now, what specifically is it that we seek? This is stated in the following language in my statement, which I ask to be included in the record. I urge that section 112 (g) (1) of the Internal Revenue Code, which now defines a tax-free reorganization, be amplified so that a transfer of substantially all the property of one corporation to

another corporation by any judicial sale will be included. Now, this will require an amendment to section 113 (a) (7), that is the basis section, so as to conform it to the amendment, if made, to section 112 (g) (1).

Why, I repeat, gentlemen, there should be all of this favoritism shown to a reorganization carried out through bankruptcy when it is impossible to have the same tax result if you carry your reorganization through equity foreclosure, through execution, sale, after a judgment, through an attachment sale, or through the repossession of property by a transfer under a trust indenture which is permitted in some States without any judicial process whatever, I do not know. Why should only bankruptcy get the preferential treatment?

Now, I say that the Government itself should have the protection which I urge should be extended to the tax law from the Chandler Act. Why do I say that? The Government requires the protection for the reason that this corporation, these bondholders, could have done the very thing that the sharp fellows could have done last July with relation to a bankruptcy reorganization. We could have bid our property at $4,000,000, we could have had that as a basis, and we could have used that in computing our depreciation, we could have used that in determining our credit against the excess-profits tax, but because we did not run up the price at the sale in 1937, before we ever thought of an excess-profits tax or invested capital, now we are penalized as we could not use the bankruptcy method of reorganization, nor can hundreds of institutions use it, or corporations, because it is barred to them, it is denied to them.

I do not see why the tax law cannot invoke the same rule that the Chandler Act has used.

The CHAIRMAN. You are going on the presumption that if you have no evidence of market value that what you gave for the land and building is to be taken into consideration, and if it were nontaxable land it should take the basis of your transferor, the original taxpayer.

Mr. BENNETT. If it were nontaxable we would get the predecessor basis.

The CHAIRMAN. You would get the predecessor basis?

Mr. BENNETT. That is right, Mr. Chairman.

The CHAIRMAN. And they have held this to be taxable.

Mr. BENNETT. They have not held anything about this yet. It is just in the state of flux.

The CHAIRMAN. Maybe it is better than you think.

Mr. BENNETT. I do not think so. I am trying to be a realist about this.

The CHAIRMAN. We get your point; I think the committee does. You think at this time this equity foreclosure proceeding through which this particular property, as an illustration merely, has gone, that that ought to be regarded as tax-free, or that some other equitable rule should be worked out rather than the application of the strict nontaxable reorganization.

Mr. BENNETT. I think wherever there has been a transfer of title by judicial sale that should be the case.

The CHAIRMAN. I understand.

Senator JOHNSON. Does your trouble all grow out of the excess-profits feature of the tax bill?

Mr. BENNETT. When section 722 was repealed then our troubles began. I would never be here if you had not repealed section 722, as it was enacted last year, in 1940, as a part of the original Excess Profits Tax Act. Then the commissioner had a right to give an adjustment for abnormality in invested capital. Here is a building that stands 46 stories high: What is our invested capital? According to the commissioner's contention it is $500, the cash paid in when the taxpayer was incorporated.

Senator TAFT. It is all in the top brackets?

Mr. BENNETT. Yes; it is in a top bracket. We reorganized to save money to the policyholders. As I say in my statement, we would have been much better off to have stayed in receivership forever, because in receivership we would have had the predecessor basis, we would have enough for depreciation, we would have enough to pay the income tax, our policyholders would get something. We have now to give our earnings, that we have tried to conserve for the policyholders, for excess-profits taxes. We do not have any war industry, we do not have any armament, defense work; we simply rent offices in a building and in a hotel, and yet we are in a top bracket, as Senator Taft points out, for the purpose of the excess-profits tax. If you cannot restore section 722, then let us have it defined, and give us a sound reproduction value as a measure for our basis.

Thank you.

The CHAIRMAN. Thank you very much, Mr. Bennett.

(The brief submitted by Mr. Bennett is as follows:)

BRIEF IN SUPPORT OF RELIEF RESULTING FROM ABNORMALITIES IN INVESTED CAPITAL IN THE COMPUTATION OF EXCESS-PROFITS TAX

My name is Hugh M. Bennett. I appear here on behalf of the Superintendent of Insurance of Ohio, as an attorney-at-law from Columbus, Ohio. For the last 8 years the Superintendent of Insurance of Ohio and I have been serving as coreceivers of the American Insurance Union, which was a fraternal benefit society located in Columbus, Ohio, and organized under the insurance laws of that State. This insurance company has more than 20,000 members and claimants widely scattered throughout the 28 States in which it was qualified to do business.

The insurance company owned a 46-story office building, which is the largest building in Columbus. Exclusive of the land, the building itself cost approximately $8,000,000. Due to the financial involvement of the insurance company, it was necessary to reorganize the above office building property through the means of an equity foreclosure proceeding in the United States District Court at Columbus, and also through a quo warranto action in the court of appeals of Franklin County, Ohio, which also sits in Columbus. This reorganization was concluded in December 1938. One of the steps to consummate the reorganization was a foreclosure sale in the United States District Court in an action instituted by the trustee for the holders of mortgage bonds, secured by a mortgage on this office building. The bond issue went into default in 1932 because the insurance company was unable to pay principal installments and interest due thereon.

Bondholders' committees were organized in 1933 and 1934 to protect the holders of these mortgage bonds. These committees agreed upon a plan of reorganization which was approved by both of the above courts. This plan provided for the above-mentioned foreclosure sale, so as to transfer title from the insurance company to the present taxpayer corporation which holds title to the office building.

The superintendent of insurance as coreceiver of American Insurance Union, under the reorganization plan holds 50 percent of the outstanding capital stock of this new transferee corporation which is named Fifty West Broad, Inc.

These bondholders' committees, acting on behalf of this new corporation, which the plan proposed should be organized, bid in the property at the foreclosure sale for an upset price approved by the Federal court for only $1,650,000. This

upset price was paid for the most part in the old mortgage bonds issued by the insurance company, which bonds had been deposited with the committees by the holders thereof.

I have gone into this detailed statement of our own situation because it is illustrative of hundreds of other comparable situations throughout the United States. As many of the lawyers on the Senate Finance Committee know, this method of reorganizing a company in financial difficulties is customary and has been uniformly followed in Federal and State courts for more than half a century. The relief which should be granted to Fifty West Board, Inc., should be by means of a general provision which would bring more equitable tax treatment to hundreds of other corporations created in a similar manner because of financial difficulties.

The immediate problem which has prompted me to appear before you today was created only in March of this year by the repeal of section 722 of the Excess Profits Tax Act of 1940. Section 722 thus repealed gave to the Commissioner discretion to grant relief from undue hardship resulting from abnormalities in invested capital. Since March of this year the Commissioner has no such power or authority and the taxpayer with an abnormal invested capital is without any means of redress.

The revenue law now being drafted should afford more equitable tax treatment by means of a provision which would give to the transferee corporation, acquiring title by a judicial sale or by means of the foreclosure of an instrument of lien securing the defaulted securities of the transferor corporation, the sound value (reproduction cost depreciated), or at least the value fixed by the Chandler Act amendment in July of last year, but not less than 50 percent of the basis of the transferor or predecessor corporation. This basis should also be the measure of invested capital under the Excess Profits Tax Act. This relief provision should apply in all instances of taxable reorganization, where gain or loss is recognized, involving judicial sales such as mortgage foreclosures, judgment executions, attachment sales, sales for nonpayment of real-estate taxes, and as mentioned above, transfer of title in those States where the law permits it without judicial process, but in according with the provisions in the instrument of lien.

I do not propose that such an amendment to the Revenue Act should apply to sales in a bankruptcy proceeding because the Congress in July 1940 amended the Chandler Act to protect the Government from the scheming of taxpayers to get a very high base by having an upset price fixed by the bankruptcy court at an amount which could be bid by holders of the defaulted bonds, but, nevertheless, much in excess of the then fair market value of the property. However, I do urge that, at least, the basis for corporations resulting from reorganizations under the Chandler Act, as amended in July of last year, should be made available to all corporations resulting from reorganizations under any other procedure. The Government requires the protection, which it now has under the above Chandler Act amendment, in all other fields of reorganizations. Thus the Treasury should endorse my recommendation. Without this protection for the Government, we could have done what hundreds of other groups of holders of defaulted bonds may yet do to minimize their taxes, that is, we could have bid approximately $4,000,000 for this property and have paid the bid price in defaulted bonds. In this manner we should clearly have obtained a basis for depreciation, subsequent sale, invested capital, etc., equal to the amount bid.

The Bankruptcy Act expressly excludes insurance companies, banks, building and loan companies, and municipal corporations from taking advantage of a reorganization under its provisions. Thus those businesses are treated most inequitably. No sound reason appears why reorganizations, no matter in what manner effected, whether through bankruptcy or otherwise, should not all have the same tax result. No preferential treatment should be granted to a corporation which happens to be so organized that it can avail itself of the bankruptcy procedure. Insurance companies should not be discriminated against merely because they cannot reorganize under the Chandler Act.

In short, I urge that section 112 (g) (1) of the Internal Revenue Code, which now defines a tax-free reorganization, be amplified, so that a transfer of substantially all the property of one corporation to another corporation by any judicial sale will be included. This will also require an amendment to section 113 (a) (7) so as to conform it to the amendment to section 112 (g) (1).

Now, however, the Commissioner of Internal Revenue contends in our case and in hundreds of other cases that the above reorganization plan did not provide for a tax-free reorganization under section 112 of the Internal Revenue Code and, hence, that Fifty West Broad, Inc., does not have for the purpose of depreciation the basis of its predecessor insurance company, as defined in section 113.

The Commissioner demands that the foreclosure sale price limits our basis for depreciation. This would wholly destroy our invested capital, leaving no credit against the excess-profits tax. The Commissioner has made a similar demand upon hundreds of other corporations resulting from comparable reorganizations. This demand is so extreme as to be almost absurd, because a 46-story building which cost in 1927 approximately $8,000,000, exclusive of the land, when the land itself was valued at $1,000,000 additional, is now to be limited for depreciation purposes to a foreclosure sale price or upset price of merely $1,650,000—less than 20 percent of the original cost of the land and building.

In computing the annual depreciation, the value of the land must be deducted, according to the demands of the Commissioner, from the foreclosure sale price of $1, 650,000, which leaves a relatively insignificant amount as a basis for depreciation.

We have attached to this statement as an exhibit a computation showing the hardship upon the large class of taxpayers to which Fifty West Broad, Inc., belongs under the income-tax law, which would result from obedience to the Commissioner's demands that invested capital be limited by the foreclosure sale price.

Congress has enacted from time to time during the past many years laws to prevent unfair competition. Yet by omitting from the present excess profits tax laws any provision by which the Commissioner may grant relief from abnormalities in invested capital, it is causing all corporations resulting from reorganizations to engage in competition on an extremely unfair and prejudicial basis with their competitors which have not been required to reorganize. By reorganizing and scaling down its mortgage debt and its interest rate thereon, the insurance company in the instant case planned to place its building upon a sound financial footing, but if the Commissioner's demands are not to be modified by the revenue law to be enacted this summer, this reorganization has in reality handicapped the insurance company, its policyholders, and its bondholders because it would have been much better to have had the company remain in receivership. Under receivership it would have had an invested capital based upon the cost of the building and land and an annual depreciation deduction from taxable income based upon the cost of the building, instead of one-fifth of that cost, which is the foreclosure sale price that has no relation to sound value whatsoever. Reorganized corporations should be permitted to pay taxes on the same basis as their competitors. This cannot be achieved if an upset price at a foreclosure sale is to determine the basis for depreciation or invested capital.

If no relief is to be granted by the new revenue law, this company may have to reorganize again by having the mortgage securing its present outstanding bonds foreclosed and bidding in the property through a new corporation to be created for that purpose, not at a nominal upset price, but at its sound value, making payment therefor in bonds presently outstanding of Fifty West Broad, Inc. In that manner it can increase its invested capital and secure a fairer basis for depreciation.

The reason why the tax amendment I advocate is more practical than the remedy given by the Chandler Act amendment of last summer is emphasized by the following considerations: Fair market value is no criterion for the basis for depreciation of the transferee corporation—in our situation, Fifty West Broad, Inc. Hardly ever is there any comparable property which will be of any assistance to the Commissioner of Internal Revenue in determining the fair market value of the taxpayer's property. Forty-six-story office buildings, such as ours, are not sold once in a quarter of a century to establish a fair market value. There is only one such building in the city of Columbus, so there can be no fair market value determined by examining the sale price of another such property.

It has been suggested above that the transferee corporation should have as a basis the sound value of the building, but not less than 50 percent of its predecessor's basis. The 50-percent rule has been applied to the individual bondholder under revenue acts for the last several years. This is found in the capital gain and loss provisions of the revenue laws where it is provided that bonds or other securities held for 2 years or longer, when sold or exchanged, result in taxable gain or loss only to the extent of 50 percent of the actual gain or loss. Thus, the 50-percent rule might now be extended to the corporations themselves in taxable reorganizations.

EXHIBIT A.—*Typical reorganization through judicial sale*

	Before reorganization (predecessor) (1)	After reorganization (nontaxable) (2)	After reorganization (judicial sale price) (3)	After reorganization (taxable) (sound reproduction value) (4)
Basis of building:				
Cost price (predecessor)	$8,000,000	$8,000,000		
Judicial sales price			$1,650,000	
Sound reproduction value				$1,500,000
Bonds outstanding:				
6 percent	3,500,000			
4 percent [1]		2,600,000	2,600,000	2,600,000
Income before interest and depreciation	250,000	250,000	250,000	250,000
Interest:				
6 percent	210,000			
4 percent [1]		104,000	104,000	104,000
Depreciation: 2 percent	160,000	160,000	33,000	90,000
Total interest and depreciation	370,000	264,000	137,000	194,000
Taxable income			113,000	56,000
Loss	120,000	14,000		

[1] Bondholders receive new bonds and stock.

Comment: Columns (2) and (3) of the above table illustrate the widely varying results under the technical provisions for the basis of property after a reorganization through judicial sale. Column (4) represents the application of our proposal for the correction of these inequalities.

EXHIBIT B.—*Taxable income from a reorganization under the bankruptcy law as amended in July, 1940. This amendment was sponsored by the Treasury Department*

Basis of building; fair market value	$4,000,000
Bonds outstanding, 4 percent	2,600,000
Income, before interest and depreciation	250,000
Interest, 4 percent	104,000
Depreciation, 2 percent	80,000
Total, interest and depreciation	184,000
Taxable income	[1] 66,000

[1] This resultant taxable income from a reorganization effected under the present bankruptcy law should be contrasted with a taxable income of $113,000, resulting from the same reorganization through the procedure under any judicial sale (see col. 3, exhibit A) other than a bankruptcy sale. This grossly inequitable result should be corrected by an amendment immediately in the manner presented in the statement of Hugh M. Bennett, in behalf of the superintendent of insurance of Ohio.

The CHAIRMAN. Mr. Milton Diamond.

STATEMENT OF MILTON DIAMOND, REPRESENTING DECCA RECORDS, INC., NEW YORK, N. Y.

The CHAIRMAN. Mr. Diamond, will you give your name, please, sir, and address?

Mr. DIAMOND. My name is Milton Diamond. 598 Madison Avenue, New York. I represent Decca Records, Inc.

I have prepared, Mr. Chairman, a statement that I would respectfully ask to be included in the record, and which I would also like to pass around, if I may.

The CHAIRMAN. Yes; you may do so. You appear with reference to a particular thing in the tax bill, Mr. Diamond?

Mr. DIAMOND. I do. I appear to urge the elimination of the proposed levy of 10 percent on phonograph records.

Senator CONNALLY. All of them, or just some kind of records?

Mr. DIAMOND. All of the phonograph records.

Senator CONNALLY. Oh, yes.

Mr. DIAMOND. The company I represent is one of the three major companies engaged in the recording and manufacture of phonograph records. I assume it is pertinent to examine the extent by which the proposed tax levy may be affected by a consideration of the item to which I am addressing myself.

The Treasury's schedule of anticipated revenue refers to the item of phonograph records and phonographs together and indicates a possible yield of $4,500,000 from that source on the basis of a 10-percent levy on the manufacturer's cost. I am not addressing myself to the subject of phonographs at all, I appear only in relation to phonograph records, and it is our estimate that the maximum yield from that source as distinguished from the combined items of phonographs and phonograph records would not exceed $1,500,000.

At this point, it might be important to refer briefly to some of the history of the phonograph-record business. In 1929 that industry reached a high level of well over 100,000,000 units which were sold in the American market. By 1933—and I say this unaccusingly—as the result of a combination of circumstances the total units that were distributed in the United States had been reduced to something around 12,000,000. In the following year a supreme effort was made to restore public interest in phonograph records, and the device was resorted to of offering to the public records at a retail price of 35 cents as distinguished from the evailing price for comparable records up to that time of 75 cents. The public indicated a renewed interest in phonograph records in that year and in succeeding years. We found, however, that it was not possible to operate profitably and continue to market records at that price in the light of an excise tax of 5 percent to which we were then subject and which was absorbed by the manufacturers. The margin of profit on a 35-cent record which sells to dealers for 21 cents is not very great, as you might very well imagine, and absorbing the 5 percent excise tax we found there was no possibility for continuing gainfully in the conduct of that business.

So, we addressed ourselves to the Congress, and in 1937 we made representations urging the repeal of the excise tax. In doing so, we called attention to, first, the fact that a phonograph record had a useful purpose as a cultural medium, and, secondly, that the tax yield was nominal and perhaps did not represent as much as it cost the Government to collect it.

For example, in 1936, the tax yield from the entire phonograph-record industry was $290,000, and in 1937 it reached $325,000.

Also we made some promises and predictions when addressing ourselves to the Congress in an effort to remove that tax. We said if that tax were removed the industry would really prosper, that it would continue in its effort at revival, that the phonograph record was an important part of the cultural life of the community, that it would result in increased employment and in increased taxes to be paid by the manufacturers, by the artists who were employed by the manufacturers, by the suppliers of materials, and others.

Congress gave sympathetic consideration, and effective as of June 1938, the tax was removed, and since that time there have been rather important developments in that little industry of which we have the honor to be a part.

For example, in the year 1938 the company which I represent paid out in salaries $673,000; in 1940 it paid out in salaries over $1,235,000. In 1938 we employed 614 people, and in 1940, 2 years after the removal of the tax, the number of employees almost doubled. In 1940, this company paid in direct taxes $186,000, as compared with $78,000 which it paid in the year during which the tax was removed. We think 1941 will be an even more important year.

Senator VANDENBERG. Why would the removal of the tax be responsible for the increase if you absorb the tax?

Mr. DIAMOND. We were not able to carry on our business profitably until that tax was removed. It was not until 1938 that the tax was removed.

Senator VANDENBERG. I understand that.

Mr. DIAMOND. When the tax was removed it became possible for us to expand to the point where we could employ additional capital and additional labor and additional artists and additional suppliers of materials, bringing about this increased consumption of our material by the public.

Senator VANDENBERG. It was not the wholesale price of the record to the public?

Mr. DIAMOND. Well, the price of the record to the public is what reawakened the interest in the records on the part of the public. We could not carry on the business and maintain that price and absorb the tax at the same time. That is why we applied for the removal of the tax, and when our efforts became successful and the tax was removed, it was possible for us to expand.

Senator DANAHER. What were your gross sales for the period in which you had $1,253,000-plus of salaries?

Mr. DIAMOND. Our gross sales in 1940 were under $6,000,000.

The CHAIRMAN. Mr. Diamond, what is the average price of your record, the manufacturer's price, I mean, the wholesale price?

Mr. DIAMOND. The wholesale price of more than two-thirds of the product that we sell is 21 cents. The manufacturer's cost is less than that, of course, but the price which dealers pay is 21 cents. That is the wholesale price for the 35-cent record.

The CHAIRMAN. The tax is on the wholesale price?

Mr. DIAMOND. The tax is on the manufacturer's cost. It would be somewhere between 1½ to 2 cents.

The CHAIRMAN. On each record?

Mr. DIAMOND. On each record.

The CHAIRMAN. Or is that the average?

Mr. DIAMOND. On each of the 35-cent records.

The CHAIRMAN. That is about two-thirds of the business?

Mr. DIAMOND. That is about two-thirds of the business. On the basis of the 1940 figures, had there been an excise tax the tax collectible on the 35-cent records would not have been greater than $600,000.

Now, we say that we have passed through these vicissitudes, that we have rendered and are rendering an important service, that the phonograph record has definite value, as a cultural medium, and that it would be unprofitable to take the hazard of reimposing a tax which

Congress, upon a complete understanding of all the circumstances, removed only a few years ago, and then perhaps bring this industry back to the condition in which it was in 1938 before Congress had removed the tax.

The CHAIRMAN. Did you enter into this recommendation, do you recall, by the manufacturer of the records with the defense people? Did the defense commission or the defense people make any suggestion that this was a necessary defense material?

Mr. DIAMOND. No such suggestion has been made, Mr. Chairman.

The CHAIRMAN. That does not enter into it?

Mr. DIAMOND. That does not enter into it, because the amount of metal used is so small, and the importance of the phonograph record in connection with defense work is appreciable, because there is no camp without phonograph records. One of the first items that was acquired by those in charge of operating the camps for the entertainment and edification of our young men in the camps was the phonograph record, and there has been no suggestion that we are not entitled to continue to use the small amount of metal that we do use in the processing of the masters.

The CHAIRMAN. I was making inquiries because I was not familiar with it. I did not know whether they did include you in the recommendation that they submitted to the Ways and Means Committee of the House.

Mr. DIAMOND. If that has been done, I am not aware of it. My information is it has not been done.

The CHAIRMAN. Is there any further statement you wish to make?

Mr. DIAMOND. That is all I would like to say at this time, except I would like to ask that my statement be incorporated and made a part of the record.

The CHAIRMAN. You may leave it with the reporter.

(The statement referred to is as follows:)

MEMORANDUM IN OPPOSITION TO PROPOSED MANUFACTURERS' EXCISE TAX ON PHONOGRAPH RECORDS

FACTS

Decca Records, Inc., advocating the repeal of the 5-percent excise tax on phonograph records imposed by section 607 of the Revenue Act of 1932, stated in 1936 and 1937 that the elimination of this levy—

(1) Would increase employment in the industry;
(2) Would increase the taxable income of and create new taxpayers among its employees;
(3) Would bring into existence large taxable incomes of record manufacturers subject to excess-profits taxes and taxes on corporate accumulations; and
(4) Would generally contribute to the economic recovery of the Nation.

The tax was repealed in 1938. These promised benefits occurred and, indeed, exceeded the expectations of the advocates of repeal. Now, the threatened reimposition of an excise tax on phonograph records—at the rate of 10 percent as contrasted with the former 5 percent—spells the doom of these gains and jeopardizes, once again, the existence of the phonograph record industry.

ARGUMENT

Decca Records, Inc., respectfully submits this memorandum in which it will demonstrate that—

(1) The proposed levy will be an ineffective revenue-raising device;
(2) To reimpose this tax so recently abolished will be to reverse the general tax policy of unburdening media for the dissemination of culture and education;
(3) The recreation of this levy will be in total disregard of the proved benefits derived from its recent repeal; and
(4) In any event, the proposed levy should not apply to inexpensive records.

POINT I.—*The proposed manufacturers' excise tax on phonograph records will be an ineffective revenue-raising device*

In 1936 that part of section 607 of the 1932 Revenue Act applying to phonograph records yielded the Government the approximate sum of $290,000. In 1937, the return from the excise levy was about $325,000. This infinitesimal revenue was further diminished by administrative expenses necessitated in the collection thereof. For these reasons it was foreseen that the small amount of revenue derivable from the levy on phonograph records would more than be offset by liberating the industry from its burden. That foresight should be applied again today.

Although exact statistics are not available, it is liberally estimated that no more than $2,000,000 would be currently forthcoming in the current year from the proposed 10-percent excise levy. This sum is based on sales of all types of records. But this figure presupposes that the industry can continue on its present basis. The imposition of this tax will reduce by more than two-thirds the profit on records produced to sell at a retail price of 35 cents. It will also be shown that this decrease when added to the inroads presently being made by higher production costs will all but erase any possible profit. Record production will radically decrease and, with this curtailment, expected revenues from the proposed excise tax will vanish. At the same time the rapid trend of reemployment in the industry and the creation and augmentation of taxable income of employees will be radically reversed. Consequently, the revenue realized from the industry from all forms of levy will be greatly if not entirely curtailed.

POINT II.—*The manufacturers' excise tax on phonograph records is completely inconsistent with the general tax policy of the United States since it burdens an important means of disseminating culture and education*

Formulation of this Nation's tax program has always aimed at avoiding undue burdens upon educational and cultural media. The revenue acts have specifically allowed deductions from gross income of contributions to educational institutions (I. R. C., secs 23 (o), 23 (q), and 162 (a)) among which are included associations sponsoring classical concerts (1 C. B, 147-8). Such associations themselves are exempt from income taxation (I. R. C., sec. 101 (6)). Admissions tax provisions specifically exempt performances of symphony societies and concerts given by civic membership associations (I. R. C., sec. 1701 (a) and (c)). The Tariff Act of 1930 does not apply to certain books, paintings, and works of art (19 U. S. C. A. 1201, pars. 1628, 1630, 1631, 1807-1812). Libraries are accorded reduced postal rates (39 U. S. C. A. sec. 293 (a)). These examples taken at random clearly demonstrate the aim and desire of the Government to foster and not to burden culture and education.

Any proposed special taxation on phonograph records should be considered in the light of this long-established policy. They are a significant and ever-increasing medium for the dissemination of education and culture. The uses of phonograph records have become manifold. The blind may read, children may hear the songs and stories which are their social and cultural heritage; diction, phonetics and foreign languages may be taught in a manner not attainable from the printed page; the voices of historic characters and occurrences of world-shaping events may be preserved for posterity; the instant of dramatic creation of a Barrymore or Cornell may be relived in the future.

And the musical value of records is even more transcendent. Musical study relies on recourse to phonograph records. The monophonous beginnings of modern music may be traced; the primitive chants of the American Indian, the Chinese, and the Hindu are preserved. Caruso and Chaliapin still sing. Musical appreciation courses rely almost entirely on recordings. Full instructions for

listening to symphonic works have been recorded by such internationally known artists as Walter Damrosch and Leopold Stokowski. The music and folk songs of Latin America are brought to all sections of the American public. And after love of music has been instilled, it is obviously nurtured most economically and conveniently by recordings, since only a few of the population of this country find concerts readily available. Records are no longer luxuries. They are necessities, and their production should be encouraged.

Taxation of records therefore is taxation of American culture and education. This misapplied and unproductive levy was recently removed. To restore it is to negate the intelligent, progressive, and liberal consideration of this question so recently adopted by the Congress.

POINT III.—*Elimination in 1938 of the 5 percent excise tax on phonograph records has been attended by a sharp increase in employment and taxes paid by phonograph record manufacturers*

The Revenue Act of 1938 eliminated the 5-percent excise tax on phonograph records imposed by section 607 of the 1932 law. This tax had been placed on the books in 1932 without debate and with little consideration of its basis or effect. (See Cong. Rec., March 29, 1932, p. 7037.) It administered what almost amounted to the final blow to an industry already prostrate from the catastrophic competition of radio broadcasting. In 1921 the manufacturers' value of phonograph records sold exceeded $47,000,000. In 1933, the total volume of business barely reached $2,500,000. And, few crumbs from the replenishing table of national recovery fell to this industry. In 1935, the value of record sales rose to $3,700,000; in 1937 disk record sales were valued at $4,750,000. Following is a table of phonograph record sales from 1921 to 1937 prepared biennially by the Bureau of Foreign and Domestic Commerce of the Department of Commerce:

Year	Disk records		Cylinder records and blanks	
	Number	Value	Number	Value
1921	103,436,710	$47,322,954	1,755,219	$520,902
1923	92,855,073	35,714,194	5,249,206	658,216
1925	(1)	(1)	82,125,060	[2] 26,790,847
1927	104,766,228	31,486,279	935,074	295,164
1929	105,085,042	[3] 34,128,735	(4)	(4)
1931	30,851,282	[5] 7,697,787	(3)	(3)
1933	(4)	[6] 2,500,477	(3)	(3)
1935	(4)	[6] 3,705,016	(3)	(3)
1937	(4)	[6] 4,755,877	(4)	1,267,986
1937	(4)	[7] 1,613,530		
1937	(4)	[7] 185,799		

[1] Disk, cylinder, and blank records combined in order to avoid disclosing data for individual establishments.
[2] Disk records only.
[3] Blank cylinder records not reported but included in "Other products of the industry."
[4] Not reported.
[5] Includes both disk and electrical transcriptions.
[6] Electrical transcriptions only.
[7] Other records.

In 1938 when the excise levy was eliminated, Decca Records, Inc. foresaw the immediate benefits which would result from the abolition of this tax. In advocating the abolition of the levy, it promised that relief from the tax would result in an increase of its employees, the creation of new income taxpayers and the increase of the taxable income of record producers. This pledge has been more than fulfilled. Following is a table showing the salaries paid to employees, the number of persons employed and the taxes paid by Decca Records, Inc. ever increasing in the years 1938, 1939, and 1940:

Year	Salaries paid	Number of employees (approximate average)	Taxes paid (all levies, State and Federal except social security taxes)
1938	$673,669.92	614	$78,434.91
1939	1,073,202.25	936	138,506.88
1940	1,253,597.18	1,067	186,195.99

Thus, in the year following the abolition of the excise levy, 1939, the number of Decca's employees increased over 50 percent; in 1940 the increase was almost 100 percent over 1938. Salaries paid followed a similar pattern of increase. Taxes paid rose accordingly. Generally, in 1939 the value of disk records sold in the entire industry had risen to $15,980,130. Obviously, the benefits derived from the abolition of the excise levy more than compensated the Federal Government for the relinquishment of the inconsequential revenue it had formerly derived from this source. And, what is most important, the benefits were directly passed on to working men and women who became taxpayers, to recording artists whose augmented incomes placed them in the surtax brackets, and generally to the public. This situation found its counterpart in other major phonograph record manufacturers.

It can definitely be said that the elimination of the excise tax substantially if not entirely contributed to this rise in the Decca figures. For, Decca operates on an extremely close margin. The preponderant bulk of its records retail for 35 cents. Decca's billing price to its distributing company is less than one-half of the retail price. A minute margin of profit, obviously irreducible, is thus presently maintained.

The 1932, 5 percent excise levy discouraged production and jeopardized the realization of profit. The currently proposed 10 percent excise levy would amount to more than two-thirds of this margin of profit. And this inroad into net receipts is not the only one currently threatened. The cost of all supplies is skyrocketing. For example, shellac, the basic ingredient from which records are pressed has recently increased in cost by 80 percent. Other ingredients have also risen in price. And a substantial increase in wages has also been entirely absorbed. Obviously, the small profit would be almost entirely eliminated by the reimposition of this proposed excise levy. The industry will fall back into the doldrums.

Nor can this proposed tax be passed on to the public by Decca. Until Decca's advent into the recording field, records similar to its 35-cent type were sold at a retail price of 75 cents, although many previous but unsuccessful essays had been made into the lower priced field. The successful production and marketing of the 35-cent record has been almost entirely responsible for the revitalization of the industry. It is estimated that one-half of all phonograph records sold annually in the United States are of the 35-cent class, although the higher priced records account for two-thirds of the revenue received by record manufacturers. Obviously, the 35-cent record is purchased by those of the music-loving public who cannot afford the higher priced records.

It is therefore respectfully urged that the proposed reimposition of an excise levy on phonograph records will be unproductive of revenue, will be a reversal of long established and carefully considered policy against burdening media for the dissemination of culture, and will be in direct disregard of the benefits derived from recent abolition of a similar levy. Consequently, this tax should not be reimposed upon phonograph records.

POINT IV.—*In any event, phonograph records retailing at 35 cents or less should be exempted from any excise tax*

What has been said above represents our considered view as to the advisability of not again placing a crushing excise tax on the now revitalized phonograph record industry. However, we recognize that there will be those who will say that no industry should be entirely exempted from the burden of national defense, and that some tax should be paid by the record industry. For the reasons set forth in this memorandum, we believe such an argument to be fallacious but if despite this the Congress should feel that some part of the load must be borne by the phonograph record industry, then it is submitted the committee recognize the principle that those who are best able to pay should do so. We therefore respectfully urge that the law exempt from the burden of the tax records made to retail at 35 cents or less.

As has been demonstrated, these records are marketed by manufacturers at a price which keeps profits at the bare minimum. They are the records to which the poor man turns for his entertainment. These records are marketed at a price which is so close to cost as to render the manufacturer's excise tax the difference between a possible profit and a certain loss. In the 75-cent field, yes, even in the 50-cent field, there may be some slack and consequent ability to absorb additional tax; but not so in the 35-cent field. Material, labor, advertising, talent, packing and shipping costs, plant overhead—all these items and others enter into a 35-cent record almost to the same extent as in a 50-cent, a 75-cent, or a $1 record;

but the return to the manufacturer is substantially less. Thus, while the 35-cent record hovers just above the subsistence level, the higher priced record enjoys a margin of profit which secures its existence. We ask the committee to recognize this problem and, if there must be a new tax placed upon the industry, to place it where it can best be borne—on the more expensive record.

Nor will the application of this exemption result in any material curtailment in revenue. The 35-cent record accounts for but one-third of the total income of the industry. In 1940, the total value of 35-cent records subject to the proposed levy would have been approximately $6,000,000. The total tax derivable therefrom would have been $600,000. Yet, the injury resulting from such levy would be profound and immeasurable.

This principle of exemption at the lower end of the scale has repeatedly found recognition in other taxing statutes. Admissions taxes begin at 20 cents (I. R. C., sec. 1700 (a)); even the proposed amended statute would exempt admissions under 10 cents (press releases of April 23, 1941). Admissions to roof gardens, cabarets, and the like are exempt from tax when they fall below 51 cents (I. R. C., sec. 1700 (c)). The New York City sales tax applies only to purchases over 12 cents (regulations under Local Law No. 21 of 1938, art. 4); and on food served in restaurants it attaches only when the price of the meal is $1 or over (regulations under Local Law No. 21 of 1938, art. 57). Incomes in the lower brackets are exempt from surtax (I. R. C., sec. 12), and personal exemptions plus an earned income credit are allowed (I. R. C., sec. 25). Telephone calls costing less than 50 cents are tax free (I. R. C., sec. 3465). The statute provides exemptions for annual dues under $25, and for initiation fees less than $10 (I. R. C., sec. 1710 (a)).

The same principle may be found in various former excise-tax laws. For example, the tax on furs from 1934 to 1936 did not apply to fur articles where the sale was in an amount less than $75 (sec. 604 of the Revenue Act of 1932, as amended). The excise tax on jewelry originally provided an exemption only for watch parts costing less than 10 cents (sec. 605 of the Revenue Act of 1932). In 1934, the same tax rate was maintained, but an exemption was introduced for all articles of jewelry under $3 in price. Later in the same year, the act was again amended to provide an exemption for all sales of jewelry under $25 (sec. 609 of the Revenue Act of 1934); and this exemption was continued with the tax at the same rate until it was terminated in 1936 (sec. 809 of the Revenue Act of 1936). An analogous situation is found in the excise tax on toilet preparations. Although no exemption has been declared on the price of an article, mouth washes, dentifrices, and toilet soaps were exempted from the operation of the tax in 1938 (sec. 701 (a) of the Revenue Act of 1938).

It thus appears that the problem of necessity as against luxury has been in the minds of the legislators who have drafted our tax statutes in the past. Significant are the exemptions in the former jewelry tax, which seems to recognize the fact that the meanest of us might have an inexpensive watch or some article of personal adornment, and the similar exemption in the fur tax. So, those toilet preparations which are used by practically the entire population of the country have been exempted from the excise tax. Not only the problem of the manufacturer in bearing the proposed tax of 10 percent on a phonograph record which is made to retail at 35 cents or less and marketed at a wholesale price which produces an extremely low margin of profit, but also the problem of the consuming public which has come to depend upon this low-priced record as a part of normal living, demands consideration at this time. The problem has been recognized in the other taxes discussed above. We believe that the position of the producer and consumer of the phonograph record in the lowest price bracket falls into the same category.

Respectfully submitted.

MILTON DIAMOND,
Attorney for Decca Records, Inc.,
New York, N. Y.

Senator VANDENBERG. How many records are still sold at the higher cost, more than 35 cents?

Mr. DIAMOND. As of 1940, I think that about 15 or 18 million records were sold in this country at the higher price. I do make the suggestion in concluding my memorandum that, if a tax in the form of an excise tax be made on records, that it apply to records that retail for more than 35 cents because there is a possibility for a greater profit margin. It may very well be that the manufacturers would

be able to afford that tax on the higher-priced records; there is no possibility of the tax being absorbed on the 35-cent records.

Senator VANDENBERG. What is the comparison in dollar value of the sales at 35 cents and over 35 cents? Do you have that?

Mr. DIAMOND. Yes; I think I have it here. I think in dollar value, the records that are sold at more than 35 cents would represent over 50 percent of the gross revenue of the industry, despite the fact that the unit value of 35 cents would number about two-thirds of the records sold by the industry.

Senator VANDENBERG. And the gross revenue of the industry in 1939 was about $16,000,000?

Senator TAFT. Have you found that the imposition of a sales tax in the State of Ohio has retarded the sale of records?

Mr. DIAMOND. We found that the State of Ohio was about as well off as other States in responding to the efforts to revive the industry.

Senator TAFT. Well, we have a sales tax in Ohio, 36 cents for a 35-cent record, which tax has to be passed on. I wondered whether that deterred the sales?

Mr. DIAMOND. I am afraid I am not able to answer as to the effect of that on sales for that State in relation to States of comparable population and purchasing power.

Senator TAFT. I have heard no complaint of the Ohio sales tax, and New York also carries such a sales tax, does it not?

Mr. DIAMOND. Yes.

Senator DANAHER. Has there been any shortage of the shellac from which you make the records?

Mr. DIAMOND. Well, it comes from India. We have all tried to provide in advance for the supply of it, but we have also carried on considerable research to produce a material which will enable us to reduce the shellac content of the record without impairing, in any way, its quality. We have been successful, in the main, to the point where I don't think we shall ever feel the need of shellac in the event there is any difficulty in continuing its importation.

Senator DANAHER. It has about doubled in price this year, hasn't it?

Mr. DIAMOND. Yes; and labor has increased, and all other materials have increased in price. All of that we have been able to absorb and I believe, are prepared to continue to absorb, but obviously an excise tax of anywhere from 1½ to 2 cents per record would completely wipe out the spread between the cost and sales price of the manufacturer.

Senator DANAHER. You would just have to fold up?

The CHAIRMAN. Is rubber used in the manufacture?

Mr. DIAMOND. No; we use a carbon black.

The CHAIRMAN. You don't use rubber?

Mr. DIAMOND. No.

The CHAIRMAN. Very well.

Mr. George A. Hughes; you are appearing for the Edison General Electric Appliance Co.?

Mr. HUGHES. Yes.

The CHAIRMAN. On electrical appliances?

Mr. HUGHES. Yes. I have been asked to represent the electrical range and electric water heater manufacturers. If you will bear with me, I will be just as brief as I possibly can. It will take me about 15 minutes, I think, to go over this.

STATEMENT OF GEORGE A. HUGHES, CHICAGO, ILL., CHAIRMAN, EDISON GENERAL ELECTRIC APPLIANCE CO.

Mr. HUGHES. Gentlemen, the need for additional revenue is not questioned, and we do not oppose taxation on our product. I am sure it is your wish that whatever program is adopted for raising this revenue will be consistent with the public welfare, and as free as possible from discrimination. May I direct your attention to that section of the bill before you, where it seems to us that a discriminatory tax has been proposed?

I refer specifically to section 552, "New Manufacturers Excise Tax," subchapter A of chapter 29, section 3406, item 3, reading as follows:

Electric appliances.—Electric motor-driven fans and air circulators; electric storage water heaters; electric flatirons; electric air heaters (not including furnaces); electric immersion heaters; electric heating pads and blankets; electric appliances of the type used for cooking, warming or keeping warm food or beverages for consumption on the premises; electric mixers, whippers and juicers, and household type electric vacuum cleaners, 10 per centum.

It may be that electrical appliances are viewed as luxuries by some, because of their advantages in use-value over old-style devices, and it is perfectly natural that the draftsmen of this bill should have included, without realizing it, some items of electrical equipment which are not luxuries, but necessities. Gentlemen, an electric stove is a necessity—not a luxury. It is necessary as the food that is cooked on it. This view is held by many builders of low-cost housing projects, where large numbers of electric ranges have been installed.

My belief that electric cook stoves were unintentionally included in the bill is supported by the fact that the Ways and Means Committee included the housewife's friend, the washing machine, in their original bill, but later eliminated this device. I am further encouraged to believe that the tax on electric cook stoves was not intended, because another department of the Government, the Office of Civilian Supply, is dealing with the stove industry as a whole.

Senator VANDENBERG. Do I understand you are not complaining of the tax against any of the other electrical appliances?

Mr. HUGHES. I am not complaining against this tax except that it discriminates against our industry.

Senator VANDENBERG. How much is involved in the tax just on electric stoves?

Mr. HUGHES. About 13 percent of the total; I have the figures, I will read them.

May I ask, therefore, is it the intention, gentlemen, to put a tax on the cook stove? If so, then it is only fair to put a tax on all cook stoves, just as the bill does in taxing all mechanical refrigerators, electric, gas, or any other kind, without discrimination.

If it is not intended to tax cook stoves, then the clause to which I refer, on page 73 of the amendments to the bill introduced under Report 1040, lines 9, 10, and 11 should be changed to read as follows:

Electric table appliances of the type used for household cooking, warming or keeping warm food or beverages for consumption on the premises.

This change in the wording would obviously exclude cook stoves.

However, gentlemen, if, in your minds, the emergency requires taxation of the family cook stove, may I suggest these facts for your consideration? The 1939 census value of all cook stoves produced

was approximately $124,000,000. This does not include the value of high-pressure cylinders on customers' premises necessary where bottled gas is used. From the best figures available, we estimate that the value of all cook stoves produced in 1940 amounted to approximately $161,000,000. The value of electric cook stoves amounted to only 13 percent of this total. It is obvious that as a tax-revenue producing item, the electric cook stoves by themselves, are relatively unimportant.

Would it not be wiser to consider a smaller tax on the entire cook stove industry? For example, a 1¼-percent tax on all cook stoves would raise as much revenue as you would get from a 10-percent tax on electric cook stoves alone; a 2½-percent tax on all cook stoves would yield twice as much, and on on. The revenue thus obtained would be a very substantial sum, but the smaller tax would be much less burdensome.

May I elaborate a little on this matter of discrimination? Gentlemen, there are 8½ million homes wired for electricity which do not have city gas. There are 7 States that have more electric ranges in use than gas ranges. The population of these States live in small cities and villages, many of which enjoy low-cost hydroelectric power. They are not industrial States. In addition, there are 8 States in which electric and gas ranges are almost equal in number. For example, Senator George, your own State of Georgia is among these 15. What would the people of Georgia think if their electric ranges were singled out for taxation as luxuries? In your town of Vienna, they do not have city gas, and yet it costs only $2 a month on the average to cook electrically. Three of you gentlemen come from cities which have no city gas. The average costs to use electric cook stoves vary from about $1 to $3.25, while the average cost to cook by gas varies from 90 cents to $3.50 a month, in the 20 cities where you have residences, as shown by the table which I will leave with you. Should the people in these small cities and villages be discriminated against?

One-third of the farms of this country are already electrified, and many of these farmers are buying electric ranges. Should they be discriminated against? Should the entire Rural Electrification program be handicapped by a discriminatory tax? It is the working people of the country, on the farms and in the towns, who buy electric ranges. Should they be discriminated against?

Aside from the unfairness of this proposed discrimination, let me point out that this is no time to discourage the use of electric cooking. I realize that this committee cannot take time to listen to a eulogy of our product, but in this time of national emergency, a cooking device which enables the housewife to save time and labor, conserve the vitamins and minerals in food, which is safe, clean, and economical, is an article to be appreciated and encouraged. In addition to its contribution to the health and welfare of its users, the electric range has advantages from the standpoint of national defense. By weight, electric ranges use less iron and steel. Even though oil stoves are lighter in structure, they require heavy fuel containers. In the United States Navy, where minimum weight, maximum efficiency and safety are really vital, electric cooking equipment is used 100 percent.

In that connection, I might say that my company alone has already eliminated 1,250,000 pounds of aluminum. We use no aluminum

now; we do use 40 cents less of nickel on a $140 article; we cannot get away from that.

Senator VANDENBERG. In your statement to Senator George, "What would the people of Georgia think if their electric ranges were singled out for taxation as luxuries?" this tax would not apply to any range now owned in the State of Georgia, would it?

Mr. HUGHES. No, sir; it would have to be sold in the future, but there is a large market there that is not yet filled.

Senator VANDENBERG. I just wanted Senator George to have an answer to send down.

The CHAIRMAN. If they traded in the old one and got a new one, there would be a tax.

Mr. HUGHES. Electric ranges tend to conserve transportation facilities. It is estimated that 40 percent of the ranges in use are served by electricity produced from water power. They eliminate the transportation of fuel to service them. I have pointed out that the majority of electric ranges have not gone into industrial areas. We hear estimates of oil shortages mainly because of the transportation problem; coal and other fuels must be transported also.

May I also direct your attention to the similar discrimination proposed against electric cooking for commercial and industrial uses? If it is the intention to include all electric cooking and baking equipment under the proposed excise tax, then I think you will agree that the tax should also be placed on corresponding nonelectric cooking and baking equipment.

Following that is a statement from your home towns of what it costs for all of this and the next sheet contains a census of manufacturers so you can see what the situation was in 1939.

Following that is a list of 15 States where we have more, or almost as many, electric ranges as gas ranges, and the total number of customers. I would like to say just a word about the electric water heater.

I think you will find those figures interesting.

A brief has just been presented by us, asking that you free the family's electric cook stove from possible discriminatory taxation. For some reason, "electric storage water heaters" are specifically mentioned in the bill. Possibly this is because they so appeared in the Census of Manufactures under the heading "Electrical appliances."

As the proposed bill comes to you, section 3406, item 3, previously quoted, contains this specific reference. Possibly this is because some consider electric water heaters are luxuries and so these heaters are singled out without intentional discrimination.

Please understand me, I do not oppose taxing my company's products, nor those of the electrical industry, of which my company is a part. Gentlemen, I ask that, if it is necessary to produce revenue from taxing household hot water supply systems or appliances, then please apply the same percentage of tax to all kinds.

Electric water heaters, like stoves or furnaces, are part of the house we live in, and are no more a luxury device (except in the sense that they give superior service) than are other forms, commonplace or ingenious—such as solar systems made a part of the roof for heating water in Florida bungalows.

The Census of Manufactures for 1939 shows that the value of electric water heaters produced is only 13.7 percent of the total value

of all kinds of water heaters reported. Therefore, a discriminatory tax on electric heaters would provide the Government with only a little more than one-eighth of the total revenue available from an equal tax applied to all water heaters.

Storage electric water heaters are the most efficient form of heating water for the home, and are very economical. This is due to the fact that electric water heaters, generally apply the heat at 100 percent conversion of energy through heating units immersed in the water inside the tank. They enjoy extremely low-cost rates for the electricity they use, which use occurs largely during off-peak hours, much of it in the early morning. And by this same token, this technically perfected yet commonplace, package type of hot water supply system, least of all interferes with the other necessary demands for electricity. Their wide use has contributed in a substantial way to economically sound reduction of electric rates for all other electricity used in the home.

Many people in the low-income brackets are purchasing electric water heaters for their homes, and they boast of the low-operating cost.

With your permission, Senator George, I should like to use your home State of Georgia to illustrate again. In Georgia, the average monthly bill for approximately all of the electric water heaters in use is $2.30.

Senator GEORGE. I am afraid you have been writing my people because I have been hearing from them on this.

Mr. HUGHES. Well, Georgia happens to have one of the most progressive utility company users in the country.

Gentlemen, a supply of hot water for each family's welfare and health is necessary. There are 150 uses of hot water familiar to the homemaker—and only 3 uses for cold water, drinking, fire protection, and sewerage. Hot water is used every 20 minutes of the day in the home. Its use is even more needed on the farm, particularly the dairy farm.

The storage electric heater is probably the most economically desirable appliance which the farmer buys. Gentlemen, this will interest you—private and public power authorities can be said to agree on the economic necessity of the electric water heater and the electric cook stove to the successful completion of the electrification of our rural areas.

Over 15,000,000 wired homes in this country can have rates of 1.2 cents per kilowatt-hour for water heating. These contributions to public welfare should not be discriminated against.

In the brief on electric cook stoves, it was pointed out that there are 8½ million homes which have electricity but are without city gas. These would include, of course, the 2,000,000 electrified farms, a number rapidly increasing. Would you propose to penalize the people in these rural homes, as they mostly are, by taxing their electric water heater while the people in large cities could buy a water heater tax-free?

The cities have the choice—gas or electricity—but that doesn't apply to the farm.

Like the electric cook stove, electric water heaters conserve transportation of fuels and of materials by weight. It is estimated that a majority of the electric water heaters in use are served by electricity from water power, an energy conversion involving no solid, liquid, or

gaseous fuel. In comparing weights of materials, the necessary auxiliary equipment for storage of fuels in basements or back yards should be borne in mind.

This brief, considered in connection with electric cook stoves, provides ample information upon which your considered judgment will, I believe, free these necessary devices in the home from any discriminatory tax.

Senator TAFT. These figures are based on what?

Mr. HUGHES. That is the average rate of the homes in these communities.

Senator TAFT. Those figures are not taken from actual bills?

Mr. HUGHES. The average; yes.

Senator TAFT. Or, is it just arbitrarily calculated from what that much electricity would cost a certain number of users?

Mr. HUGHES. Let us say there are 250 homes and the bill is $1,000. We know the average would be $4. Of course the bill would vary very much but it does indicate an average.

Senator DANAHER. I have a question or two: These so-called manufacturers' excise taxes which include electrical appliances were inquired of by me the other day, when the Secretary was here, and he said some of them had been included on the ground they dealt with luxuries, and when I asked him if he considered a typewriter to be a luxury, he added a good many of the items had been included here because their manufacture would conflict with our defense.

Now what is there about an electric-stove that would conflict with our production for defense needs?

Mr. HUGHES. Well, it uses iron; about 40 cents worth of nickel, and that is about all. The water heater used iron too, but that is true of all our competitors. The only difference between the electric and gas range is that the gas range also uses a stainless steel ring which is half nickel, so they would all use some nickel.

Senator DANAHER. And iron; so that, if we are going to include that on the theory that its manufacture would conflict with production for defense needs, and you are going to try to discourage the manufacture of electric stoves entirely, then I should say we ought to increase the rate, too, shouldn't we? I mean, to be logical about this claim that this manufacture interferes with defense production, we should raise the rate?

Mr. HUGHES. You mean, it increases the use of the gas range also? We are not complaining about the fact of the tax; our complaint is the discriminatory nature of it.

Senator DANAHER. If we limit the tax to electric stoves, but really wish to discourage the manufacture of them, we should increase the rate on that item, should we not?

Mr. HUGHES. Well, I hope you won't.

The CHAIRMAN. I suppose the use of electric energy is one of the things the defense people might have had in mind, although you don't manufacture that and aren't concerned with it.

Mr. HUGHES. Yes; we are very greatly concerned with it. Our products go very largely in the rural areas, in the great waterpower section of the Northwest. For instance, in the State of Idaho, which is a waterpower State, we have 56 percent saturation on electric ranges and 35 percent saturation on electric water heaters. In other words, the farther west you go, the greater use of electricity is evident.

The CHAIRMAN. I suppose you have pretty rigid restrictions on nickel?

Mr. HUGHES. Yes; we manufacture practically all the equipment for the Army and Navy, practically every boat that is built today is so equipped. We have priorities on all that stuff, of course.

The CHAIRMAN. Any further questions?

Senator WALSH. Were these manufacturers given an opportunity to appear before the Ways and Means Committee with reference to these taxes?

The CHAIRMAN. I don't think so. You didn't appear before the Ways and Means Committee?

Mr. HUGHES. No, sir. I did not; I knew about the tax on some other things but I thought our industry was so small they would overlook us, but the first thing I know, it was in. That is the reason I am here.

(The Comparison of cooking stove and range values based on 1939 Census of Manufactures; Statement from your home towns relative to costs: Census of Manufactures, and list of 15 States giving comparison of electric ranges to gas ranges, referred to by Mr. Hughes, are as follows:)

Comparison of cooking stove and range values, based on 1939 Census of Manufactures

	Number	Value	Per unit value
Electric household ranges (2½ kilowatts and over)	237,128	$16,181,782	$68.24
Nonelectric stoves and ranges:			
Coal and wood	633,151	20,069,912	31.70
Gas (exclusive of hotplates)	[1] 1,500,319	63,724,354	42.47
Kerosene, distillate and fuel oil	1,107,568	13,603,219	12.28
Gasoline (exclusive of camp stoves) [2]	51,384	834,713	16.24
Combination coal, wood, and gas	[3] 100,167	9,714,787	96.99

	Maximum	Minimum	Average
Cooking:			
Electricity	$3.27	$1.05	$2.34
Gas	3.54	.91	2.08
Water heating:			
Electricity	5.10	2.90	3.99
Gas	4.18	1.25	2.65

[1] No gas. [2] No rate.

Comparison of domestic water-heater values based on 1939 Census of Manufactures

	Number	Value	Per unit value
Electric household storage water heater [1]	81,741	$3,339,535	$40.86
Nonelectric (domestic supply):			
Coal and wood:			
With storage tanks	58,091	1,597,910	.....
Without storage tanks	251,233	1,759,419	.....
Total	309,324	3,357,329	10.85
Gas:			
With storage tanks	462,184	13,850,911	29.97
Without storage tanks	[2] 356,959	2,226,515	6.24
Total	819,143	16,236,888	19.82
Kerosene and distillate (pot, wick, and wickless storage tanks) [3]	70,939	1,484,910	20.93
Total, nonelectric [4]	1,199,406	21,079,127	17.57
Total, electric and nonelectric	1,281,147	24,418,662	19.06
	Percent	*Percent*	
Ratio, electric and nonelectric	6.8	16.0	.....
Ratio, electric to total	6.4	13.7	.....

[1] Side-arm heaters not included because census lists them with auxiliary and nonpressure heaters with total value of $113,891.
[2] Approximate; no data available on number with value of $159,462, so number not included.
[3] Census does not mention fuel-oil water heaters nor storage tanks.
[4] Approximately 55 percent of the nonelectric heaters do not include storage tanks, thereby increasing amount of labor necessary to assemble or install on premises.

The State of North Carolina as of January 1, 1941, had 91,680 electric ranges and 47,350 gas ranges in use.

There are seven States where electric ranges exceed gas ranges in use, namely, North Carolina, South Carolina, Idaho, Nevada, Tennessee, Utah, Washington.

There are eight additional States where the number of electric ranges in use is close to the number of gas ranges in use (within 30 percent or less), namely, Maine, Vermont, North Dakota, South Dakota, Oregon, Georgia, Florida.

Source: Bureau of Census, Department of Commerce.

Total electric domestic customers	25, 600, 000
Total gas domestic customers	16, 900, 000
Difference (wired homes without gas)	8, 600, 000

Ratio of manufactured gas customers to total domestic gas customers is 10 to 17; 10 manufactured gas to 7 naturally mixed gas.

Thirty-two and six-tenths percent of the United States farms are electrified as of January 1, 1941. Electrified farms, 1,988,361; total farms, 6,096,789.

As of January 1, 1941, there are 15,238,000 household meters with water-heater rates of 1.2 cents per kilowatt-hour or less. There are 20,342,213 household meters with water-heater rates of 1½ cents per kilowatt-hour.

Three hundred and ninety-four private utilities included in this survey.

The CHAIRMAN. Mr. Blodgett, will you give the reporter your name, address, and information as to whom you appear for?

STATEMENT OF GEORGE R. BLODGETT, BOSTON, MASS.

Mr. BLODGETT. My name is George R. Blodgett. I am an attorney, a member of the law firm of Herrick, Smith, Donald & Farley, 1 Federal Street, Boston, and I do a considerable amount of corporate tax work. I am not appearing here specifically for any client. I ran into serious problems of the nature I am going to mention for about eight clients. They appeared to me so serious that after discussing the matter with others similarly engaged, I felt that they should be brought to the attention of the committee.

The CHAIRMAN. I see you refer to section 734. I never quite understood it; I don't know how it works out in practice.

Mr. BLODGETT. The main purpose of my talk is to point out some practical problems which have arisen in the mere preparation of clients' excess-profits returns. These problems have arisen under section 734 of the code, which was added to the excess profits tax law by the March 1941 amendments.

This section makes provision for adjustments in cases of so-called inconsistent position. The underlying purpose of this section is apparently to prevent a taxpayer from reducing its excess-profits tax through unconscionably reversing a position which had been erroneously allowed to it in some prior year tax matter and which had reduced its tax for that prior year. But it goes far beyond such a purpose and produces totally different and unfair results as I shall show by illustrations.

The section was enacted without general public discussion. The text of the section is not easy to read, nor are many of its possible results and implications apparent upon superficial analysis. In the months that have intervened, some of us have begun to realize how serious these may be. Apparently neither the taxpayers nor tax practitioners in general as yet understand the effect of the section, and the serious consequences under it involved in the mere filing of an excess-profits tax return, their ignorance being probably due to the fact that the section was not enacted until just before excess-profits

tax returns were due, and the regulations were not issued until weeks afterward, and the pitfalls in merely filing a return do not appear on a first reading.

Section 734 provides in principal part that: If a taxpayer, in connection with its current excess-profits tax return, maintains a position as regards any item, which position is finally adopted (the words "maintaining a position" are not defined), and that position is inconsistent with the way that item was actually but incorrectly treated in determining the tax liability for any year beginning 1913 of the taxpayer or any "predecessor" (the word "predecessor" is not defined in the law), then there is added to the excess-profits tax otherwise payable for the current year the amount of all taxes saved to the taxpayer and its predecessors, in all years since 1913, through the erroneous and inconsistent treatment of the item in the earlier years, together with interest at 6 percent from the time those prior-year taxes should have been paid. In other words, the penalty is not to fairly adjust its invested capital or other items entering into its 1940 excess-profits tax. The effect of the section is to go back and charge it with an item occurring in 1913 or 1920, and that is the penalty, even though there would be no excess-profits tax payable for 1940 regardless of which position it takes—whether consistent or inconsistent.

And that is so despite the fact that the statute of limitations has otherwise run, and despite the fact that the Bureau may have ruled that the taxpayer's prior-year treatment was correct under the regulations, decisions, and rulings in force when the prior-year return was made and audited.

This has much greater scope than a statute merely waiving the statute of limitations back to 1913 because (1) it imposes on a taxpayer the unpaid-tax liabilities of other independent taxpayers for which it may never have been liable under former law; and (2) it permits the Government to reopen specific tax liabilities previously brought to a final court or Board decision between the taxpayer (or a so-called "predecessor") and the Government.

It is not my purpose to discuss the philosophy underlying the section. I shall talk only about the hardships resulting from the present wording to taxpayers who are striving not to take inconsistent positions or to be otherwise unfair. I hope that a recital of a few of these hardships will lead the committee to ask the experts to carefully and fully consider this section because specific amendments can best be worked out in connection with such a full consideration, and I do not have the time to discuss the remedies here.

The section is seriously defective in leaving several of its most important terms totally undefined, as—

(1) What constitutes "maintaining a position" by the taxpayer. The regulations say that the mere filing of a return by the taxpayer does this, and there is no indication in the law or regulations that having once taken a position in this manner a taxpayer may later voluntarily withdraw or change his position. Probably most taxpayers have already irrevocably maintained inconsistent positions under this regulation without having any idea that they have done so, or that section 734 is in any way applicable to them.

(2) The statute does not define what constitutes a "predecessor" whose unpaid taxes may by the law be collected from this taxpayer. The regulations define this as any other taxpayer whose income-tax

liability for a prior year would have been different if there had been no inconsistency between the treatment of the item for the current year's excess-profits tax and the way the item was treated in finally determining the other taxpayer's taxes for the prior year. This makes the present corporation liable for taxes of persons for whom it never could possibly have been liable before section 734 was enacted, and whose action it could not have controlled. For instance, if a corporation has consistently and correctly treated its past distributions to stockholders as dividends out of earnings, it is nevertheless liable under section 734 for the unpaid taxes, however far back, of any stockholders who have treated any part of those distributions as nontaxable returns of capital. In no other case until section 734 was enacted has a corporation ever been liable for the taxes payable by its stockholders.

Using an extremely simple example to illustrate some of the difficulties with section 734 which arise before the current excess-profits return can be filed, assume that in 1920 a going corporation issued substantial amounts of its stock to many individuals for property in a transaction which everyone has always correctly treated as taxable to the individuals. The value of that stock when issued is material in computing the corporation's invested capital for excess profits tax purposes in 1940 and its depreciation in intervening years. While the value of stock is always a matter of opinion, which no one can answer definitely, even in the case of a stock listed on a national stock exchange when large blocks are involved, let us assume that $200 a share was the correct value which the corporation has consistently used and which the Bureau, after investigation, has always accepted. I have to warn the corporation that, if the 1920 taxes of any of the sellers of the property were determined by using a value of less than $200 a share, it will be liable for all the 1920 taxes those sellers thereby avoided plus 6 percent interest thereon since 1921. I must also warn the client that it must solve its problems before it files the excess profits tax return, because however serious the result under section 734, it probably will have no opportunity later to retreat from the position taken on its return

The corporation asks first how it can be liable for the seller's taxes since it could not possibly have been liable for them under the 1920 law or any other law until section 734 was enacted in 1941. I can only say that this section, as interpreted in the regulations, flatly makes it liable for taxes for which it could never otherwise have been liable, even if there were no statute of limitations. It imposes a brand new liability on my client to pay somebody else's 1920 taxes, and neither my client, nor any business to which it succeeded, was ever liable for those taxes, or ever had any opportunity to control them, or can now in practice find out their amount or anything else about them.

My client next points out that it would not have any 1940 excess-profits tax even if it valued that stock at zero and that, accordingly, it is not doing anything fair or unfair to reduce its excess-profits tax since there would not be any tax anyway. But these considerations make no difference in the application of section 734. It must pay the seller's 1920 taxes even though it has no 1940 excess-profits tax.

My client next suggests that we put on the return a rider disclaiming any intention to take any inconsistent position, and offering to let

the Commissioner reduce its invested capital to any figure necessary to avoid an inconsistency. But that will not help my client for the law does not allow such procedure to have any effect under section 734 on the addition of the 1920 tax, and does not give the Commissioner any discretion to reach a more equitable result.

The corporation then suggests that in order to avoid maintaining an inconsistent position in filing its return, it should value the stock at the lowest possible reasonable figure, say $150 a share, or even at zero. But I have to point out that it has no right to do anything like this; that it is required by law to file and swear to a correct excess-profits tax return, and that the use of any figure which it knows to be lower than the correct figure would constitute a fraudulent and false return in order to avoid the addition to the tax under section 734. The taxpayer is given no option to abide by its former incorrect tax position and pay the additional excess-profits tax thereby occasioned, as the alternative to paying the very large adjustment under section 734. It is required to file and swear to a correct excess-profits tax return, and therefore it has no option but to maintain the inconsistent position since, by assumption, the former position was wrong. A return which knowingly continued the former error and which gave the Government the additional excess-profits tax resulting from not making the so-called unconscionable change in position would be a return fraudulently made in order to avoid any larger additional tax under section 734 if a correct (though inconsistent) return was filed.

I also point out that if my client uses $150 on its excess-profits tax return and the Commissioner does not choose to attack the $150 figure, even though he knows it is wrong, the taxpayer will have to pay all the additional taxes for every intervening year from 1920 to the present which result from reducing its annual depreciation allowance on the property because of this reduction in purchase price, as well as any 1920 deficiency in taxes of the sellers resulting from their having used a value of less than $150.

Senator WALSH. Are these illustrations possibilities of construction, or have the constructions already actually been made?

Mr. BLODGETT. Returns involving these questions have been made; they have not been audited yet.

Senator WALSH. By the regulation and by the taxpayer's having been ordered to comply with them?

Mr. BLODGETT: There is no ambiguous language in the law; the Commissioner has no discretion.

Senator WALSH. And you are arguing that these regulations will result in these confusions and these hardships if the present language is permitted to stand?

Mr. BLODGETT. That is correct.

Senator WALSH. There have been no such tax returns yet?

Mr. BLODGETT. They have not yet been audited; they have been filed.

I next point out to the corporation that the law provides that when the people from whom it bought the property for stock sell the stock, if they paid too much tax then by using as a cost to them of the stock less than its real value in 1920, there is to be an adjustment under section 734 in my client's favor measured by the excess tax which these individuals paid on sales in the intervening years. Of course

it is entirely impossible for my client to determine, let alone bear the burden of proving, how much these unrelated sellers may have overpaid their taxes in the years between 1921 and the present.

In addition to the theoretical difficulties included above, consider the following practical ones:

(1) My client cannot determine the fair value of the stock in 1920, even if it knows all the basic facts, as value is a matter of opinion.

(2) Probably most records and data are destroyed and witnesses dead, so that the necessary basic facts cannot now be proved.

(3) It cannot determine how the sellers were taxed in 1920, what values they used for the stock, what surtax rates they paid, and what the property originally cost them; in all probability their taxes were settled by the Government on some informal compromise of the question of value at somewhat less than the $200 a share assumed to be correct.

(4) My client cannot prove the favorable adjustments to which it would be entitled because of unnecessary taxes paid by the sellers (through use of the low value) when they sold the stock.

(5) Under established principles, the burden of proving every one of these facts before the Bureau of Internal Revenue, a court or the Board of Tax Appeals, is on my client.

Finally, I must point out to my client one other possibility of trouble which seems so unjust that my client may question my sanity. It is reasonable to suppose that if the present taxpayer files a 1940 excess-profits tax return and under section 734 pays a large addition to that tax measured by unpaid 1920 taxes of the sellers, plus interest since 1920, it can then file its excess-profits return for the next year (1941) on the same basis without having to pay the 1920 taxes all over again as an addition to its 1941 excess-profits tax also. But the law does not so provide—section 734 makes the same 1920 adjustment an addition to the current excess-profits tax for each year. To be sure, the regulations provide the very sensible result that the additional 1920 tax is to be paid only once. However, even if we assume that the Commissioner will not amend this regulation in this respect, there is a serious question whether or not the Commissioner can by regulation entirely waive a tax required by act of Congress—that is, collection a second time as an addition to 1941 excess-profits tax of a 1920 tax adjustment already collected in connection with the 1940 excess-profits tax.

The corporation would be in no better position if the question of the value of the stock had previously been fought out to a final court or board decision in determining a prior year tax of either the taxpayer or the sellers. Section 734 allows the whole matter to be opened up (even though there is such a final decision) and the congressional committee report expressly contemplates that that shall be done.

The illustration above related to a simple case where the only trouble centered around the value of the stock. More difficult cases arise continually where there is a question of law as to whether the issuance of the stock for the property was a tax-free transaction to the seller because of some rule of law, such as that pertaining to nontaxable exchanges. A corporation's invested capital may be greatly affected by whether property which it acquired by issuing its stock was

acquired in a transaction which was tax-free to the seller of the property.

For instance, suppose the present taxpayer, corporation A, years ago when it was already a going concern, acquired property from corporation B by issuing some of its stock to B, and B then promptly distributed A's stock to its stockholders and dissolved. Assuming that the stockholders of B were entirely different persons from the stockholders of A, there is no fairness in now making A pay any taxes which B or its stockholders should have paid years ago. If the transaction was in fact treated as tax free to B and its stockholders, either as a result of applying specific provisions of the regulations then in force, or as the result of full investigation by the Bureau, or even as a result of a final court decision on the particular transaction, the whole matter may now be reopened. As a result A may now be required to pay all the taxes that B or its stockholders should have paid (since they are A's predecessors within the definition in the regulations) if it is now held under principles of cases decided perhaps 20 years after the transaction that it should have been treated as taxable.

This is a very real danger because of the great uncertainty as to what constitutes tax-free exchanges in reorganization, particularly in early years. Until 1924 no provision of the law specifically permitted a corporation to avoid a tax on the gain resulting to it from disposing of its property in a reorganization, but from 1918 on, the regulations permitted that to be done in many types of transactions which were rather loosely defined in the regulations. The question of the validity of those regulations and the question of whether a corporation could ever dispose of its property tax free in a reorganization between 1917 and 1924 has never been settled by any satisfactory court decisions; in fact, there are very few decisions on the entire subject.

The effect of section 734 is to now reopen all those questions. If the early year transaction is now held taxable, corporation A will have to pay all the taxes which corporation B and its stockholders should have paid 20 years ago, with interest at 6 percent, although it was never liable for any of those taxes, particularly those of B's stockholders, until section 734 was enacted. What is probably much worse in practice—neither the present corporation A nor the Commissioner of Internal Revenue can now possibly ascertain with any degree of accuracy any of the facts relating to those former taxes, such as the cost of the property to the selling corporation and the cost to its stockholders of their stock, the surtax rates which the stockholders then paid, or the facts necessary to determine the value of the stock issued which will measure the taxable profit. Presumably the Commissioner will "guess" at these amounts and arrive at a back tax liability adequate to surely protect the Government's interest, and the taxpayer cannot possibly bear the burden legally imposed upon it of both disproving the correctness of the Commissioner's figures and establishing the correctness of the figures which it wishes to have substituted.

In the 1924 act, a long detailed definition of what constitutes a tax-free reorganization is inserted and has been maintained since in large part, but despite the comprehensiveness of that statutory definition the exemptions have been greatly whittled down in recent years by Supreme Court decisions imposing further requirements for tax-free exchanges which are not even hinted at in the statutory definition. I refer to such cases as the decisions handed down in the middle

1930's requiring a "continuity of interest" in the transferor's stockholders in order to have a tax-free reorganization—this extra statutory limitation being still largely undefined by the decisions after 17 years of this statute. Another limitation introduced by the Supreme Court is the requirement of the *Gregory case* that a reorganization must have been for a business purpose. The effect of section 734 seems to be to now reopen the question of fact or law in all those cases closed by the Bureau in previous years as to whether there was a business purpose behind the reorganization—and the meaning of that phrase is still pretty vague.

As another example, decisions of five different circuit courts of appeals in the last few years show unutterable confusion on what is the basis to a corporation of assets acquired in a bondholders reorganization, at least three different rules being now in effect in different circuits. This is a question that enters into the computation of invested capital, and it is pretty hard to make the successor corporation guess correctly at this time which of the three rules will finally be adopted by the Supreme Court and if it guesses wrong to penalize it under section 734 by imposing taxes which ought to have been paid by bondholders individually.

There are an almost infinite number of other entirely different ways in which section 734 can operate unfairly or impractically, but I cannot go into them here.

In conclusion, I have stated that time does not permit me to discuss remedies which are needed and the particular form they should take. That is a problem falling within the competence of the technical experts.

Senator GERRY. Were any of these questions brought out in any of the House hearings?

Mr. BLODGETT. No, sir. So far as I know they were not.

Senator GERRY. Any hearing on this section before it was passed?

The CHAIRMAN. No; there were no hearings.

Senator GERRY. My recollection is there were no hearings.

The CHAIRMAN. There was an effort made to iron out a great many of the inequalities and a great many of the hard situations developed by the excess-profits tax and in certain respects, there were very constructive things worked out in that 1941 act, but there were no public hearings.

Mr. BLODGETT. I have sought to point out by concrete illustrations some of the dangers and probabilities of crushing hardship which the section in its present form contains. I believe the Congress has no desire to inflict unnecessary hardships and inequities upon taxpayers, and that this section was enacted without a clear realization of many of its possible effects. In the interests of ordinary fairness, I respectfully submit that it should either be revised on the basis of more equitable principles, or at least be limited in its operation to a reasonable period in the past. If these suggestions prove for any reason not to be feasible, then it is my conviction the section should be repealed.

The CHAIRMAN. Thank you very much.

Senator WALSH. Have you discussed this matter with the Treasury experts?

Mr. BLODGETT. This matter came up so suddenly that I have not had an opportunity; I have, however, communicated with them and

sent them copies and I hope to have an opportunity to discuss it further with them.

(Mr. Blodgett submitted the following additional memorandum:)

MEMORANDUM REGARDING SECTION 734 OF THE INTERNAL REVENUE CODE

Submitted by GEORGE R. BLODGETT, Esq., of Boston, Mass., supplementing his verbal statement

The great hardships which may result from section 734, as discussed below, should be corrected in the pending tax bill, rather than that correction be postponed until the proposed second tax bill planned to embody technical corrections. I fear that reenactment of the law by the present bill will be construed by the courts to give congressional approval to the present regulations which are responsible for many, but by no means all, of the inequities. Furthermore, any amendments affecting such vital matters with respect to 1940 excess-profits-tax liabilities should be passed as soon as possible in order that audits of 1940 excess-profits-tax returns (which presumably will commence shortly) may proceed without the unnecessary investigations and disputes which are certain to arise under the present section and which will waste the time of both the Bureau and taxpayers and involve the taxpayers in substantial expense. Taxpayers need to know where they stand on items having such large bearing on 1940 and future excess-profits-tax liabilities. The possibility of a large addition to 1940 tax under section 734, which is probably present in the case of most reorganized companies and many others, will furnish a serious obstacle to the sale by a corporation of its business or its reorganization into some other corporation, because such a sale or reorganization is often prevented if there is uncertainty involving a large amount of back taxes. If no extensions are to be granted for 1941 excess-profits-tax returns as announced, taxpayers will have to do much of the work of preparing them, if not actually filing them, before the proposed second tax bill is enacted. My office is now, because of section 734, spending weeks trying to ascertain the facts about certain clients' reorganizations before 1920, and our clients should be relieved of this burden as soon as possible.

The problems which have arisen in my practice and to which my speech before the Senate Finance Committee and this memorandum are devoted center around corporations which have no desire to take any unconscionable inconsistent position, but which on the contrary are striving to find some honorable way, by making concessions or otherwise, to avoid the tremendous penalties which may be imposed by section 734.

The remainder of this memorandum falls under the following heads:

I. THE STATUTE SHOULD BE SPECIFICALLY AMENDED, AND RELIEF SHOULD NOT BE LEFT TO ADMINISTRATIVE PRACTICE.

II. LISTING OF OBJECTIONS TO THE PRESENT STATUTE.

III. A FEW ILLUSTRATIONS OF SITUATIONS TO WHICH SECTION 734 MAY RELATE.

IV. SOME GENERAL SUGGESTIONS ABOUT REMEDIES.

I. *The statute should be specifically amended, and relief should not be left to administrative practice.*—It has been suggested that instead of amending the statute, Congress and taxpayers should hope that the Bureau of Internal Revenue will not apply the statute except in cases where the taxpayer is knowingly adopting some clearly unconscionable change of position, and then only to the extent necessary to prevent an unconscionable reduction of current excess-profits tax.

The statute gives neither the Commissioner, the Board, nor the courts the slightest discretion to waive or ameliorate its effect in any respect, nor do the Commissioner's regulations contain the slightest hint that anything of this kind is to be done. Tax practitioners seldom find employees of the Bureau waiving in the taxpayer's favor tax liabilities which are mandatory under the statute and regulations. Tax practitioners may well fear that the Commissioner's true attitude toward administration of this section is well indicated by the provisions of his recent regulations on section 734 which are much more oppressive than anything required by the statute in that they:

(1) Greatly extend the meaning of "predecessor" beyond anything required by the wording of the law, so as to subject the taxpayer to prior year tax liabilities of other taxpayers for which it was never liable until section 734 was enacted. See illustrations (*a*), (*b*) and (*c*) below.

The regulations ignore one limitation given in the congressional committee reports as to what constitutes a "predecessor." See discussion under objection (5) below.

(2) Provide that the mere filing of a tax return is maintaining a position by the taxpayer, thereby probably subjecting thousands of taxpayers to unfavorable adjustments under section 734 who had no idea from the wording of the law that the mere filing of a return subjected them to section 734 and even though the regulation was not issued until weeks after the return was filed. See discussion under objection (3) below.

I have not learned of any instructions issued by the Bureau to field agents indicating that section 734 is to be applied otherwise than in accordance with the literal terms of the law and regulations.

But even if the statute were amended so as to expressly give the Commissioner a discretion both as to whether to apply section 734 in any case or to waive part of the adjustment required, and even if we assume that the Commissioner, and all his subordinates, would show great courage and a wonderful sense of fairness in applying this section, the principal difficulties would still remain. It would be an entirely novel departure in taxation, and a most dangerous experiment, to pass laws unqualifiedly subjecting taxpayers to heavy taxes and then give the Commissioner a discretion to waive the tax in the hope that he and all his subordinates would develop the unusual qualities necessary to administer it fairly. Many questions of statutory interpretation governing prior-year tax liabilities are still entirely unsettled. It cannot be supposed that in such cases the Commissioner will fully abandon the possibility that a prior-year tax may be unpaid, or that the taxpayer will be happy to concede the Government's arguments and pay an adjustment under section 734. For instance, I point out below that, while regulations and administrative practice permitted corporations to dispose of assets tax-free in reorganizations before 1924, there was no provision of law to that effect and it is still entirely uncertain whether those transactions were in fact tax-free. Can anyone expect that the Commissioner, if vested with a discretion, would exercise it so as to waive all adjustment under section 734 until this point of law is finally settled by a Supreme Court decision? As shown under objection (8) below, many of the facts relating to a deficiency in prior years' taxes cannot now be either ascertained or proved, particularly those which relate to so-called "predecessors"; and it is impossible that any exercise of an expressly granted discretion would generally reach fair results in such cases.

The existence of any such discretion in the Commissioner would in effect negative any benefit of the taxpayer from applying to the Board or the courts. If the Commissioner is given a discretion and offers a compromise, the taxpayer must accept it however unfair, or lose the benefit of the offered compromise if it appeals; for it is well established that the Board and the courts decide tax liabilities according to the meaning of the law and without any discretion whatsoever to relieve against hardships or results not contemplated by the framers of the law.

And whatever the Bureau intends to do in administering section 734, I do not believe that the members of the field staff of the Bureau are competent by training or experience to exercise any discretion which might by express amendment of the statute be given them to enforce the statute only so far as necessary to prevent grossly inequitable changes in position to the manifestly unfair disadvantage of the Government. My experience is that most of the Bureau's field representatives are sincere, honest men who would like to be fair but who feel obliged by the Bureau's rules of procedure to give no consideration at all to questions of fairness or equity, but to follow the letter of the law and regulations (even though inconsistent with all decided cases) in order to assert the maximum tax possible, and, where a question of doubt arises, to take the position most favorable to the Government in the particular case, even though that results in the Government arguing at the same time for both sides of a single question. I doubt whether the average revenue agent or conferee will have any better view than I have been able to form as to whether reorganizations of corporations before 1924 were taxable to the original corporation, and many other unsettled questions of law which will arise to a great extent in applying section 734. I shall expect the average revenue agent to assert the maximum addition to tax under section 734 sustainable on any theory that is not clearly discredited by decided cases, and I

see years of litigation ahead because I do not think any of his superiors will take the responsibility for reducing his determination materially until the whole matter has been thrashed out in court.

Furthermore, I usually find that if I do get a concession from the Bureau on one point in a case, I am forced to pay a pretty heavy price for it in conceding to the Government other independent points.

II. *Objections to the present statute.*—(1) While the purpose of section 734 was apparently to prevent a reduction of the current excess-profits tax through an unconscionable change of position, the remedy provided by section 734 is not the reduction of invested capital or income credit so far as necessary to avoid such an unconscionable advantage, but is in effect a penalty measured by some prior year tax which bears no relation in amount to the current year's excess-profits-tax saving resulting from the so-called change of position, conscionable or unconscionable. For instance, I have clients who might be subject to a staggering prior-year adjustment under section 734, even though they have no current excess-profits tax to pay whichever of two positions they take (one consistent with the prior year determination, the other inconsistent). I am told of a case involving a war-profits tax of 60 percent. This means, on each million dollars of profit which was not taxed in 1917 under rulings then in force but subsequently upset, an adjustment under section 734 of $600,000 tax, plus $900,000 interest (25 years at 6 percent), or a total adjustment under section 734 of $1,500,000. The effect on invested capital cannot be greater than the increased credit of 8 percent, $80,000, and the current excess-profits tax saved cannot be greater than the maximum 50 percent rate of $40,000. In other words, the penalty on the taxpayer because the Government determined its 1917 taxes incorrectly although in accordance with the Bureaus' rulings then existing is, as to each $1,000,000 of error in taxable income, an adjustment of $1,500,000, in tax under section 734 even though the maximum reduction of current excess-profits-tax is $40,000.

(2) The taxpayer is given no right to continue its former position, pay the increased current excess-profits tax and thereby avoid any adjustment under section 734. As the purpose of section 734 is to prevent the taxpayer from taking inconsistent positions, he should be allowed to do just this. But, assuming, as the statute presupposes, that the former position is incorrect, the taxpayer in filing its 1941 return cannot continue that former position because it is required by law to file and swear to a correct tax return, which necessarily forces it to take an inconsistent position. Any return knowingly continuing the former error would be false and fraudulent to evade tax (i. e., the adjustment under sec. 734). Example (*d*) below gives an instance where the only 1940 excess-profits tax return which the taxpayer can correctly file is necessarily inconsistent with the prior-year determination, and the correct excess-profits-tax return has the effect of increasing the current excess-profits tax over what it would be if the taxpayer continued the former erroneous position, but the taxpayer is nevertheless subjected to an adverse prior-year adjustment under section 734.

(3) While the regulation (sec. 30.734–2) says that "the making of the excess-profits-tax return * * * is a determination by the taxpayer," from which he apparently cannot later withdraw, the taxpayer has no right to put on his return a statement either (*a*) denying any intention to take an inconsistent position, or (*b*) agreeing to reduce its invested capital, or otherwise increase its excess-profits tax, so far as necessary to avoid unconscionable benefit from any inconsistency and to prevent any adverse adjustment under section 734.

(4) By requiring adjustments for all prior years back to 1913,[1] the taxpayer is charged with back tax liabilities for years (*a*) when no one then knew, or may now know, what the correct rule of law was; (*b*) for which the case was closed after full consideration of the express transaction in accordance with the existing regulations and decisions; and (*c*) when the necessary facts to determine the tax liability cannot now be ascertained by anyone. For instance, I have in my practice encountered many cases where going corporations before 1924 issued their stock to acquire other businesses. No provision of the law expressly permitted a corporation to dispose of its assets tax-free in a reorganization before 1924. The regulations provided that this could be done tax-free in certain loosely defined cases, but only if the sole consideration received was stock. Bureau practice regularly held reorganizations of that general type tax-free. There are no authoritative court decisions on this subject, and what few decisions exist are in

[1] Except recent years not barred by the statute of limitations.

considerable confusion. My client should not now be required to litigate a question of law as to whether the reorganization was tax-free to the absorbed corporation, and such questions of fact as the value, years ago, of my client's stock issued on the reorganization and the tax cost to each of the absorbed corporations of the assets transferred. As an additional complexity in such cases, the *Hendler case*[2] indicates that the invariably necessary assumption of the absorbed corporation's liabilities prevents the absorbed corporation from having disposed of its assets solely for stock, which was one of the flat requirements of the regulations before 1924,[3] and the amendatory legislation following the *Hendler case*[4] does not apply to taxable years before 1924.

(5) The term "predecessor" is not defined in the law. It is defined by the regulations to include: "any taxpayer * * * whose income tax liability for such prior taxable year would have been different if there had been no inconsistency between the treatment accorded an item or transaction in the determination of the excess profits tax liability of the taxpayer and the treatment accorded such item or transaction in the determination of its (i. e. the predecessor's) own income tax liability for such prior taxable year" (sec. 30.734–1).

This regulation has the effect of saddling the taxpayer with tax liabilities of other persons for which it could never possibly have been liable until section 734 was enacted. In that respect section 734 goes far beyond any waiver of the statute of limitations or any purpose to prevent the taxpayer from taking a position inconsistent with one which it has previously taken. For example, under the definition in the regulations:

(i) A mining corporation which has consistently and correctly treated all, or part, of its distributions to its stockholders as taxable dividends, is liable for the unpaid taxes back to 1913 of any of its stockholders who have reported less than the proper amount as taxable dividends.

(ii) Assume that corporation A acquired the assets of corporation B before or after 1924 for A's stock, that B then distributed A's stock to B's stockholders, and that the transaction was incorrectly ruled a nontaxable reorganization. Section 734 makes A liable not only for B's unpaid taxes but for all the unpaid taxes of B's stockholders for which latter taxes it could not conceivably have been liable before section 734 was enacted.

In fact, it has been suggested, apparently correctly, that every expense item or capital disbursement ever previously made by a corporation may give rise to an adjustment under section 734. For instance, assume payment of a cash salary or a purchase of supplies for cash in 1920. If the employee or supplier fraudulently or negligently failed to report the receipt of the cash, there seems to be an inconsistency between his failure and the reflection of the item in the corporation's statement of accumulated earnings and profits on the excess-profits-tax return, which under the regulations makes the corporation liable for the unpaid 1920 tax of the employee or supplier.

Note that the regulation entirely omits the following additional requirement contained in the definition of "predecessor" given in the committee report on the 1941 bill as one "whose tax liability in a prior taxable year in respect of a particular item affects the liability of a taxpayer under chapter 2E with respect to such item * * *."

Whatever the foregoing statement means, it clearly shows a congressional intent that in none of the examples given above shall the corporation be liable for the unpaid taxes of its own stockholders or those of corporation B's stockholders or of its employees or suppliers.

(6) The statute does not define what constitutes maintaining a position by the taxpayer. The regulations, section 30.734–2, state: "the making of the excess-profits-tax return required by section 729 or section 730 is a determination by the taxpayer * * *."

Neither the statute nor the regulations indicate that having once filed its tax return, the taxpayer may later withdraw therefrom or take some other position. Of course, the taxpayer may be relieved from his original position if the Commissioner takes some other position on the item or a board or court finds otherwise. But such a result is unlikely if the taxpayer has fulfilled his duty of filing a correct return in the first place, and the taxpayer is thereby probably bound to pay any adjustment under section 734 because of some prior year error.

The statute is defective in not plainly defining what constitutes "maintaining a position" by the taxpayer. The practical difficulties are accentuated by the

[2] 303 U. S. 564 (1938).
[3] Regulation 62, art. 1566.
[4] Sec. 213 of the Revenue Act of 1939.

fact that the taxpayer puts on its 1940 excess-profits tax return only a few figures for the components of invested capital (such as the totals of accumulated earnings and profits, and of property paid in for stock) and certain figures for its income for the 4 base-period years. There is no requirement that it explain the computation of these items, and it will not normally do so nor state specifically its position with regard to any prior-year transaction. Accordingly, the regulation must mean that filling in a single figure, as the total of earnings and profits, constitutes maintaining a position by the taxpayer as to every single item in its entire past history which enters into the computation of that figure, even though neither the detail of that computation nor any statement concerning any transaction is required to be set out on the return.

Section 734 is usually thought of as relating to invested capital matters, but items of income or expense for the 4 base-period years are within its scope. The taxpayer has no alternative but to use the correct figures for such base-period years on its excess-profits-tax return, and is thereby maintaining in connection with its 1940 excess-profits-tax return a position on every item which enters into its 1936 to 1939, and even 1940, taxable net income. Among such items will be depreciation, so that it is maintaining a position as regards the cost to it of all depreciable property, which may well be inconsistent with some prior year determination with regard thereto as applied to it or a predecessor. But it has no choice but to insert as its base-period income the correct figures for its base-period years.

The theoretical concept may be that, before filing an excess-profits-tax return, the taxpayer should go back and analyze every transaction it ever had in order to determine its correct effect on accumulated earnings and profits, etc., under the most recent retroactive decisions and statutory changes. But in practice that theoretical ideal is never reached—the taxpayer usually takes its book figures, particularly where no excess-profits tax is involved anyway. I am firmly convinced that if the foregoing regulation is correct the large majority of taxpayers who filed excess-profits-tax returns have subjected themselves to adjustments under section 734, which bear no relation to the amount of any reduction of the excess-profits tax, because the returns involve a change of position, conscious or unconscious, and that most of those taxpayers have either never heard of section 734, or have no idea that it applies to their facts. After all, the regulations greatly extending the meaning of "predecessor" and "maintaining a position" were not issued until weeks after the 1940 excess-profits-tax returns were originally due.

(7) It permits reopening of cases already specifically decided by final decision of the Board and courts in a proceeding between the taxpayer (or its so-called "predecessor") and the Commissioner. In that respect it goes far beyond a waiver of the statute of limitations. The congressional report on the 1941 bill expressly contemplates (end of first paragraph under sec. 11) that neither a "closing agreement, Board decision, or rule of *res judicata*, etc. * * * " shall bar an adjustment under section 734.

(8) Of the utmost importance to the tax practitioner is the practical impossibility of anyone determining, let alone proving, the facts relating to the prior year transactions. Consider the many cases of reorganizations before 1924 which have come up in my practice. I have not, in most instances, been able even to find out whether the reorganization was finally determined, in settling prior taxes of the predecessor, to be taxable or tax free. Whether as a matter of law it should have been taxable or tax free is still entirely vague. And I cannot determine the facts necessary to prove the value of the successor corporation's stock issued for the assets on the reorganization, let alone the tax cost to the absorbed corporation of the assets involved, or, as regards the stockholders of the absorbed corporations, the tax cost to each of them of the stock which they previously held and their surtax rates, etc. In no case have I been able to make even the roughest estimate of what the adjustment under section 734 might amount to. In most cases the records of the predecessor corporations are destroyed and their officials are dead. I do not know how to even start finding out who their stockholders were.

The Commissioner will be in little if any better position to determine these back facts. Presumably he will be unable to determine them in large part, and will accordingly "guess" at the amount of the tax liability to be determined against my client under section 734, which guess will presumably be large enough to contain a margin necessary to fully protect the Government's interest. How can I hope to bear the burden of proof imposed upon the taxpayer by the Commissioner, the Board, and the courts of both affirmatively disapproving the Commissioner's determination and affirmatively proving the correct figure?

(9) The statute apparently contemplates some adjustments in my client's favor in computing the net adjustment to be paid by it under section 734. For instance, in the illustrations given above where my client is made liable for taxes not paid by: (1) its former stockholders on dividend distributions, or (2) by stockholders of the absorbed corporation upon a reorganization, the statute contemplates that my client shall have a favorable adjustment measured by the tax paid by such stockholder on later selling his stock which would not have been payable if he had treated the prior year transaction correctly. But it is utterly impossible to claim any such favorable adjustment because of lack of ability to ascertain and prove whether or not the stockholders sold their stock, the price received, the tax rate, etc. The Bureau could not let my client see any of the tax returns of the stockholders.

Any such favorable adjustment relating to a year for which correction is not prevented will be made by refund to the stockholder or other "predecessor".[5] If my client is charged with the original adverse adjustment under section 734, it should be entitled to the benefit of all subsequent reductions of tax liability consequent thereon, but the statute prevents any such favorable adjustment being made to it under section 734 in respect of a year for which correction is not prevented, and it is given no right to recover any refund made to the stockholder or other so-called "predecessor."

(10) The statute contemplates that in some cases the net adjustment under section 734 may be favorable to the taxpayer. But that benefit is largely illusory.

The adjustment is to be made only if the Commissioner "maintains" a certain position. This necessarily means a position different from that taken by the taxpayer. Assuming that the honest, reasonably intelligent taxpayer, in whom alone I am interested, has probably made out correct excess-profits tax returns (at least unless the question involved is one of law which is still unsettled), the Commissioner will then have no occasion to maintain any position different from the taxpayer and there will be no favorable adjustment under section 734, however much the taxes were improperly overpaid in a prior year, because the Commissioner has not met the statutory requirement of maintaining a position. Furthermore, it is difficult to imagine that the Commissioner will ever maintain a position which will have the effect of reducing the total taxes to be paid by the taxpayer.

Also, the favorable adjustment to the taxpayer can only operate as "a net decrease" to "be subtracted from, the tax otherwise computed under this subchapter * * *" (Section 734 (c) (1)), so that the favorable adjustment cannot exceed the excess-profits tax otherwise due. On the other hand, the adverse adjustment against the taxpayer is unlimited under section 734, and may be a very large amount even though no excess-profits tax at all would have been due had the taxpayer been legally able to file an excess-profits tax return not containing the inconsistent position.

(11) The statute should plainly adopt the statement of the regulations that, if the taxpayer fully pays the prior year tax as an addition under section 734 to its 1940 excess-profits tax, it does not have to pay the same prior-year tax over again, if succeeding excess-profits tax returns taking the same inconsistent position are filed. The statute requires an annual adjustment under section 734, measured each year by the full amount of the prior-year tax and interest. While the regulation provides that the adjustment shall be made only once, there is doubt about the Commissioner's power to waive totally a tax provided by act of Congress, (i. e., the adjustment under section 734).

III. *A few illustrations of situations to which section 734 may relate.*—Application of section 734 may result from an infinite number of types of prior year transactions. The excess-profits tax returns require that one figure be filled in for "Property paid in for stock, or as paid-in surplus, or as a contribution to capital," and one for "Accumulated earnings and profits" (schedule B, lines 2 and 4). Practically every past transaction will be reflected in these items or in other information called for by schedule B, or in the base period years' data required in schedule A, so that in filing the return the taxpayer is, under the regulation, maintaining a position on each past item which enters into any of these figures. If any of those past transactions were incorrectly taxed to either the taxpayer or its so-called predecessors, section 734 becomes applicable.

A principal source of trouble will certainly be the question of whether prior-year reorganizations of corporations were tax-free or taxable under rules which vary with statutory changes (some retroactive) and with decisions which always

[5] Note the use of the phrase "such year" in the third sentence of section 734 (d)

have retroactive effect. There is still grave doubt whether, prior to 1924, a corporation could dispose of its property tax-free in any type of reorganization, and the rules governing tax-free exchanges then by stockholders are still entirely unsettled in many of their most important respects. The statutory provisions introduced in 1924 were greatly varied or limited by subsequent Supreme Court interpretations, such as the *Gregory case*, which did not come down until 1935, and the *Pinellas case*, about the extrastatutory requirement of a continuity of interest, which did not come down until 1933. My address to the Senate Finance Committee referred to the fact that five different circuit courts of appeal by recent cases hold at the present time three different views of the basis to a corporation which results from a bondholders' reorganization.

The following other illustrations are given above:

(*a*) The case where an officer, employee, or supplier has incorrectly failed to report as income wages, salaries, or price of supplies paid him.

(*b*) The case where stockholders of taxpayer have failed to report the proper amount of distributions as taxable dividends.

(*c*) The case where corporation A acquired corporation B's business for stock of A which B promptly distributed in liquidation to B's stockholders. Corporation A may be liable for adjustment under section 734 if B's stockholders incorrectly paid too little tax on the transaction through treating it as either tax ble or nontaxable.

Additional instances which will probably frequently arise in practice are:

(*d*) Whether a transaction under which property was acquired for stock constituted a tax-free exchange under section 112 (b) (5) or corresponding provisions of a prior law (transfer to a controlled corporation). This section was first interpreted to apply only where the property was other than cash (GCM 2862; VII–1 CB 161 (1928)).

This former Bureau rule was overturned by the courts, (*Halliburton et al* v. *Commissioner* 78, F. 2d, 205–CCA9–1935). As a result, the taxpayer which followed the Bureau's prior-year determination and claimed a new, higher, basis of property so acquired will be taking an inconsistent position if it files its excess-profits tax return on the correct basis using its predecessor's cost. It would thereby become liable for a section 734 adjustment measured by excessive depreciation claimed and allowed in prior years through using the higher basis, even though the effect of using the low basis on its excess-profits tax return is to increase, rather than reduce, its current excess-profits tax. The only escape from this result would be to file knowingly false excess-profits tax returns continuing the erroneous position adopted by the Bureau in closing the prior years' taxes.

(*e*) Whether the acquisition of property by a parent corporation on a liquidation of a subsidiary during a consolidated return period before 1929, was a tax-free exchange. Many such cases were treated as tax-free by the parent company under Sol. Op. 131 (I–1 CB 18–1922); GCM 1501–VI–1 CB 260–1927 and these rulings were not authoritatively revoked by the Bureau until GCM 11676–XII–1 CB 75 in 1933.

(*f*) The illustration in my address to the Senate Finance Committee, relating to the situation where a corporation at any time issues stock for property in a transaction correctly treated as taxable by everyone involved, stressed that the corporation is taking an inconsistent position and subjecting itself to penalties under section 734 if it values the stock which it issued (for purposes of determining the cost at which to enter the property acquired, and hence invested capital under sec. 718 (a)) at a higher figure than the Bureau used in determining the seller's taxes. This holds true even though the corporation's determination of value is correct, or as correct as any determination of value can be.

(*g*) Inconsistent positions may be forced upon the taxpayer by retroactive changes in the law. I refer to the retroactive amendments under section 115 about computing earnings or profits which are applicable under all prior revenue acts as of the date of their enactment.[6] Similarly, with regard to legislation to correct the *Hendler case* situation which was retroactive to 1924.[7] Under these, the taxpayer may be able to file a correct 1940 excess-profits tax return only if it adopts a position inconsistent with one it took under the prior law but which was correct under the prior law, and may, nevertheless, be subject to a prior year tax adjustment under section 734 because the prior-year law has been amended retroactively so as to increase taxable income beyond what it would have been under the law originally applicable to such prior year. Nothing in section 734 says that

[6] Section 601 of the Second Revenue Act of 9940.
[7] Section 213 of the Revenue Act of 1939.

the correction is to be determined by the law originally applicable to the prior year, rather than by such law as amended after the prior year tax liability was finally determined.

(*h*) Prior year matters concerning the amount of depreciation allowances, and questions of "allowable" against "allowed" depreciation, may be reopened under section 734. If the taxpayer, in correctly computing its base period normal tax net income in schedule A of its 1940 return, uses figures arrived at by claiming depreciation on certain property on the basis of a 50-year life, whereas it formerly claimed and was allowed depreciation on a 33⅓-year life, it is maintaining an inconsistent position and may be charged with the tax avoided by using the higher depreciation in the earlier years. This is true even though it is willing to concede that the full amount of prior year depreciation is an adjustment to its cost basis so that there will be no duplication of depreciation deduction in the future.

IV. *Some general suggestions about remedies.*—I disapprove of the whole philosophy of section 734 and believe that it should be stricken out in toto. I feel that the general principles which make the statutes of limitation desirable in other fields of law are particularly applicable in tax matters, where returns are promptly audited, where large amounts are involved, and where questions of fact and law usually are so uncertain and difficult to prove that it imposes a serious burden on all parties to reopen questions years afterward. The burden is particularly serious on the taxpayer, who almost invariably has to bear the burden of proof.

But, if there must be something of this kind in the law, the correction should logically and sensibly be a prevention of any inequitable excess-profits tax advantage which the taxpayer might obtain through a change of position, rather than a penalty measured in some other entirely different way. In other words, the taxpayer's current year excess-profits tax credit, based either on invested capital or on base period income, may be reduced so far as necessary to prevent its receiving the benefits of an unconscionable change of position, unless and until either:

(1) It affirmatively chooses to pay the deficiency in prior-year taxes in order to avoid such a reduction of its current excess-profits tax credit (in such case it should not be penalized by having interest added to the prior-year tax); or,

(2) The aggregate amount of additional excess-profits tax paid by it over a period of years as a result of such reduction in its exemption equals the amount of the prior year deficiency.

After that there should be no reduction of its excess-profits tax credit because of the inconsistency.

Such a remedy would effectively prevent any unconscionable advantage which I believe section 734 was designed to prevent. It does not impose the hardship of a large penalty adjustment under section 734 on a taxpayer which has merely followed the statutory requirement of filing a correct excess-profits tax return and which would not have paid any excess-profits tax whichever of the several possible positions it had adopted on its return with regard to a given item.

There should be a provision that the taxpayer is not required to elect whether to pay the back tax or to suffer a reduction of its credit until the amount of the back tax has been finally determined by agreement with the Government or by board or court decision.

The party, Commissioner or taxpayer, which is seeking an adjustment favorable to it under this section should be required to bear the burden of proof, for in many cases this will prove in practice an impossible burden to bear.

No adjustment because of deficiency in taxes for any year should be considered except for years commencing after December 31, 1935. This is due to the difficulties of proving facts further back than that date, and to the many changes in the rules of law made since that date by court decisions which interpret the reorganization sections retroactively to 1924, and other sections of the law even further back. I select this date because it marks the beginning of tax years following the rendering of revolutionary decisions interpreting the reorganization and liquidation sections in ways not previously contemplated. I have in mind, particularly (1) the *Gregory case* in 1935, imposing an entirely extrastatutory limitation on reorganizations that they be for a business purpose, a largely undefined term; (2) the *Pinellas case* (1933) and the *Minnesota Tea case* (1935) imposing the extrastatutory limitation on a tax-free reorganization that there be a "continuity of interest"; and (3) the *Riggs National Bank case* in 1932 and the *Aluminum Goods Co. case* in 1933, holding that liquidations of consolidated subsidiaries before 1929 were taxable transactions.

The statute should define what constitutes "maintaining a position," and a taxpayer should be expressly allowed to withdraw without penalty from any position which it has taken until final determination of the tax.

The term "predecessor" should be expressly defined in the statute and should be limited to the present taxpayer, or to taxpayers whose actions the present taxpayer controlled in the earlier taxable year through ownership of a majority of their voting stock. A taxpayer is not normally liable for any other party's prior-year deficiencies. It should certainly not be liable for taxes on its stockholders or for taxes of stockholders of companies absorbed by it as it is made liable under section 734, as shown in examples given above. It is not equitable to make the taxpayer liable by adjustment under section 734 for deficiencies of every business to which it succeeded and for whose unpaid income taxes it was originally liable as transferee or because of the operation of some sales-in-bulk law. The reason why this would be inequitable is found in the procedure usually adopted when corporation A absorbs corporation B's business. Usually an estimate is made of B's probable tax liabilities and the consideration to be paid by A for B's business in stock or otherwise is fixed in relation to those tax liabilities, and A is secured in some manner against B's having any larger tax liabilities. This may be done by deferring final payment of the purchase price until B's tax liabilities are wound up, or by taking a guaranty (secured or unsecured) of some of B's officers or stockholders. Any such rights which A previously obtained to protect itself would be valueless to it if the burden of B's former taxes is now imposed on it through a section 731 adjustment, since, in the case of a transaction taking place even only a few years ago, the parties would have believed that the prior year taxes were all wound up when the statutes of limitations expired, and the purchase price would have been finally paid and the security released or guaranty canceled. Furthermore, any such agreements or guaranties would have related strictly to income taxes paid in respect of years before the reorganization, and an adjustment under section 734 would not come within their scope because the additional amount to be paid under section 734 is not paid as a prior-year tax, as such, but as an addition to the current excess-profits tax. (See sec. 734 (c).)

The CHAIRMAN. Charles E. Mickelwait.

STATEMENT OF CHARLES E. MICKELWAIT, NEW YORK, N. Y.

The CHAIRMAN. Mr. Mickelwait, are you addressing yourself to any particular portion of this bill?

Mr. MICKELWAIT. My views are my own. I have no interest other than the 10,000,000 other bettors, who I hope will agree with what I am about to tell your committee.

Senator WALSH. Are you going to speak generally, on the bill?

Mr. MICKELWAIT. I am going to speak generally on the 10-percent tax on mutuel—parimutuel betting. I hope that the other 10,000,000 agree with me. I know that the Government needs the money; I think it is justifiable. I think I am competent to speak on the subject. I am a retired racing official; I have had much experience and am considered an authority.

The CHAIRMAN. There is nothing in this bill on that as it now stands. Do I understand that you wish to recommend the inclusion of such a tax?

Mr. MICKELWAIT. Yes.

The CHAIRMAN. It is not in the bill. However, we are not bound by what is in there. We can consider it. Go on.

Mr. MICKELWAIT. I read over a statement by Mr. Carr, who presented the side of the racing associations, and I believe that my ideas reflect the views, or I hope they do, of the other bettors.

Senator GEORGE. You may proceed.

Mr. MICKELWAIT. The point I would like to make is that an added tax of 10 percent would not disrupt it greatly, and the suggestion I have to offer is that, in order to accomplish this, the programs should

be reduced to six races daily, which would have the effect of sending people home earlier and make it generally more satisfactory. The majority of bettors are $2 bettors; none of them win. They may be temporary winners but, in the end they are all losers. It is a very desirable means of securing money for the Government. Those are my views.

The CHAIRMAN. If you have any particular brief or memorandum you wish to file, you may give it to the reporter.

Mr. MICKELWAIT. I would be glad to give any further information that would be helpful to the committee.

Senator WALSH. How much money do you estimate this plan would bring in?

Mr. MICKELWAIT. I should say there will be about $500,000,000 bet this year and you could realize $50,000,000 on a 10-percent tax.

Senator WALSH. That is all.

The CHAIRMAN. That is all. I believe that completes the list of witnesses for the afternoon, unless there is someone here who desires to make a statement so as to avoid returning in the morning.

Is there anyone here who would care to be heard this afternoon?

(No response.)

The CHAIRMAN. We will recess until 10 o'clock in the morning.

(Thereupon, at 4:15 p. m., a recess was taken until 10 a. m., Tuesday, August 12, 1941.)

REVENUE ACT OF 1941

AUGUST 12, 1941

UNITED STATES SENATE,
COMMITTEE ON FINANCE,
Washington, D. C.

The committee met at 10 a. m., pursuant to adjournment, in room 312, Senate Office Building, Senator Walter F. George (chairman) presiding.

The CHAIRMAN. The committee will come to order. Congressman Harter, please.

STATEMENT OF HON. DOW W. HARTER, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF OHIO

Mr. HARTER. Mr. Chairman, and gentlemen of the committee, my name is Dow W. Harter. I represent the Fourteenth District of Ohio, which includes Akron, the largest manufacturing center for tires and tubes in this country. Because of the special interest which my district has in this question, I am making this presentation on behalf of the industry. Mr. C. W. Halligan, of the Rubber Manufacturers Association, will assist in answering any questions which you may wish to ask when I have finished my statement.

The rubber industry recognizes that that total tax load of this country must be increased heavily. The rubber industry is prepared to pay cheerfully whatever part of this increased tax burden can be fairly assigned to it.

We know that any industry which raises the question regarding the proposed tax program may expose itself to the charge that it welcomes taxes for everybody else except itself, but rate of excise taxes on tires and tubes is already so far out of line, on the high side, when compared with the tax on similar products that we are not in the least ashamed to call your attention as forcibly as possible to this inequity.

Tires and tubes.—The excise tax on tires and tubes is on a weight basis; 2½ cents a pound on tires and 5 cents a pound on tubes. This amounts to 8.9 percent ad valorem. Tires and tubes obviously are automobile parts and accessories. The tax on all other automobile parts and accessories is only 2½ cents. In the revenue acts prior to 1932, the rate of excise tax on tires and tubes had always been exactly the same as the tax on other parts and accessories, as it logically should be.

In the 1932 act, when these taxes were revived after a lapse, the House proposed the same basis for tires and tubes as for other parts and accessories. The Senate proposed to substitute an import tax

on crude rubber for the excise tax on tires and tubes. This plan was abandoned and the excise tax based on weight was hastily adopted apparently without the realization that the rates would work out to be almost four times as heavy percentage-wise as they should be. Not only is the tax on tires and tubes much heavier than on other automobile parts and accessories and similar products where the rate is only 2½ and 3 percent, it is even higher than it is on many luxuries. Tires are not a luxury, but a necessity used by all classes of people, including most laborers and farmers, and they should not be taxed at luxury rates.

Section 535 of H. R. 5417 the revenue bill of 1941 passed by the House of Representatives doubles the excise taxes on many items including tires and tubes. We recognize that it is a natural instinct at a time like this when more money must be raised by taxation to make a flat increase of a given rate in all taxes of a certain type, but if the tax on tires and tubes is doubled, it will be 18 percent, whereas the tax on other automobile parts and accessories will be only 5 percent. The 8.9 percent tax which already exists on tires and tubes is almost twice as heavy as the new tax will be on other automobile parts and accessories if it is double

We submit that no item of necessity such as tires and tubes should bear an excise tax as high as 18 percent. Apparently we shy away from even a small general manufacturers' sales tax and yet it is proposed to lay a tax of 18 percent on an item of strict necessity which many millions of people use to earn their living.

In this connection, it is worth pointing out that perhaps the most significant development that has taken place in the tire industry in many years is the recent rapid growth in the use of rubber tires on tractors and other farm implements. We do not believe that the tires which a farmer uses on machines and vehicles to plow his ground and to harvest his crop or haul it to market or which the laborer uses to go to his work should be subject to any higher tax than that which is levied on similar products. The rate on similar products is 2½ percent with a 5 percent proposed in the new bill. We submit that in logic and in fairness the rate on tires and tubes should not be 18 percent or should not be increased at all because it is already almost double the new rate on similar products.

Our case boils down to this. We started off on the wrong basis when these excise taxes were revived in 1932; our rate being almost four times as high ad valorem as on like products. Every time that excise taxes are increased by a flat rate, the inequality is broadened. As a matter of fact, the ad valorem equivalent on the weight tax on tires and tubes has been increased automatically over recent years because the weight and quality of the product have been increased much more rapidly than its price.

Put tires and tubes on the right basis, make the rate of their tax the same or approximately the same as the rate on similar products, then increase the tax by whatever flat rate is necessary, no matter how much, and the tire and tube manufacturers will pay this tax like good soldiers and without any argument.

The present method of assessing the tax on a pound basis has proved to be convenient from an administrative standpoint, both to the industry and to the Treasury Department and we recommend

that this method be kept, but that you do not raise the present pound rate and increase the tax disparity between tires and tubes and other comparable goods.

This tax has a bearing on one of our most acute agricultural problems, cotton. The tire industry of this country is the largest single user of American cotton in the world. The present price of cotton is about 17 cents a pound. The excise tax on tires 2½ cents a pound on total weight means that there is a tax of nearly 15 percent on all cotton used in tires. If the excise tax should be doubled, it would mean a tax of nearly 30 percent on all cotton consumed by the largest single user. There is no denying the fact that a tax this high places a penalty upon the cotton grower.

It has been suggested by some people that since crude rubber is a strategic material for which we are entirely dependent on imports an especially high tax on tires and tubes is advisable in order to conserve crude rubber. It has even been proposed that a tax of 20 percent be placed on all automobiles, parts, and accessories to throttle civilian use of the materials needed for defense.

It is perfectly true that crude rubber is a strategic material of which the Government is trying to build a stock pile as rapidly as possible and that steps have been taken by O. P. M. to conserve the use of rubber. We all know that defense needs come first in all products and that the use of essential material for automobiles, automobile parts, and accessories, or for anything else, must be controlled to whatever degree is required by the defense program. But we must remember that automobiles, tires and tubes, and other automobile parts are items of necessity. In effect, they are tools needed by the vast majority of our people in making their living. They are not luxury items. The automotive industry is one of the prime factors responsible for the tremendous economic strength of this country and any unnecessary brake placed on that industry would cause a profound adverse effect on our whole economy, would weaken instead of strengthen our defense effort.

Surely at a time when the cry is to preserve the democratic way of living, we are not proposing to conserve a product with which the mass of our people make their living, by jacking up the price. If we act on this principle, the people with plenty of money who want automobiles and tires for nonessential reasons could easily afford them, while the people who need them to earn their living might not be able to buy them. Now that the time has come to conserve rubber and other materials used in the automotive industry, should we not do it according to the use to which the products are to be put and not according to the ability to pay.

The argument that a heavy tax on tires and tubes and other automotive products would raise prices bears very close attention. One of the most important and most difficult problems the country has to cope with is to prevent an inflationary spiral of prices. The prices of all commodities, especially of necessities, are being watched with utmost care. Is it not obvious then that we should avoid any tax which automatically increased by 9 percent the manufacturers' cost of tires in a product that is indispensable to American business and the American public. Tires may not be in the forefront of our general price structure as prominently as some other items, such as steel

but they enter more vitally and more directly in the budget of the average person than steel and many other products and an unduly high tax on an item of necessity makes it more difficult to control inflation.

We submit the equities of the case dictate that the tax on tires and tubes be the equal and no more than the tax imposed on other automobile parts and accessories.

Other rubber products.—And this is a new imposition fixed by the bill passed by the House of Representatives——

Senator VANDENBERG (interposing). Before you reach that, Congressman, tell me how much is involved in this proposed increased tax. How much in total is involved?

Mr. HARTER. It would be double the present tax, which yields in the neighborhood of $40,000,000 annually.

Mr. HALLIGAN. About that, I would say, at present, but it would reach $60,000,000 or more, according to the volume involved.

Mr. HARTER. That is the excise tax on tires and tubes, and what I am going to speak of now is the tax that is imposed under the House bill upon rubber articles or rubber products.

Senator VANDENBERG. The House bill increased tires and tubes $30,000,000?

Mr. HARTER. Yes; it doubles the present excise tax rate on tires and tubes, and imposes an additional tax which is a new excise tax upon other rubber products.

Under section 3406 of the revenue bill of 1941 passed by the House of Representatives, a new excise tax is imposed on rubber articles described as follows:

> Articles of which rubber is the component material of chief weight, 10 per centum. The tax imposed under the paragraph shall not be applicable to footwear, articles designed especially for hospital or surgical use, or articles taxable under any other provision of this chapter.

We oppose this proposed tax on certain rubber products. It is totally unfair to single out one industry and saddle it with such a high percentage of the excise tax burden. The tax on tires and tubes increased as proposed in the House bill already represents ad valorem tax of almost 18 percent on these articles which constitute the principal volume product in the rubber-manufacturing industry. The imposition of a further tax on all other rubber products will result in a serious aggravation of the excise tax burden on the industry which is already out of proportion with comparable industries, both under the law as it is presently constituted and also under the proposed 100-percent increase. The total amount of tax which the bill seeks to impose on the rubber industry through the 10-percent tax on rubber products is estimated at $21,000,000 annually.

This sum is relatively small in relation to the total revenue to be obtained and it is doubtful whether even half of this amount would be actually realized because articles sold to the Government would be tax free and it would be found that many rubber articles would be exempt by reason of being taxed under other sections of the bill. The burden of administering this new excise tax will be both very heavy for the taxpayer as well as for the Government. It is therefore respectfully urged that this section be entirely eliminated from the bill as being

impractical of application and difficult and costly to administer. There is another serious objection to this proposed tax which will make its administration most difficult. The wording of the House bill is very ambiguous, restricting the tax to "articles of which rubber is the component of chief weight." It is not evident in the bill as to whether the House intended the word "rubber" to apply to crude rubber solely or to include synthetic rubbers and recailm from its scope.

There are over 30,000 articles covered by the rubber industry many of which should be taxable under the terms of the proposed bill and many others would not be taxable. On some articles one manufacturer would pay a tax and another manufacturer could sell the same product tax-free because of differences in manufacturing processes.

The rubber manufacturing industry as a whole is a progressive one and maintains large research staffs who are constantly experimenting to improve the quality of their product. As a result, the specifications for most of the products are constantly changing so that on one day a product may be taxable or subject to tax and the next day the same product would cease to be subject to tax.

In many cases, it will be impossible to determine whether some articles are taxable until they are ultimately consumed. An example of this is the material used for retreading tires. Under the regulations of the Revenue Bureau, if a tire is retreaded from bead to bead, completely obliterating the original markings and identity of the original tire, the retreaded tire is then subject to the full excise tax and the camelback or retreading material would not be taxable as a "rubber product." On the other hand, if the original markings on a tire are not obliterated in the retreading operation, the tire would not be subject to the excise tax on the tires, but the retreading material or camelback would be subject to the rubber-products tax.

Similarly, solid rubber tiring sold in lengths by rubber manufacturers to juvenile-vehicle manufacturers to be made into tires is subject to the excise tax on tires at the time the tiring is cut to the exact length necessary to form a tire at the vehicle manufacturer's plant. If it is not cut to length or not used on a juvenile vehicle, it would be subject to the rubber-products tax. Neither eventuality would be known to the rubber manufacturer at the time the goods are sold or shipped.

Competing articles manufactured by other industries are not similarly taxed which will result in placing rubber manufacturers at a serious disadvantage. The imposition of this tax will therefore result in causing the rubber industry customers to turn to substitutes, thus directly penalizing the industry, but in effect subsidizing its competitors.

For example, leather and fabric power-transmission belting, under the proposed revenue bill, may be sold tax free, while rubber belting, including agricultural belting, will be subject to tax when the rubber content exceeds the other ingredients by weight. Oilskin raincoats and clothing, oilcloth, and linoleum will be sold free of tax, while their competitive products made of rubber, such as rubber raincoats and clothing and rubber flooring, will be subject to tax.

It would be impossible to enumerate many of these thousands of articles manufactured largely of rubber and which would be taxable under the provision included in the House bill. For instance, there

is an extensive manufacture of rubber toys of all kinds and descriptions, including toy balloons. Due to lack of importations from Japan, Germany, and England in recent years, the rubber-toy industry has taken on greater volume and importance in the United States. It would be a gross injustice to tax the products of this rubber-toy industry, which is in competition with toys made of metal, plastic, glass, wood, and other materials. The same argument, of course, holds good with reference to a myriad of rubber products, which are in daily competition with commercial counterparts usable for like purposes, upon which this bill imposes no tax whatsoever.

According to the wording of the House bill, the tax imposed does not apply to footwear. We assume this exception was taken as rubber footwear is an article of clothing. If footwear be accepted on these grounds, rubber clothing of all types should also be excepted as articles of necessity in the family budget of the American public generally.

Again the term "footwear" is not complete unless it includes the shoe bottom. Therefore it is submitted that rubber heels and soles, soling slabs, and top lift strips should be specifically exempted from application of excise tax, both when used in the manufacturing of new shoes and the repair of worn shoes. It is a fact that rubber heel and sole products are used in the production of types of shoes which are used extensively by farmers, workmen, and people in the low-income brackets.

Undoubtedly it will be necessary to specify the "articles designed especially for hospital or surgical use" which are to be exempted from the new excise tax. As an aid to your committee in doing so, and to enable it most clearly to visualize the probable scope of this intended exemption, we should like to submit a list of such articles which, in the opinion of the industry, is quite complete.

I might say that that list has been made up and will be handed to the reporter for the purpose of the record.

(The list referred to is as follows:)

EXHIBIT A.—*List of articles exempt because especially designed for hospital or surgical use*

Accessories.
Atomizer bulbs.
Attachment sets.
Babies' water bottles.
Bath sponges.
Bath sprays.
Bottles, water.
Breast forms, sponge rubber.
Breast pumps.
Bulb syringes.
Caps, nursing-bottle.
Catheters.
Colon tubes.
Colostomy outfits.
Combinations, syringe.
Comfort cushions.
Compacto.
Cots, light-weight.
Crutch tips.
Cushions, invalid.
Cushions, operating.
Douches, vaginal.
Droppers, medicine.
Ear syringes.
Electrosheet.
Face bottles.
Finger cots.
Fittings.
Flat goods.
Gloves, obstetrical.
Gloves, surgeons'.
Hard rubber pipes.
Hard rubber syringes.
Hospital standard line.
Hot-water bottles.
Ice caps.
Infant syringes.
Invalid cushions.
Laboratory stopples.
Medicine droppers.
Nipples, nursing-bottle.
Obstetrical gloves.
Orthopedic devices.
Packette.
Penrose tubing.
Pessaries.
Pile pipes.
Pipes, hard rubber.
Rectal syringes.
Rectal tubes.
Serum stopples.
Sheeting, hospital.
Stomach tubes.
Stopples, laboratory and serum.
Surgeons' gloves.
Syringes, bulb:
  Combination.
  Ear.
  Fountain.

Syringes, bulb—Continued	Tissue cots.	Tubes, celon:
Hard rubber.	Throat bags.	Rectal.
Infant.	Tubing, surgical.	Stomach.
Vaginal.	Tubing, penrose.	Urinals:

It is undoubtedly evident to you that the "other rubber products" embraced by section 3406 of the House bill includes many articles which are definitely of a defense and semidefense nature such as conveyor and power transmission belting, air, water, steam, welding, oil, gasoline, and other types of hose in particular fire hose for general fire-protection service. These so-called mechanical or industrial rubber goods and hard rubber goods are essential to the operation of key industries that are definitely of a defense character—food and kindred products; textile mill and other fiber manufactures; apparel and other finished products made from fabrics; lumber and timber; chemicals, petroleum; coal; steel; electrical machinery; all forms of transportation; all types of mining operations; and others too numerous to mention. The question naturally arises whether it is the wish of Congress to impose an additional 10 percent burden on all of these essential defense industries.

We must emphasize the point that the rubber manufacturing industry appears to have been singled out for taxation in this proposed bill. There does not appear to be another essential industry, other than automobiles, that would be subject to the contemplated taxation and entirely aside from our statement with respect to the proposed rates on tires and tubes, we again make the point that under the proposed bill industrial rubber goods of highly essential character would be involved.

We submit that the excise tax as proposed in section 3406 of H. R. 5417 as written is unfair to the industry and too impractical to administer and works an undue hardship on the industry as compared with other industries.

I might say that I have here a few articles that I would like to hand to the chairman and members of the committee which illustrate how difficult is going to be the fair manner of the imposition of this tax and the fact that articles which have slightly less than 50 percent content of rubber will be in competition with those that contain more than 50 percent, or 50 percent or more under the House bill, so it will result in the most unfair competition.

These are camel-backs [indicating] or the rubber strips that are used for the retreading of tires. One contains more than 50 percent of rubber and one less.

Here are two types of rubber backing, one of which contains in excess of 50 percent and the other less [indicating].

These are samples of conveyor belting, one of which would be taxable and the other would not [indicating].

Senator VANDENBERG. Was this viewpoint presented to the House Ways and Means Committee?

Mr. HARTER. The viewpoint with reference to excise tax was presented to the House Ways and Means Committee. At that time, we did not know that the 10 percent tax was to be imposed upon rubber products, so the presentation of the latter part was not made to the House Ways and Means Committee.

Senator VANDENBERG. By the way, the figure we were discussing previously as to the increased revenue from the new tax on tires and

tubes is estimated in the House report at $44,600,000, rather than $30,000,000.

Mr. HARTER. It ran in my mind that the tax raised, under the present rate, some $39,000,000 or $40,000,000.

Senator GUFFEY. Mr. Harter, was this suggested by the House committee itself, or the Treasury Department?

Mr. HARTER. Senator, I am unable to answer that. I do not know. I know for a number of years when revenue bills have been up, the matter has been laid before the Ways and Means Committee as to the inequity of the excise tax upon tires and tubes as compared with other automotive accessories and parts. We felt, for many years, it was most unfair that this particular accessory, because certainly tires and tubes are accessories, should bear the unfair proportion of tax that has been their burden under the acts in recent years.

Senator VANDENBERG. Well, to meet the entire difficulty which you pyramid into a rather staggering proposition, would not you have to fall back on the general manufacturers' sales tax as far as your theory is concerned?

Mr. HARTER. Either that or see that all excise taxes, particularly with reference to the automotive products, were placed on a fair, equitable, and reasonable basis.

Senator VANDENBERG. Of course, I thoroughly sympathize with your fundamental point of view that the automotive industry and related parts is a traditional goat when it comes to the tax policy of the Government.

Mr. HARTER. And the rubber industry, even to a greater extent than other kindred automotive manufacturers.

Mr. Chairman, I want to thank you for the courtesy of appearing first, as the House is in session. Are there any further questions?

The CHAIRMAN. Are there any questions that any member of the committee wants to ask? Mr. Halligan, is there any statement that you wish to make?

Mr. HALLIGAN. No; I have nothing to add to the statement that we aided in preparing.

The CHAIRMAN. Thank you.

Mr. HARTER. Thank you very much.

The CHAIRMAN. Mr. Satterlee.

STATEMENT OF HUGH SATTERLEE, NEW YORK, N. Y., CHAIRMAN, COMMITTEE ON TAXATION, NEW YORK COUNTY LAWYERS ASSOCIATION

Mr. SATTERLEE. My name is Hugh Satterlee. I am chairman of the committee on taxation of the New York County Lawyers Association. On behalf of the committee on taxation and on behalf of the New York County Lawyers Association, I should like to submit a statement involving the subject of joint returns of husband and wife. This was prepared before the provision was eliminated from the House bill but, inasmuch as the subject may be revived, I should like to file this statement and have it considered in that event, although I see no present need for asking you gentlemen to listen to any oral statement on that subject so, if agreeable, I should like to file copies of this statement with the clerk.

The CHAIRMAN. That is agreeable, Mr. Satterlee. Do you wish it printed in the record?

Mr. SATTERLEE. I think it may be well worth while. We have spent some time on the law on the subject.

The CHAIRMAN. It will be printed in the record. You may file a copy with the reporter or the clerk.

Mr. SATTERLEE. There are two other matters on which I would like to speak briefly, although, as I have no formal authorization from the association, I am really speaking as an individual.

One involves a proposed amendment to the personal holding company provisions. The personal holding company provisions of the statute which, as you will recall, were first enacted in 1934, were plainly designed to compel the distribution of earnings of that class of companies, as indeed was the undistributed profits tax under the 1936 act. However, by the 1937 amendment to the 1936 act, an error—which I think was an error—occurred which resulted in very great injustice. I can illustrate briefly by giving you an actual example with figures.

The B corporation, with a capital deficit on January 1, 1937, had taxable net income for 1937 of $34,000, received from interest and dividends, but, because of losses in excess of $100,000 on the sale of capital assets, it naturally had a larger capital deficit on December 31, 1937, and no earnings or profits of the taxable year. During 1937 it distributed to its stockholders $36,000, which the corporation treated as dividends paid and which the stockholders treated as taxable income and reported as such in their returns. Nevertheless this corporation, which realized losses for the year greater than its gains, but even so distributed $36,000 to stockholders, is taxable not only as to the normal tax, but also as to the undistributed-profits surtax and as to the personal holding-company surtax, resulting in Federal taxes of over $30,000, or 88 percent of its technical taxable net income. If the corporation had suffered no losses for 1937 its tax would have been less than $1,000 instead of $30,000.

That was the purpose of the statute. However, in a case where a corporation, as did this corporation, had losses, capital losses substantially in excess of its net income it, under the then interpretation of the word "earnings," had no earnings for the year; and therefore, although $36,000 was actually distributed and the tax paid on such distribution by the stockholders, it was not regarded as a dividend out of earnings. The corporation having had no accumulated profits prior to that year it was not entitled to a dividends-paid credit, and the corporation was taxed not only with the normal tax but also with the personal holding-company tax and undistributed-profits tax amounting to over $30,000. So that on a new income, technical net income which involved net earnings because of the losses, and although it distributed more than its net income the corporation was really taxed on its losses almost to the entire extent of its net income.

Now, that matter has been brought to the attention of the Treasury Department and it has assured a number of lawyers who are interested in that question that it realized that an injustice was done and that if called upon it would recommend an amendment to take care of that situation.

Without imposing upon your time further as to that, I should like to file a letter in which I set forth a proposed amendment to the income-tax provisions of the present bill which I think would

cover the situation, but I am informed, as I said, that the Treasury Department has an amendment of its own which it would recommend if called upon for the submission of such an amendment.

The CHAIRMAN. You may file your letter so we may bring it to the attention of the Treasury.

(The letter referred to is as follows:)

SATTERLEE & GREEN,
New York, N. Y., August 11, 1941.

Hon. WALTER F. GEORGE,
Chairman, Committee on Finance, Senate Office Building,
Washington, D. C.

DEAR SIR: To correct an admitted injustice which has existed since the amendment of the Revenue Act of 1936 by the Revenue Act of 1937, I respectfully propose the insertion at the end of title I of the revenue bill of 1941 of the following provision:

"Section 356 of title IA of the Revenue Act of 1936, as added by title I of the Revenue Act of 1937, amending section 351 of title IA of the Revenue Act of 1936; section 406 of the Revenue Act of 1938; and section 505 of the Internal Revenue Code as amended by the Revenue Act of 1939, are amended by inserting at the end thereof the following subdivision:

"*Payment of surtax on pro rata shares.*—The tax imposed by this title or subchapter shall not apply if (1) all the shareholders of the corporation include (at the time of filing their returns) in their gross income their entire pro rata shares, whether distributed or not, of the adjusted or title IA or subchapter A net income of the corporation for such year, and (2) 90 percent or more of such net income is so included in the gross income of shareholders other than corporations. Any amount so included in the gross income of a shareholder shall be treated as a dividend received. Any subsequent distribution made by the corporation out of earnings or profits for such taxable year shall, if distributed to any shareholder who has so included in his gross income his pro rata share, be exempt from tax in the amount of the share so included.

"This amendment shall apply with respect to taxable years beginning after December 31, 1936."

I am assured that the Treasury Department favors such a provision, which was included with respect to corporate surtaxes in all revenue acts (except 1924) from 1921 to 1936, but was omitted in the 1937 revision of the 1936 act on the mistaken assumption that the same result was achieved by the provision for a dividends paid credit.

To prevent the imposition of the surtax on undistributed profits where the shareholders reported and paid taxes on distributions from the corporation which, although representing "net income" to it, were not out of "earnings," a similar provision should be added to section 14 or section 27 (h) of the Revenue Act of 1936; and section 28 (c) of the Revenue Act of 1938 and of the Internal Revenue Code might be amended so as to eliminate the words enclosed in brackets, as follows:

"There shall be allowed to the corporation, as a part of its basic surtax credit for the taxable year, a consent dividends credit equal to [such portion of] the total sum agreed to be included in the gross income of shareholders by their consents filed under subsection (d) [as it would have been entitled to include in computing its basic surtax credit if actual distribution of an amount equal to such total sum had been made in cash and each shareholder making such a consent had received, on the consent dividends day, the amount] specified in the consent."

I understand that the Treasury Department has prepared a recommendation for amendments designed to achieve the same result as the foregoing, and I respectfully suggest that it be requested to submit such recommendation.

Yours very truly,

(Signed) HUGH SATTERLEE.

Mr. SATTERLEE. The other point I have is this: Under the excess-profits tax amendments of 1941 there was added section 734 to the excess-profits tax law by section 11 of the 1941 act, and I notice by this morning's paper that Mr. Blodgett, of Boston, discussed that subject before you yesterday (see p. 140), but I should like to add a word on that.

The effect of that section 734 is, in the first instance, to remove the bar of the statute of limitations so far as the Government is concerned, but without helping the taxpayer. It goes even further than that. The second effect that it has is the one which I think is unfair, and which should be eliminated by an amendment.

In the case of a transaction, we will say, that took place in 1930, where property was transferred to a taxpayer by another corporation, under the law as it stood, then in certain circumstances it made no difference to the transferee corporation whether or not that was a nontaxable transfer so far as the transferor corporation was concerned. So that, so far as the transferee was concerned, it derived no benefit from the transferor attempting to shape the transaction in such form that it would be nontaxable as to it. Since then, however, the law has been changed as to basis, so that the basis of the transferee would be better, would be higher, if that were a taxable transaction than if it had been a nontaxable transaction, and the courts have decided in situations such as those I have in mind that it was a taxable transaction so far as the transferor was concerned.

Now, this section 734 provides in effect that if——

Senator CONNALLY. Let me ask you right there: You mentioned the transfer of property. They transferred all the assets of the corporation?

Mr. SATTERLEE. Yes.

Senator CONNALLY. All right. Thank you.

Mr. SATTERLEE. Now, however, section 734 provides this drastic thing: It says that if the transferee now wants to claim that its basis is higher, that that was a taxable transaction even though at the time it was made it made not the slightest difference to it whether it was taxable or nontaxable. If it now takes that position, and that is a correct position under the law as held by the courts, it would make itself subject not to any tax which it avoided by the original form of the transaction but to the entire tax which the transferor would have had to pay if at the time that the transaction occurred it had been held to be a taxable transaction. In other words, the transferee is called upon not to assume now a burden which it justly should have assumed at the time of the transaction on the basis of the claim it is now making, but it is compelled to pay a tax which, under no view of the law, would it ever have been compelled to pay. That is the part of the section which it seems to me is extremely unfair, and, in fact, vicious. It compels a transferee at the present time, who has derived no benefit from a form in which a transferor has shaped a particular transaction, to pay the transferor's tax, although that, of course, has long since been barred by the statute of limitations.

The CHAIRMAN. That is the result of changing position?

Mr. SATTERLEE. That is the result of changing position. But, as a matter of fact, as I said to start with, inasmuch as the form of the transaction at the time it was consummated had no effect one way or another on the transferee, the transferee is not really changing its position, because it was a matter of indifference to it. It needed to take no position at that time at all, it was only the transferor's position claimed at that time that the transferee is now saying was erroneous.

The CHAIRMAN. In other words, in your case, in the case that you are presenting, it is rather the taking of the position in the first instance, actually taking a position in the first instance.

Mr. SATTERLEE. That is correct. It never took any position previously, because it did not need to take any position.

The CHAIRMAN. But technically it does take that position now, and in that particular instance, the property transferred from one corporation to another back in 1930, it assumes the liability of the predecessor?

Mr. SATTERLEE. The predecessor, not in the sense that it was the successor corporation but it was simply a transfer in part of a then still existing corporation's property to it. So that the predecessor, so-called, is still in existence, but its liability has been barred by the statute of limitations, and that liability is now, by the statute, saddled upon the transferee as a condition for it taking a position which the law entitles it to take.

Senator WALSH. Mr. Chairman, I think the Treasury should be asked to make a report on the objections made by Mr. Satterlee and Mr. Blodgett on this section.

The CHAIRMAN. I think we will call on the Treasury to do that. We will let them know. That is section 734. We would like to have the Treasury examine the testimony of Mr. Satterlee and the testimony of Mr. Blodgett on yesterday and then give us the advantage of a report on it.

Mr. SATTERLEE. In anticipation of the criticism which may be made against what I said, that it does not help to increase the taxes, as a matter of fact, it would, to an insignificant degree possibly, reduce the revenue, I should like to add that the last speaker's discussion made me think that it might be well to add that ever since 1920, when I was converted to the principle of a general sales tax, I have been very much in favor of a general sales tax as complementary to the income tax.

In my opinion, and for what little it may be worth, I have for over 20 years devoted most of my practice to tax matters. I believe that a great many of the inequities of the income tax which cannot be avoided, and a great many objections to the general sales tax which I believe exist to a lesser extent than is commonly supposed, would offset each other if the two taxes were combined. I think, for example, that the proposed possibility, which I believe is now under discussion, of lessening exemptions so as to subject to income-tax people, individuals with much smaller incomes than are now taxed, that that could be avoided and yet the same result of spreading, of widening the base of taxation could be achieved by a general sales tax, which would also obviate some of the inequities that the last speaker has mentioned, as existing in the case of the rubber industry.

It seems to me that if there were imposed a general turn-over sales tax at a low rate, it would solve a great many of the difficulties that you gentlemen are now facing.

Back early in the 1920's or earlier, when general sales taxes were first proposed, the economists and others said, among other things, that a sales tax was very inequitable and it could not be thought of in connection with a single State or single city for example. Since then, as we know, a number of States have adopted sales taxes which

have not proved unduly burdensome. Even cities have done so. In the city of New York we have a sales tax which is more or less annoying, but I have not heard of anyone who considers it really burdensome.

Senator CONNALLY. Is not the argument against a sales tax that the States and cities have already levied them? Do you want to levy another one on top of it?

Mr. SATTERLEE. I said a number of States have levied them and some cities. I doubt if many cities have levied them but if a general sales tax were imposed by the Federal Government it might be that the States and cities could be provided for in some other way, or encouraged to abandon them.

Senator BARKLEY. In other words, your theory is that the Federal Government ought to invade all the sources of revenue possible and let the cities and States scramble around the best they can to raise revenue for their own purposes?

Mr. SATTERLEE. I remember some years ago, Senator, that the proposition was very largely advocated that estate taxes should be left to the States, and that the Federal Government should eliminate any estate taxation from its taxing system. Of course, that idea has had to be abandoned. Of course, the States and localities now have the general property taxes, and a good many States too, have adopted income taxes, as has the State of New York, for example.

Senator BARKLEY. We may have to come to a general sales tax. I am not closing the door to it, but it seems to me we ought not to do it until we have to.

Mr. SATTERLEE. Well, it seems to me that with the increasing number of these special excise taxes, which, of course, are sales taxes, and the differences in rates, that before very long, even without meaning to, there will be so many articles taxed that you will have, in effect, a general sales tax with the disadvantages of differing rates which it would be, I should say it is impossible to work out to absolute fairness in every case, and yet without the ease of administration which would come from imposing a low rate of tax on practically all articles. A tax of 10 percent on a specific article is, of course, a burden not only on the manufacturer, the retailer, or whomever the tax is imposed upon, but also on the purchaser, but a tax of 2 percent or 1 percent on every article, whatever inequity there is, is pretty much smoothed out by the fact that the size of the tax, the rate of the tax is so small.

Senator BYRD. May I ask you a question right there?

Mr. SATTERLEE. Surely.

Senator BYRD. You just spoke of a tax on every article. Do your studies convince you that the sales tax should be all-inclusive, or should you exempt food, clothing, medicine, and fuel, which are so-called necessities?

Mr. SATTERLEE. Well, Senator, I have not made, in the last year or two, any renewal of studies on the sales tax. As a matter of fact, most of the work I did on the sales tax was 10 years or so ago. I would not have any positive opinion as to that. It seems to me that the rate of the tax has a good deal to do with it. I cannot conceive that a tax of 1 percent, for example, on food would be a very serious

matter. Quite possibly, however, that could be done, and possibly some other articles which, for instance, are not consumable, or do not go into the final possession of the purchaser, but which are sold and resold could have some special provision.

For example, stocks and bonds. It would be rather difficult to impose a sales tax on every sale of those, because it would practically deter people from making reinvestments.

Senator BYRD. What would you say as to articles, for example, that are being sold at one point and then later go into the manufactured article? Would your plan be for a manufacturer's sales tax as to those articles?

Mr. SATTERLEE. Personally, I am very much in favor of a straight turn-over tax at a low rate. Of course, there is argument against that, which I think is offset by making it a very low rate. However, that could be handled too, as has been suggested in the past, in the case of every subsequent sale by taxing only the proceeds from that subsequent sale in excess of the cost of the article or material on which a tax has already been imposed.

Senator BYRD. What machinery have you had in mind? Would you collect it at the source? You would not attempt to collect a retail sales tax, would you? Because that is the system most of the States have.

Mr. SATTERLEE. You mean, whether it should be imposed on the consumer, on the purchaser?

Senator BYRD. I mean the method of collection. For instance, in a manufactured article, would you collect it from the manufacturer or the retailer?

Mr. SATTERLEE. I would collect it from the seller.

Senator BYRD. In other words, you would collect it on the wholesale price?

Mr. SATTERLEE. Yes.

Senator BYRD. Not on the retail price?

Mr. SATTERLEE. Well, on the wholesale price and then again on the retail price, subject to this possible provision which I just mentioned of giving the retailer the credit for what the article cost him.

Senator GERRY. Don't you terminate with the tax on the retailer if you do that?

Mr. SATTERLEE. You would if you had a high rate of tax. I think the researches which were made some time ago—as I said, I am rather rusty on it—show that the average amounts to 4 percent.

Senator BYRD. Your plan is somewhat similar then to the gross sales tax, is it not?

Mr. SATTERLEE. Quite similar; yes.

The CHAIRMAN. Thank you very much.

(The statement submitted by Mr. Satterlee is as follows:)

NEW YORK COUNTY LAWYERS' ASSOCIATION,
COMMITTEE ON TAXATION,
August 1, 1941.

Hon. WALTER F. GEORGE,
Chairman, Committee on Finance, Senate Office Building,
Washington, D. C.

DEAR SIR: The provision in H. R. 5417, as reported by the Committee on Ways and Means of the House of Representatives, for requiring a joint return of the separate incomes of husband and wife, in our opinion seriously violates

established principles of constitutional law and sound theory of income taxation, as well as precipitating grave social questions. As lawyers we address ourselves to the legal issues.

I. *The provision for the taxation of the combined income of husband and wife, as though it were the income of one person, violates the fifth amendment to the Constitution of the United States in that it would deprive the taxpayer of his property without due process of law.*

The sixteenth amendment provides that "The Congress shall have power to lay and collect taxes on incomes, from whatever source derived, without apportionment among the several States, and without regard to any census or enumeration." The tax contemplated by this amendment is a tax levied upon the recipient of income, based and computed upon the amount of income received by him, and not a tax levied upon the recipient of income based and computed upon income received by some other person. The latter proposition is what the bill attempts. It levies a tax upon the husband based and computed upon the income and property of the wife.

This practice has been heretofore condemned by the Supreme Court. In *Knowlton* v. *Moore* (178 U. S. 41), the Supreme Court held that a tax levied upon separate legacies or distributive shares could not be measured by the amount of the whole estate. The Court there said on page 77:

"It may be doubted by some, aside from express constitutional restrictions, whether the taxation by Congress of the property of one person, accompanied with an arbitrary provision that the rate of tax shall be fixed with reference to the sum of the property of another, thus bringing about the profound inequality which we have noticed, would not transcend the limitations arising from those fundamental conceptions of free government which underlie all constitutional systems."

A State law similar to the proposed statute has been held by the Supreme Court to be unconstitutional (*Hoeper* v. *Tax Commission of Wisconsin*, 284 U. S. 206). In that case a statute of the State of Wisconsin provided:

"SEC. 71.05 (2) (d): '* * * In computing taxes and the amount of taxes payable by persons residing together as members of a family, the income of the wife and the income of each child under eighteen years of age shall be added to that of the husband or father, or if he be not living, to that of the head of the family and assessed to him except as hereinafter provided. The taxes levied shall be payable by such husband or head of the family, but if not paid by him may be enforced against any person whose income is included within the tax computation.'

* * * * * * *

"SEC. 71.09 (4) (c): 'Married persons living together as husband and wife may make separate returns or join in a single joint return. In either case the tax shall be computed on the combined average taxable income. The exemptions provided for in subsection (2) of § 71.05 shall be allowed but once and divided equally and the amount of tax due shall be paid by each in the proportion that the average income of each bears to the combined average income.'"

The Supreme Court in the *Hoeper case* set forth all the various rights and privileges accorded to married women under the laws of Wisconsin, including the right to hold and convey property, and then went on to say:

"Since, then, in law and in fact, the wife's income is in the fullest degree her separate property and in no sense that of her husband, the question presented is whether the State has power by an income-tax law to measure his tax, not by his own income but, in part, by that of another. * * *

"We have no doubt that, because of the fundamental conceptions which underlie our system, any attempt by a State to measure the tax on one person's property or income by reference to the property or income of another is contrary to due process of law as guaranteed by the fourteenth amendment. That which is not in fact the taxpayer's income cannot be made such by calling it income. * * *"

The Tax Commission attempted to justify the tax upon the ground that it was necessary in order to prevent frauds and evasions of the tax by married persons. The argument, the Court held, was answered in the case of *Schlesinger* v. *Wisconsin* (270 U. S. 230), where it was said:

"That is to say, 'A' may be required to submit to an exactment forbidden by the Constitution if this seems necessary in order to enable the State readily

to collect lawful charges against 'B.' Rights guaranteed by the Federal Constitution are not to be so lightly treated; they are superior to this supposed necessity. The State is forbidden to deny due process of law or the equal protection of the laws for any purpose whatsoever."

The second argument urged by the Tax Commission as a justification for the tax was that it was a regulation of marriage, something directly within the power of the State to do. This argument was answered by the Court when it said,

"Again, it is clear that the law is a revenue measure, and not one imposing regulatory taxes * * *. It is obvious that the act does not purport to regulate the status or relationships of any person, natural or artificial. Arbitrary and discriminatory provisions contained in it cannot be justified by calling them special regulations of the persons or relationships which are the object of the discrimination * * *."

Perhaps the gist of the entire opinion is found in the following quotation from the opinion at page 217:

"* * * the State has, except in its purely social aspects, taken from the marriage status all the elements which differentiate it from that of the single person. In property, business, and economic relations they are the same. *It can hardly be claimed that a mere difference in social relations so alters the taxable status of one receiving income as to justify a different measure for the tax.*" [Italics ours.]

The Court then concluded:

"Neither of the reasons advanced in support of the validity of the statute as applied to the appellant justifies the resulting discrimination. The exaction is arbitrary and is a denial of due process."

It would seem, therefore, that the *Hoeper case* answers the question of the constitutionality of the proposed statute. Although that case involved a State statute, it is settled that there is no distinction between the "due process" of the fourteenth amendment and the "due process" of the fifth amendment (*Heiner* v. *Donnan*, 285 U. S. 315). That which is a violation under the one is a violation under the other. The mere fact that the proposed statute is a Federal law, and that the statute involved in the *Hoeper case* was a State law cannot change the finding that the statute is a "discrimination," "is arbitrary," and "is a denial of due process."

The *Hoeper case* does not stand alone in its condemnation of a tax upon "A" based upon the property of "B." In the case of *Schlesinger* v. *Wisconsin*, *supra*, the Supreme Court held that a statute of the State of Wisconsin, which included within the estate of a decedent all gifts made within 6 years of the time of the decedent's death, was arbitrary and in plain conflict with the fourteenth amendment.

In *Frew* v. *Bowers* (12 F. (2d) 625, C. C. A. 2d) the Government contended that a Federal statute was to be interpreted as including within the estate of a decedent property which had been irrevocably transferred to a trust 12 years prior to decedent's death. Justice Hand, in a concurring opinion, after pointing out that this property at the time of decedent's death belonged to the trust and not to the decedent, stated at page 630:

"Such a law is far more capricious than merely retroactive taxes. Those do indeed impose unexpected burdens, but at least they distribute them in accordance with the taxpayer's wealth. But this section distributes them in accordance with another's wealth; that is a far more grievous injustice."

The practice was again condemned in the case of *Heiner* v. *Donnan* (285 U. S. 315), where the statute involved in effect created an irrebuttable presumption that gifts made within 2 years of the death of the donor were made in contemplation of death. The Court there said:

"The result is that upon those who succeed to the decedent's estate there is imposed the burden of a tax, measured in part by property which comprises no portion of the estate, to which the estate is in no way related, and from which the estate derives no benefit of any description. Plainly, this is to measure the tax on A's property by imputing to it in part the value of the property of B, a result which both the *Schlesinger* and *Hoeper cases* condemn as arbitrary and a denial of due process of law. Such an exaction is not taxation but spoliation. 'It is not taxation that Government should take from one the profits and gains of another. That is taxation which compels one to pay for the support of the Government from his own gains and of his own property.'

(*United States* v. *Baltimore & O. R. Co.*, 17 Wall. 322, 326, 21 L. Ed. 597, 599)."

If it be argued that the statute does not tax A upon the income of B, as appears to be unconstitutional, then it must be argued that the income of B belongs to A. The statute in effect, therefore, raises an irrebuttable presumption that the income of the wife belongs to the husband and the income of the husband belongs to the wife. This procedure has likewise been condemned by the Supreme Court. In *Reinecke* v. *Smith* (61 F. (2d) 324, 325) the Court said:

"Under the broadest conception of legislative power, that which is not the income of the taxpayer and which it is impossible for him to make a part of his income may not be required arbitrarily to be included in his income. Such an attempt amounts to confiscation and offends the fifth amendment."

In *Darcy* v. *Commissioner* (66 F. (2d) 581, 585) the Court said:

"We agree that what is not income in fact cannot be made income by legislative fiat and so brought within the income-tax laws."

In *Helvering* v. *City Bank Farmers Trust Co.* (296 U. S. 85) the Court stated:

"A legislative declaration that a status of the taxpayer's creation shall, in the application of the tax, be deemed the equivalent of another status falling normally within the scope of the taxing power, if reasonably requisite to prevent evasion, does not take property without due process. But if the means are unnecessary or inappropriate to the proposed end, are unreasonably harsh or oppressive, when viewed in the light of the expected benefit, *or arbitrarily ignore recognized rights to enjoy or to convey individual property, the guaranty of due process is infringed.*" [Italics supplied.]

The cases of *Hoeper* v. *Tax Commission of Wisconsin*, and *Heiner* v. *Donnan*, *supra*, are again in point. The Court in the *Hoeper case* stated, at page 215:

"That which is not in fact the taxpayer's income cannot be made such by calling it income.

"* * * Under the law of Wisconsin the income of the wife does not at any moment or to any extent become the property of the husband. He never has any title to it, or controls any part of it. That income remains hers until the tax is paid, and what is left continues to be hers after that payment. The State merely levies a tax upon it. What Wisconsin has done is to tax as a joint income that which under its law is owned separately and thus to secure a higher tax than would be the sum of the taxes on the separate incomes."

What the Wisconsin Legislature did there, and what the proposed legislation herein under consideration would effect, are the same thing, viz, raising an irrebuttable presumption as to the recipient of the income. This is clearly in violation of the fifth amendment, as it deprives the taxpayer of his property without due process of law.

In the *Heiner case*, *supra*, the Court in speaking of the statute imposing an irrebuttable presumption of contemplation of death upon gifts made within 2 years of death, said:

"The presumption here excludes consideration of every fact and circumstance tending to show the real motive of the donor. The young man in abounding health, bereft of life by a stroke of lightning within 2 years after making a gift, is conclusively presumed to have acted under the inducement of the thought of death, equally with the old and ailing who already stand in the shadow of the inevitable end. And although the tax explicitly is based upon the circumstance that the thought of death must be the impelling cause of the transfer * * * the presumption, nevertheless, precludes the ascertainment of the truth in respect of that requisite upon which the liability is made to rest, with the result, in the present case and in many others, of putting upon an estate the burden of a tax measured in part by the value of property never owned by the estate or in the remotest degree connected with the death which brought it into existence. Such a statute is more arbitrary and less defensible against attack than one imposing arbitrarily retroactive taxes, which this court has decided to be in clear violation of the fifth amendment."

As in the *Heiner case*, the presumption here excludes consideration of every fact and circumstance tending to show the real destiny of the income. The husband, whose wife's income is used for purposes entirely removed and dissociated from the marital relationship, is conclusively presumed to have beneficially received the income, equally with the husband whose wife turns

over her weekly pay envelope to him to be expended for the upkeep of the family home. And although the tax is based upon the taxpayer receiving income, either actually or beneficially, the presumption precludes the ascertainment of the truth in respect of that requisite upon which the liability is made to rest, with the result of taxing income to one who has never, either actually or beneficially, received it.

II. *The provision for taxing separate incomes as joint income would effect an unconstitutional usurpation of the States' power to regulate property*

The proposed statute in effect would state that one of the incidents of the ownership of property by a married person is that the spouse of such person shall be taxed thereon. This is an assumption of the power of the State to regulate the ownership of property and, under the tenth amendment, is unconstitutional.

The tenth amendment to the Constitution reads:

"The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people."

The power to regulate property has long been a recognized right of the States. It was not delegated to the Federal Government by the Constitution and thus has remained, since the birth of our country, within the orbit of State control. The proposed satute would result, therefore, in usurping this power by the Federal Government.

In *Hoeper* v. *Tax Commission of Wisconsin* (284 U. S. 206), which held that a Wisconsin statute imposing compulsory joint income-tax return for husband, wife, and children under 18 years of age, was unconstitutional, Justice Holmes wrote a dissenting opinion which was concurred in by Justice Brandeis and (now Chief Justice) Stone. His opinion was based upon the premise that the States had inherent power to regulate property and that since the State of Wisconsin had been the one to grant to married women the right to hold and convey property, in contravention to the common law upon the subject, the State likewise had the power to curtail this right in any manner in which it saw fit. It held that, by the enactment of the statute there in question, the Sate was exercising is right to regulate property.

It can be seen, therefore, that even if one grants the reasoning of the dissent in the *Hoeper case* to be correct, the proposed statute would still be unconstitutional under the tenth amendment because of its usurpation of the State's power to regulate property.

Justice Holmes in the *Hoeper case* dissent said, at page 220:

"So far as the Constitution of the United States is concerned the legislature [State] has power to determine what the consequences of marriage shall be, and as it may provide that the husband shall or shall not have certain rights in his wife's property and shall or shall not be liable for his wife's debts, it may enact that he shall be liable for taxes on an income that in every probability will make his life easier and help to pay his bills * * *."

Again granting this to be true, what has been stated above in regard to the power to regulate property is equally applicable to the power to regulate marriage. This is also a power which was not delegated to the Federal Government and hence was reserved to the States. If the proposed statute be interpreted then as a regulation and consequence of marriage, it is likewise a usurpation of the States' power.

III. *"Incomes," as used in the sixteenth amendment, never contemplated the inclusion of a wife's income in her husband's taxable income*

The sixteenth amendment states:

"The Congress shall have power to lay and collect taxes on incomes, from whatever source derived, without apportionment among the several States, and without regard to any census or enumeration."

A definition of income, as contemplated by the sixteenth amendment, was set forth in *Eisner* v. *Macomber* (252 U. S. 189), which has often been quoted and reaffirmed. It states:

"Income may be defined as the gain derived from capital, from labor, or from both combined, provided it be understood to include profit gained through a sale or conversion of capital assets, * * *."

It is clear, therefore, that in order for property to be taxable as "income," it must fall within this definition.

Assuming, now, that one spouse receives a beneficial advantage from the income of the other spouse, how is this interest acquired? There is no valuable consideration which is paid for it. A husband and wife who have a single income are just as much bound and morally obligated to each other as the husband and wife who have two incomes. And a wife who has been working is entitled to no less from her husband when she ceases to work. In other words, then, when a man and woman enter into marriage, they assume certain duties and obligations toward each other. If subsequently, one or the other acquires an income which theretofore had not existed, the obligations and duties of the other spouse are in no way increased, even though a beneficial interest in the new income is acquired. Nothing is given in return for this income and there are not any new promises made. The new interest is acquired without the payment of a valuable consideration and, therefore, cannot be considered anything but a gift.

It is clear that a gift does not fall within the *Eisner* v. *Macomber* definition. It is neither a gain derived from capital nor a gain derived from labor, and it is not profit gained through a sale or conversion of capital assets. It has been defined as "a voluntary transfer of property by one to another without any consideration or compensation therefor." *Blair* v. *Rosseter* (33 Fed. (2d) 286), *Noel* v. *Parrott* (15 Fed. (2d) 669, 671).

Since the enactment of the first Federal income-tax law subsequently to the adoption of the sixteenth amendment, gifts have not been included in the computation of income for income-tax purposes. But what does the proposed statute purport to do? It purports to tax this gift to a spouse as income. This is completely inconsistent with section 22 (b) (3) of the Internal Revenue Code which specifically exempts gifts from inclusion in gross income, and it is inconsistent with the definition of income as stated in the *Eisner* v. *Macomber case*.

In the case of *Towne* v. *Eisner* (242 Fed. 702, affirmed 245 U. S. 418), the question involved was whether a stock dividend made in 1914 against surplus earned prior to January 1, 1913, was taxable as "income." The Court there said at page 704:

"Now it is manifest that the stock dividend in question cannot be reached by the Income Tax Act, and could not, even though Congress expressly declared it to be taxable as income, unless it is in fact income."

The Court then went on to find that a true stock dividend is not income and therefore not taxable as such.

The question was again raised in *Eisner* v. *Macomber*, *supra*, this time following the enactment of a statute specifically declaring stock dividends to be taxable as income. The Court rejected the statute as being unconstitutional and quoted the language of the *Towne* v. *Eisner case*, *supra*. It then went on to say at page 203:

"And if, for the reasons thus expressed, such a dividend is not to be regarded as 'income' or 'dividends' within the meaning of the act of 1913, we are unable to see how it can be brought within the meaning of 'incomes' in the sixteenth amendment; it being very clear that Congress intended in that act to exert its power to the extent permitted by the amendment. * * *

The reasoning expressed in the *Towne* v. *Eisner* and the *Eisner* v. *Macomber cases* is analogous to the present situation. If a spouse receives any beneficial advantage at all from the income of his spouse, it is received as a gift and not as income. If the sixteenth amendment did not contemplate the inclusion of gifts within the term "incomes," an act of Congress may not do so.

IV. *The fundamental fallacy in the proposal to tax the separate incomes of husband and wife as joint income is the treatment of the family, and not the individual, as the recipient of income*

The Committee on Ways and Means in its report starts out with the proposition that under the present law, if the entire income is earned by the husband, the family is required to pay a greater tax than if the wife had contributed to the family income. Except by assuming the point which the committee desires to prove, there is no such thing as family income for income-tax purposes. There is the income of the husband and there is the income of the wife.

The theory underlying the proposed provision is that the legal rights of the separate spouses to their separate incomes are to be ignored and that the joint income is to be treated as available to meet the family obligations imposed

upon the husband. This assumes a status which is contrary to the laws that exist in most of the States as well as to the experience of the average couple where both have means. In practice some families, usually where the income of the separate members is small, may pool their resources, but in the case of families whose members are in the medium brackets, their treatment of all the income of each of the members as common income is unusual. If a man with income sufficient to support a wife, after deduction of taxes computed on such income, should marry a woman with a little income of her own, which is not used toward the support of the family, why should the husband's tax burden be increased and the wife be subjected to tax at high rates on her small income?

The length to which the committee's unsupported theory of so-called "family income" has driven it, is illustrated by the conclusion set forth on page 11 of its report (which may or may not be implicit in the proposed act) that "In the case of death, the surviving spouse and the decedent's personal representative are required to file a joint return for the full taxable year in which the death occurred." This would not merely result in a startling joinder of legal bedfellows, but would set up the fiction of the continued existence of a "family" after the death of one spouse, even though (as indicated in a prior sentence in the committee's report) it appears to concede that the "family" is extinguished "upon divorce or legal separation." Death, apparently, is a less vital transition for income tax purposes.

Among grotesque results of the committee's proposal is its impingement on contractual obligations undertaken by husbands in divorce decrees or alimony agreements. The rate of tax on the income paid to the divorced spouse may be considerably higher than that originally contemplated merely because the husband might have subsequently remarried a woman of substantial means. For example, assuming that an ex-husband earns $30,000 a year, $15,000 of which he pays by way of alimony, and subsequently marries a woman having an income of $20,000 a year, his tax on the $15,000 paid to the divorced wife would amount to about 40 percent rather than approximately 30 percent as before. The result would be substantially to increase the burden of the alimony contract or decree.

Again, the proposed bill would result in inequality where the wife's income is received by way of an annuity from a trust established by her husband or another, since in such case the income is taxed to the fiduciary and not to the beneficiary. Obviously, one way of avoiding the compulsory joint return would be to create a trust which provided for fixed payments to the beneficiary rather than for distribution of the annual income.

The committee report refers to the discrimination between husbands and wives living in community-property States and those living in other States. Whatever inequity there is in such situation might be largely cured by taxing to the husband the income actually earned by him, even though upon its receipt the State law treated half of it as the property of the wife. But in any event there is no equity in subjecting husbands and wives in a State like New York to an additional burden in order to solve a problem existing in the community-property States. It is no comfort to a New York husband to know that community-property-State husbands are hit even harder.

The committee report refers to gifts and family partnerships. If a husband with a natural desire to provide for his wife has made bona fide gifts to her and paid gift taxes thereon, it scarcely appears equitable to tax the income from such gifts as if they had never been made. If the husband and wife are to be treated as a unit, then there should be accompanying changes in the statutes eliminating gift taxes on transfers from one spouse to the other and providing for the nonrecognition of gain in the case of sales of property as between the two spouses. As to family partnerships, if a wife bona fide contributes to the success of a business, there would appear to be no reason why she should not receive her share of the profits as her separate or joint returns. Obviously this potential disadvantage to the Government income as though she were a third person.

The Ways and Means Committee report suggests that one reason indicating need for the change is the present provision giving an option to spouses to file separate or joint returns. Obviously this potential disadvantage to the Government may be cured by eliminating the right to file joint returns.

It should be noted that in allowing an exemption to a husband and wife slightly greater than twice the exemption of a single individual, Congress has

heretofore favored husbands and wives. The present proposal is a reversal of such policy and would severely penalize marriage, particularly in the case of individuals having income in the medium brackets. An examination of the table at page 15 of the committee's report shows that the effect of requiring a joint return is slight in the low brackets and slight in the high brackets, but is substantial in the middle brackets, in which the greatest increases in rates have been made in the last 2 or 3 years.

Under the present act the combined income taxes of a husband and wife who each had a net income of $10,000 would be $1,328.80. Under the proposed rates, in the case of a husband and wife with the same combined net income of $20,000, divided equally between them, the aggregate separate taxes on their income would amount to $2,838, and the tax under a joint return would be $4,338.40. The proposed increase over the present taxes, on the basis of requiring a joint return, is over 225 percent, and, if separate returns be continued, is still over 110 percent. If the husband had an income of $18,000 and the wife an income of $2,000, on which the separate taxes would be $3,757.60, the wife's income of $2,000 would under a joint return be required to pay an additional $680.80.

Whether it be right or wrong the result of the policy reflected in the report of the Committee on Ways and Means is tremendously to increase the tax burdens of husbands and wives in the medium brackets in favor of individuals who pay no taxes or are in the lowest brackets and in favor of individuals in the high brackets. If it is of very doubtful legality and equity to subject the middle class of taxpayers to such a burden, the fact that this unprecedented exaction would yield $300,000,000 in taxes seems insufficient justification.

It is not the function of our committee to advocate or oppose the formulation of any policy which is fairly consistent with the framework of our Constitution and with the fundamental rights of our people, but we have perhaps been warranted, in addition to expressing our opinion as to legal matters, in pointing out some of the effects of the adoption of the proposal for joint returns embodied in the House bill.

Respectfully submitted.

COMMITTEE OF TAXATION, NEW YORK COUNTY LAWYERS' ASSOCIATION,
By HUGH SATTERLEE, *Chairman.*
ROBERT G. BURKE.
MARY H. DONLON.
JACOB MERTENS, Jr.
EUGENE L. MULLANEY.
DAVID OPPENHEIM.
WESTON VERNON, Jr.

(Messrs. WILBUR H. FRIEDMAN and MORTON PEPPER, the remaining members of the committee, in part dissent from and in part concur with the foregoing statement.)

The CHAIRMAN. Mr. Boyles.

Mr. Boyles, by way of explanation why you were called out of order, Senator Connally will have to leave the committee at an early hour. He suggested that you be now called.

STATEMENT OF EDWARD S. BOYLES, HOUSTON, TEX., REPRESENTING THE FIRST NATIONAL BANK OF HOUSTON

Mr. BOYLES. Thank you, sir. I am very much pleased. I would not want to keep you waiting.

Gentlemen, I am Edward S. Boyles, of Houston, Tex. I am representing here before you the First National Bank in Houston, and a very large group of banks similarly situated in their troubles, so many, in fact, that the chairman of the legislative committee of the American Banker's Association is present with me, and I trust will feel able to approve the remarks I make when I am through.

My purpose, gentlemen, in coming here is to ask for an amendment to section 22 (b) of the existing Internal Revenue Code, as amended in 1939, to take care of the subject of bad debts. I should like, in substance, an amendment at the hands of this committee providing that recoveries on a bad debt charged off should not be taxed, except to the extent of any tax benefit to the taxpayer in the year of the deduction.

Gentlemen, that is both a necessary and a common-sense request to make.

There is today an existing hurt and a very continuing hurt not only to all taxpayers dealing in loans, but particularly to banks. The thing I am asking is utterly independent of any schedule of rates or revenue raising. I am asking at the hands of the committee that they take time out in raising revenue, to be fair, and to right a very deep hurt.

I might say here, if I am permitted, that you gentlemen have all been citizens before you were Senators. You all have been businessmen, maybe some of you bankers, before you were Senators. This public of ours does not resent an increase in revenue where it is fairly spread out over all the different groups, and particularly banks. You will not find any banks up here hollering at reasonable increases in tax rates, but, gentlemen, whenever you have any part of your tax-public feeling that this committee representing them will leave a condition existing that is hurting, it breeds resentment; it breeds bitterness, it breed frustration.

Senator BARKLEY. Let me ask you, suppose a bank, or someone else who is doing it, is allowed to charge off a bad debt, say, of $2,000, in 1940, they deduct that from their total net income, and then in 3 or 4 years, or at any time afterward, they collect that $2,000, and it turns out not to have been as bad as they thought, or they collect $1,000, what is it you want done in that case?

Mr. BOYLES. I want you to do this Senator—I wanted to come to it historically—but I will stop and answer you right now. Under G. C. M. 18525, the last thing Morris Shafroth wrote before he resigned, provides that if a taxpayer took a tax-benefit or a charge-off, then when he gets recovery, he ought to pay a tax on the recovery, but if he took no tax benefit, or got no tax benefit from it, when he recovers, it is no different from a current bank loan; any more than if you borrow $10,000 from your bank today and pay it back 18 months from now. Do I make myself clear?

Senator BARKLEY. No. Take my illustration—or maybe it is too simple.

Mr. BOYLES. No.

Senator BARKLEY. Now you have got a deduction, say, for $2,000, and the amount of tax on that $2,000 which has been assessed——

Mr. BOYLES (interposing). Senator, may I interrupt you to say this, that you have to take two conditions into consideration there, one is when the taxpayer deducts it does he need it for the tax? In other words, when he charged off the $2,000, if he had other losses sufficient to overcome it, where he received no tax benefit, that is one case. The other is where it is a normal deduction he pays the tax.

Senator BARKLEY. Nobody is compelled ever to ask for a deduction.

Mr. BOYLES. Well, I beg to differ. He is compelled under a supervision of banking officials. It has been held repeatedly.

Senator BARKLEY. He is not required ordinarily by the revenue laws to claim a reduction, he can just let it go. Of course, under good banking and the regulations of State banks and even the national banks, it is their duty to charge it off, but you are not dealing simply with banks now, you are dealing with everybody, I understand. Your amendment covers everybody that makes a loan. If I make a loan to you—this is, of course, a very violent assumption that I would make one in the first place because I could not—but even if I did and it turned out to be bad, I would deduct the $2,000 from the next year's income, and I would be benefited.

Mr. BOYLES. No; not necessarily. That is the point.

Mr. BARKLEY. I would be benefited by the reduction in the tax, assuming that I would, at least.

Mr. BOYLES. If you assume it, I will answer your question.

Senator BARKLEY. Now, 3 years from now I collect that $2,000 from you, or $1,000 of it, and it goes into my income-tax return for that year.

Mr. BOYLES. Yes.

Senator BARKLEY. Now, what would your amendment do to that $1,000?

Mr. BOYLES. Nothing, because there you took the tax benefit, you said, and I think you should pay tax on the recovery. That is not the case, Senator, that I am arguing for. I am arguing for the reverse of that.

Senator CONNALLY. Let me ask you a question, Mr. Boyles.

Mr. BOYLES. Yes, Senator Connally.

Senator CONNALLY. As I understand your situation, say, 4 or 5 years from now the examiner comes around and says you have got to charge off that note, you charge it off and take a loss; your contention is that if the taking of that loss did not benefit you any by reducing your tax, that when it is repaid you ought not to pay any tax on the repayment?

Mr. BOYLES. That is precisely correct, Senator Connally.

Senator CONNALLY. Now, if that debt had been paid back there in that taxable year instead of being charged off, your theory is that there would have been no tax because you had other losses, and so on, that taking that off did not alter your tax situation at all, and if it had been paid back there when it was due there would have been naturally no change in the situation.

Mr. BOYLES. That is correct.

Senator CONNALLY. Now, your contention is that if it is paid 3 or 4 years later, that they ought not to tax you on that as an item of income, because the taking it off back in prior years did not benefit you any.

Mr. BOYLES. And plus the fact that it never was income, Senator, it was always capital. That is correct.

Senator CONNALLY. On the other hand, you are not seeking, where the bank deducted that charge-off and thereby reduced its tax for that year, you are not contending in such case that when it is repaid, it should be tax free?

Mr. BOYLES. That is correct.

Senator CONNALLY. It ought to be taxable?

Mr. BOYLES. That is correct.

Senator BARKLEY. Suppose it is not a bank and no bank examiner comes along and says you have got to charge that off as a bad debt but you do it just because you think it is a bad debt, then what?

Mr. BOYLES. That is covered by G. C. 20854.

Senator BARKLEY. Your amendment does not cover that situation?

Mr. BOYLES. Yes; it would affect it, whether it is voluntary, under banking supervision, if no tax benefit resulted.

Senator CONNALLY. Let me ask you this: Up to 19—what year was that?

Mr. BOYLES. 1940, July 8.

Senator CONNALLY. Up to 1940 the Treasury officially took your present position?

Mr. BOYLES. Yes.

Senator CONNALLY. The Solicitor, whoever he is——

Mr. BOYLES. The General Counsel.

Senator CONNALLY. The General Counsel ruled just exactly as you are contending now?

Mr. BOYLES. Yes.

Senator CONNALLY. But in 1940 the General Counsel made a new ruling which brought that money into the Treasury.

Mr. BOYLES. That is correct. Now, gentlemen, I do not mind the questions. I like it because we get our minds together. I want to preface my remarks by saying that you are busy; you have got a job and a responsibility that I do not envy, but I do want to lay this burden on your conscience; and that is while you are raising millions, it would be awfully well to take just a little time out and correct something. I can tell you first-hand that there are hundreds, not a few, of excellent, fine banks and bankers in these United States today that are fretted, upset, worried because of a very unwise, very foolish decision by the General Counsel. The committee can right it in 15 minutes, and I think you owe that duty to a bunch of men who are trying to run good banks.

Senator BARKLEY. Could you put in the testimony the original decision and the modified decision?

Mr. BOYLES. Yes; I intend to do that, Senator, if you please.

Senator VANDENBERG. The situation would be entirely corrected if the Treasury reverted to its 1940 decision?

Mr. BOYLES. If it reverted to its decision prior to July 8, 1940; that is correct.

Gentlemen, I think most of you remember the period in 1932 and 1933. I lived it in a vivid way. I am going to use that as an illustration because it illustrates what I am going to try to get over to the committee. I lived through 1932 and 1933 as a bank lawyer. I hope I will not have to do it again.

Bankers were not worried about maybe their banks going out of existence; they were not worried particularly about losing their jobs, but they were worried about the faith of 20,000 to 30,000 little accounts in those banks that might go up in smoke. Back in 1932 and 1933, when these things were happening, I. T. 4633 was in force, which provides that if a bank examiner orders a charge-off or charge-down, as to the Government, that is conclusive. It should be, because the bank had no option about it. In those days banks that had stocks, bonds, commodity loans that looked awfully good before

the collapse of the State institutions all around until the final moratorium point; these banks, under the direction of bank examiners, charged those items down to almost nothing. They got no tax benefit from that. They were doing well to be able to navigate the ship; they had so many losses that they did not need any tax benefit from those charge-offs; and they received no tax benefits from those charge-offs.

In 1937, the last thing, as I said a moment ago, that Morris Shafroth did before he resigned as General Counsel for the Income Tax Section, was to write G. C. M. 18528, which holds crystal-clear that where there has been a charge-off or charge-down in a year with no tax benefit resulting to the taxpayer, there should be no tax on the recovery. That is sound, gentlemen. That remained the law, and in 1939—please bear this in mind—the new General Counsel, Mr. Wenchel, wrote 20854, and all that 20854 did was to extend the rule to apply to those cases where the banks or individuals of their own motion charged-off.

G. C. M. 18525 was confined to charge-offs by bank examiners. Now, Mr. Wenchel wrote the General Counsel's memorandum in 1939 which said, as I find this law to be under the rules and regulations existing today, it is my solemn judgment that the rule ought to be extended to charge-offs made voluntarily by banks. That was good law and sound sense, gentlemen. Listen to this language. I will quote it verbatim, the language that Mr. Wenchel used in that opinion:

> Until a taxpayer has had the income equivalent of a full return of the capital represented by the debt there is no valid ground for treating as income any amount received in recovery of the debt.

He could not have written it in simpler English and have said anything more accurately.

All right, that was still good law.

Remember this, too, that in 1939 this Internal Revenue Code, as amended, was passed by the Congress; and to all legislative intent, it embodied in it all the rules and regulations and General Counsel's memoranda promulgated before that date, or else it would have amended it or changed it if they did not like it. That was the state of the law until the latter part of 1939.

I am going to stop and recite, because it will help get this picture before you, the experience of the First National Bank of Houston, which will bring this thing before you very vividly.

In 1932 and 1933, due to the depression losses, we charged off a whole lot of debts. In 1936 some of those sick horses came to life, and, thank God, we received a whole lot of money from them. We reported it. We received no tax benefits in the year we charged them off, in 1932 and 1933. When we got it back in 1936 we reported it. Did we report it as income? No; as a return to us of capital previously loaned out.

Senator BARKLEY. Under the present ruling, getting back to my simple $2,000 illustration, if later, $1,000 of that is recovered, is that now regarded as income?

Senator CONNALLY. That is right.

Mr. BOYLES. Yes, sir. That is what this rather foolish G. C. M. 22163 now does. That is exactly what I want to make clear, Senator. I

am giving you the experience of the First National Bank of Houston.

You remember I said we took the charge-off in 1932 and 1933; we made the recoveries in 1936. On May 2, 1940, we received a certificate of overassessment from the Commissioner of Internal Revenue, ordering the Department to pay us some $48,000. Then what happened? Between May 2, the date we got that certificate of overassessment, and the time it takes these O. K.'d bills to get around to the other side of the office to be paid by the Treasury Department, the same Mr. Wenchel—I do not mean to say that in a harsh way, it is an impersonal matter to me, but I am a little ugly about the kind of memorandum he wrote—the same gentleman now that wrote 20854, the same gentleman who said that until a taxpayer had received back the income equivalent of the full return of his capital, there is no valid ground for treating as income any amount received in recovery of the debt, that same gentleman slammed the door in the face of some of these gentlemen and wrote G. C. M. 22163, that says, regardless of whether or not there were any tax benefits to the taxpayer, the recovery must be reported in gross income and a tax must be paid on it.

Now, gentlemen, there are two reasons he alleges in the G. C. M. and neither one is sound. He says in G. C. M. 22163 the first reason for his reversal is—well, we better go back to the old rules and regulations at the time. They were that way and we would like it better. Of course, the revenue-raising plan, unadulterated revenue raising was one reason. The other reason, he says, is that it is expedient to deal in a calendar year.

Gentlemen, that is silly. There is not a man on this bench who sometime in his life has not either borrowed from the bank and paid back in the same calendar year or borrowed in one calendar year and paid back in the succeeding calendar year. It does not make sense. It is a money-raising reversal, and it does not make common sense.

Senator BARKLEY. Do you know how much money was raised?

Mr. BOYLES. No; I do not, Mr. Senator.

Senator BARKLEY. I wondered if the amount raised justified the reversal.

Mr. BOYLES. I would say no amount raised would justify the reversal. That is the point.

Senator BARKLEY. In the view of the Treasury, I mean, if that is all it was for.

Mr. BOYLES. Yes.

Senator BARKLEY. I want to know how much it raised.

Mr. BOYLES. I do not know. I have no way of knowing.

Senator CONNALLY. As I understand it, your particular bank, as the result of its transactions in 1932 and 1936, claimed an overpayment.

Mr. BOYLES. Yes.

Senator CONNALLY. The Treasury allowed you an overpayment certificate of $48,000?

Mr. BOYLES. Yes.

Senator CONNALLY. It officially declared that you were entitled to an overpayment certificate of $48,000?

Mr. BOYLES. Yes.

Senator CONNALLY. While that was in process of certification, giving you the check, they came out with this other ruling, and you did not get your $18,000; is that correct?

Mr. BOYLES. That is exactly correct.

Senator VANDENBERG. Were there any court decisions which intervened on which Mr. Wenchel sought to rely?

Mr. BOYLES. No; Senator. On the contrary, there were two board decisions, the *Central Land Investment* v. *Commissioner* (39 B. T. A. 981), and *National Bank of Commerce* v. *Commissioner* (40 B. T. A. 72); these two board cases I cite affirmed and approved G. C. M. 18525, as sound, and the Commissioner's office acquiesced in both of these decisions.

Senator CONNALLY. Will you put in the record a brief memorandum or something, giving both opinions?

Mr. BOYLES. With the permission of the committee, I will be glad to furnish—I do not like to speak from any prepared memorandum—I will furnish to the committee a brief on any of these points that I make. Is that all right, Senator George?

Senator GEORGE. Yes.

Senator CONNALLY. Put in both opinions of the solicitors or counsel, the former one and the latter one, so we can compare them.

Mr. BOYLES. Yes.

Gentlemen, here is the situation: When this revenue-raising general counsel memorandum was issued, the same rules and regulations of the Treasury Department that had been in force, G. C. M. 18525, that had been promulgated theretofore, were still there, and had not been changed.

When counsel undertook to reverse himself, these two board decisions had been acquiesced in by his department, and they had not withdrawn their acquiescence. At that same time, Congress had, and as I say, I think it is logical, had passed this new, revised revenue amendment, had an amended code approving the soundness of G. C. M. 18525.

Senator WALSH. Is it a fact that, briefly stated, you reported as a return of impaired capital and it was ruled finally to be income?

Mr. BOYLES. Yes.

Senator WALSH. That is the whole story.

Mr. BOYLES. Plus this—each one of these questions allows me to make another, I hope, definite point, Senator—a loan has been and always will be a capital transaction. The loan, the charge-off, the recovery is all part and parcel of one capital transaction.

Senator WALSH. If a loan is made for 5 years, is it always a part of the capital transaction?

Mr. BOYLES. Yes, sir.

Senator WALSH. So that the rule of reporting all transactions each year does not apply to the loans?

Mr. BOYLES. I will answer that. That is a fundamental question, Senator. The sixteenth amendment authorized you gentlemen of the Congress to tax income. You cannot tax capital, you are forbidden to tax capital. I say again that all the writing of the General Counsel in the world cannot change capital into income. You can write reams on reams and you can never change capital to income.

Sentor BARKLEY. Your contention is, if the loan had been repaid and not charged off, the only part of it that would represent income would be the interest on it?

Mr. BOYLES. Precisely, Senator.

Senator BARKLEY. If it is paid back later in full plus interest, your contention is that only the interest that would be paid back is taxable.

Mr. BOYLES. Precisely, unless there is the one exception that the taxpayer foolishly tries to use it to get a tax benefit.

Let me ask you another question. Most of you men have had banking experience, some of you may have been in banks. If what I am talking about is not sound, we better close up banks.

If Senator Connally borrows $10,000 this year and unfortunately is not able to pay it back next year, if that make it income instead of capital——

Senator CONNALLY (interposing). I wish you would arrange such a loan.

Mr. BOYLES. I might do that, Senator. I will be glad to.

All right. If Senator Vandenberg borrowed another $10,000 from another bank and pays it in the calendar year, the fact that one pays it on January 1 in the first calendar year and the other pays it on January 1 in the following calendar year, if that can change capital to income, then I am talking wrong. That is the whole sum and substance of it. I am trying to see this thing started out as a capital transaction and it is always going to remain a capital transaction.

Senator BYRD. Do you favor an amendment to the law that a loss of a capital asset should not be deducted from the income?

Mr. BOYLES. Certainly, unless you take the tax benefit from it. Let us get back, because I want to get that point clear.

Senator BYRD. You contend that a loan is entirely a capital investment?

Mr. BOYLES. I certainly do.

Senator BYRD. Therefore, if it becomes of interest to the income tax, of course you deduct it at a loss?

Mr. BOYLES. Let us get that straight.

Senator BYRD. Would you favor treating it entirely as a capital investment?

Mr. BOYLES. Certainly it is a capital investment.

Senator BYRD. Would you favor an amendment to the law that if there was a loss to the loan that was made, it could not be deducted in any instance, from the income?

Mr. BOYLES. I do not want to say that; I do not want to be understood as saying that. They are two separate things.

If you go to a bank, Senator, and borrow $10,000, and I trust you do——

Senator BARKLEY (interposing). Why not trust him for it?

Mr. BOYLES. That might be better, Senator. At any rate, if you borrow $10,000—I want to follow that a minute and answer your question—the thing I am talking about is what happens when the bank goes to make up its income tax. If, unfortunately, you cannot pay it, and the bank has enough losses generally, so that deducting that $10,000 does not give it one cent of tax benefit, then when the recovery comes in, it ought not to be taxed any more than if I borrowed $10,000 today and paid it back tomorrow. It is a capital transaction.

Senator BARKLEY. Would not that only happen where the other losses sustained by the bank wiped out this income entirely, so there would be no object in putting in an additional loss, that would not cause you to pay any tax anyhow?

Mr. BOYLES. That is exactly it, Senator.

Senator CONNALLY. Senator Byrd was talking about whether you would favor treating it as capital and not taking a loss on it. The only advantage of taking some loss is to get your tax cut. No matter how much your capital might be impaired, your bank might be worse off than before, yet as far as the Government is concerned, unless the only purpose in the world of your bank claiming that on account of lost capital would be to save some tax, if you do not have that result, your contention is it ought to remain as capital and not be taxed as income?

Mr. BOYLES. Exactly. Let me add another thing. I do not want to take too much time, but there are some of these points that I would like to make. Gentlemen, I know that this committee is interested in sound banking. If you gentlemen let this law stay the way it is, there is an incentive to bad banking. Let me tell you why I am talking common sense and talking soundly about that.

If Senator George and you gentlemen are on an executive board of a bank, and you see the XYZ Co. beginning to get in a little trouble, the smart thing for a first-class bank to do is to say to it, "You boys start writing down XYZ. Write it down 20 percent."

That is sound banking. But if you let this present G. C. M. stand, no banker in the world is going to tell its controller to go and write down XYZ 20 or 30 percent, and then have Mr. Wenchel tell them if they get recovery, they have got to pay a tax on that 20 or 30 percent; and it has been a capital investment all the time.

Have I made myself clear?

Senator BARKLEY. Is there any definite point in such a loan as that? You say, "write down." I suppose you mean write down the value of the loan. If you did not write down the loan gradually, it would mean a shut-down of the institution.

Mr. BOYLES. I do not mean that. Let me see if I can make myself clearer.

Suppose KXVY Manufacturing Co. has a line of credit with your bank for $100,000, you have loaned them $100,000 and you have got a lot of their collateral in your portfolio, when their monthly statement comes in, you say, "It looks like these fellows are losing money there. They may not be able to pay 100 cents on the dollar on the loan." You run a bank, you want to be sound all the time. The smart thing for you to do is to say, "Now in order to have a good bank, let us write the loan down 20 percent."

Senator BARKLEY. That is an arbitrary procedure on the part of the bank. It makes up its mind that the loan worth $100,000 is now worth only $80,000.

Mr. BOYLES. What difference does it make? It is a bookkeeping entry. Let us not get fogged up in the woods because of the trees. All I am saying is that a capital transaction that starts out as capital ends up as capital. The sixteenth amendment does not let anybody tax capital, and the general counsel's memorandum cannot do that.

If this $100,000 loan is made and charged off, if the bank does not get a tax benefit, then when the recovery comes in, it ought not to carry a tax charge any more than an every day current loan made daily by banks.

The CHAIRMAN. If you do get a tax benefit, you ought to be estopped?

Mr. BOYLES. That is correctly the word that I would use. That is an equitable thing. You ought to be estopped because you take a benefit.

The CHAIRMAN. Your point is, there can be no estoppel unless you did receive a tax benefit?

Mr. BOYLES. Yes; and it is always a capital transaction, there is no question about that, gentlemen.

The CHAIRMAN. Thank you very much, Mr. Boyles. I thank you for your courtesy. You may file with the reporter or the clerk the memorandum called for by Senator Connally.

(Mr. Boyles submitted the following brief, together with the Treasury Decisions referred to, appended.)

BRIEF SUBMITTED BY EDWARD S. BOYLES AND APPROVED BY AMERICAN BANKERS ASSOCIATION WITH AMENDMENT TO SECTION 22 (B) OF THE INTERNAL REVENUE CODE (AS AMENDED BY THE REVENUE ACT OF 1939)

AN AMENDMENT TO THE INTERNAL REVENUE CODE

It is recommended that section 22 (b) of the Internal Revenue Code (as amended by the Revenue Act of 1939), should be further amended by adding thereto a new subdivision (10):

"(10) RECOVERIES ON BAD DEBTS.—Amounts received on account of a debt for which a bad debt deduction or deductions have been allowed in a prior year or prior years under section 23 (k) or under a corresponding section of any revenue act to the extent that such deduction or deductions so allowed did not result in an income tax benefit in such prior year or years. This paragraph shall be effective beginning after December 31, 1935."

Section 23 (k) of the Internal Revenue Act allows a deduction from gross income for bad debts.

On April 3, 1936, the Commissioner of Internal Revenue issued T. D. 4633. In substance this ruling ordered that where banks (or other corporations subject to supervision), charged off debts in whole or in part in obedience to specific orders of an examiner or other supervisory officer, that such debts shall be conclusively presumed, for income-tax purposes, to be worthless, or recoverable only in part, as the case may be.

On June 28, 1937, Hon. Morrison Shaforth, chief counsel of the Bureau of Internal Revenue, issued G.C.M. 18525 which held, in substance, that amounts recovered upon debts previously charged off at the direction of an examiner or supervisory officer constitute no taxable income for the year of recovery if the prior allowance of deduction resulted in no tax benefit.

On May 24, 1939, the Board of Tax Appeals in *Central Loan and Investment Company* v. *Commissioner* (39 B. T. A. 981), approved G. C. M. 18525 above and enforced it.

On June 9, 1939, the Board of Tax Appeals in the case of *National Bank of Commerce of Seattle* v. *Commissioner* (40 B. T. A. 72), again approved and enforced the ruling announced in G. C. M. 18525 above.

Both of these decisions were acquiesced in by the Commissioner.

Thereafter, in 1939, a new General Counsel for the Bureau of Internal Revenue, J. P. Wenchel, issued G. C. M. 20854. This ruling not only approved G. C. M. 18525 above, but extended the ruling to cover cases where the taxpayer makes the charge-off on his own motion (and not at the direction of a supervisory officer). In this ruling counsel uses the following language:

"It is well settled that in the ordinary case amounts received in repayment of loans do not constitute income but are reimbursements of capital."

Again:

"Until a taxpayer has had the income tax equivalent of a full return of the capital represented by his debt, there is no valid ground for treating as income any amount received in recovery of the debt."

In 1939 the Bureau of Internal Revenue issued I. T. 3172, in substance reaffirming previous regulations and General Counsel memoranda. It held that recoveries by banks on bad debts deducted in prior years do not constitute income where the amount of the recovery is less than that portion of the debt deduction which did not effect a reduction in tax liability for the prior year.

To this point the revenue act itself, the rulings of the Treasury Department thereon, and the General Counsel's memoranda are all in accord; and consistently set forth the sound rule with respect to recoveries on bad debts.

Thereafter, on July 8, 1940, the same J. P. Wenchel, as General Counsel of the Bureau of Internal Revenue (who wrote the sound G. C. M. 20851 above) issued G. C. M. 22163. In substance, this ruling modifies G. C. M. 18525 and revokes G. C. M. 20851. It holds that recoveries upon debts charged off in prior years are taxable, regardless of whether or not the taxpayer received any tax benefit.

This ruling is utterly unsound and unfair. The only excuses the counsel gives for his reversal are:

(*a*) That the Bureau itself and previous Government counsels simply did not understand the intent of the act, and,

(*b*) That all operations must be confined to a single calendar year.

Both grounds are untenable. There is no member of the committee who does not know that financial transactions with respect to debts can rarely be confined to a current year. It is a reasonable deduction that this was a pressure ruling to avoid the allowance of legitimate claims then pending, and to secure additional revenue.

All of the rulings above mentioned will be found in full in an appendix to this brief.

The purpose of this brief is to secure an amendment which will have the effect of correctly stating the law, and continuing the unbroken, consistent, fair, sound, and legal construction of the act itself to July 8, 1940, when the erroneous General Counsel's Memorandum 22163 was issued.

It is no answer that the courts will eventually correct the injustice. This committee can in 15 minutes and with two sentences correct the injustice. Awaiting court construction means that the taxpayer starts with an unfair decision against him by the Bureau. He must employ counsel and pay court costs. He must wait years for final determination. In the meantime, he is bitter and resentful toward his Government that makes such wasted effort necessary; and he suffers from a deep sense of frustration.

Every member of this committee has deep and vivid recollections of the financial tragedies of 1932–36. As bank counsel, I lived those days and have no wish to ever live them again. The banks of the country, as semipublic institutions, suffered an anguish that no other class of citizens knew. They were not concerned primarily about possible closing of their banks, nor with the loss of their particular positions; but they were seared to their souls with the thought of the possible losses to hundreds of thousands of little depositors who had trusted them to keep their money safely, and give it back to them.

During those dark days securities which had been accepted in full faith became worthless. The bank examiners required that they be written off the books of the bank. The losses were so staggering that these charge-offs resulted in absolutely no benefit to the bank. In a few years some of these "dead ducks" began to revive, and eventually very substantial recoveries were had.

Until July 8, 1940, the banks were fairly treated by the Bureau of Internal Revenue. The Bureau recognized the commonplace, common-sense fact that a loan is always a capital transaction. The loan, the charge-off, the recovery are all one capital transaction.

The sixteenth amendment to the Constitution authorizes the Congress to tax income; it does not authorize any tax whatever on capital. All of the words of any general counsel can never change capital to income, or income to capi-

tal. The matter is so simple that I hesitate even to argue it. There is no distinction whatever between a loan that has become bad, charged off, and later recovered, and an every-day current loan made by a customer, with his bank. In both cases they are capital transactions. There is no distinction between a loan made in 1 year and repaid in that year and a loan made in 1 year and repaid in a succeeding year. The matter can be reduced to an absurdity by saying that if G. C. M. 22163 be the law, then every time you borrow $10,000 from your bank in 1940 but fail to pay it back until 1941 the whole loan is income, and is taxable as such.

The history of one particular bank makes clear by inference that the General Counsel's reversal in 22163 was a pressure opinion. The particular bank in 1932–33 made large charge-offs at the direction of the examiner. In 1936 recoveries were had and the bank paid an income tax thereon of approximately $50,000. When in June 1937 the Department itself had issued T. D. 4633 and G. C. M. 18525 had been promulgated, a claim for refund was made. This claim was allowed and on May 2, 1940, a certificate of overassessment was issued and delivered to the bank, directing that the Bureau refund said sum to the bank. It takes from 60 to 90 days for these orders to go through the Department and be honored. During that interval G. C. M. 22163 was issued, and thereafter payment was refused.

Please bear in mind that the same counsel who wrote that opinion is the one who said, less than a year before in G. C. M. 20854:

"Until a taxpayer has had the income tax equivalent of a full return of the capital represented by his debt, there is no valid ground for treating as income any amount received in recovery of the debt."

I doubt if the committee has any idea of the number of banks who are being hurt by this unfair ruling. There are banks in practically every State. The officers of these banks do not resent additional taxes where, for governmental purposes, such additions are needed and are reasonable; but they do bitterly resent the unfairness of the Bureau of Internal Revenue in leading them on to a reasonable and legal course of conduct and then turning about and slamming the door in their faces. Every Senator on this committee is familiar with this psychology. There is no resentment deeper than the resentment of a citizen who chafes under an unfair act of the Government which, after all, is his government. It is a kind of resentment that becomes more bitter and bitter and ends in a lack of respect for the Government that can take his taxes promptly when due; but is unwilling to carry out its contract made with him in good faith at the time his loss was taken.

G. C. M. 18525, and the previous rulings, are conducive to good banking; G. C. M. 22163 is detrimental to good banking. If a bank has a loan of $100,000 to the Smith-Jones Co. and if it develops that the company is getting into trouble, sound banking would require that the bank anticipate any possible loss and charge off a reasonable amount of that debt. However, if the bank operates under the threat that any charge-off it makes will be subjected to a full tax as income when it be received, it is not going to take any such step.

This request has nothing to do with more taxes or less taxes, or rates, or schedules, but is simply a plea to redress an injustice.

Respectfully submitted with the request that the committee do amend the act as requested.

EDWARD S. BOYLES.

TREASURY DEPARTMENT,
OFFICE OF COMMISSIONER OF INTERNAL REVENUE,
Washington, D. C.

T. D. 4633

To Collectors of Internal Revenue and Others Concerned:

The last paragraph of article 23 (k)–1 of Regulations 86 and the last paragraph of article 101 of Regulations 77 are amended to read:

"Where banks or other corporations which are subject to supervision by Federal authorities (or by State authorities maintaining substantially equivalent standards) in obedience to the specific orders of such supervisory officers charge off debts in whole or in part, such debts shall be conclusively presumed, for income tax purposes, to be worthless or recoverable only in part, as the case may be, but in order that any amount of the charge-off may be allowed as a deduction for any taxable year it must be shown that the charge-off took place within such taxable year."

This document is issued under the authority prescribed by section 62 of the Revenue Act of 1934 and section 62 of the Revenue Act of 1932.

GUY T. HELVERING, *Commissioner.*

Approved April 3, 1936.

WAYNE C. TAYLOR,
Acting Secretary of the Treasury.

[¶6392] *Bad debts: Charged off by banks.—Application of T. D. 4633, XV–1 CB 118, re deductions for debts ascertained to be worthless in whole or in part and ordered charged off by bank examiners.*

G. C. M. 18525

REVENUE ACTS OF 1932, 1934, AND 1936

Application of Treasury Decision 4633 (C. B. XV–1, 118 (1936)), amending article 191 of Regulations 77 and article 23 (k)–1 of Regulations 86, and the last paragraph of article 23 (k)–1 of Regulation 94, relating to bad debts in the case of banks or other corporations subject to supervision of Federal or State authorities.

An opinion is requested with respect to the application of Treasury Decision 4633 (C. B. XV–1, 118 (1936)), amending the last paragraph of article 191, Regulations 77, applicable to the Revenue Act of 1932, and the last paragraph of article 23 (k)–1, Regulations 86, applicable to the Revenue Act of 1934, to read as follows:

"Where banks or other corporations which are subject to supervision by Federal authorities (or by State authorities maintaining substantially equivalent standards) in obedience to the specific orders of such supervisory officers charge off debts in whole or in part, such debts shall be conclusively presumed, for income tax purposes, to be worthless or recoverable only in part, as the case may be, but in order that any amount of the charge-off may be allowed as a deduction for any taxable year it must be shown that the charge-off took place within such taxable year."

The same provision is incorporated in article 23 (k)–1, Regulations 94, relating to the Revenue Act of 1936. The pertinent statutory provisions are section 23 (j) of the Revenue Act of 1932, section 23 (k) of the Revenue Act of 1934, and section 23 (k) of the Revenue Act of 1936, which provide for the allowance of—

"* * * *Bad debts.*—Debts ascertained to be worthless and charged off within the taxable year * * *; and when satisfied that a debt is recoverable only in part, the Commissioner may allow such debt, in an amount not in excess of the part charged off within the taxable year, as a deduction."

It is to be noted that the language of the statute relating to *partially* worthless debts does not *require* the taxpayer to claim such partial worthlessness as a deduction in any particular year. It is simply provided that the Commissioner *may* allow as a deduction such partial worthlessness in an amount not in excess of the part *charged off within the taxable year.* Treasury Decision 4633 must, of course, be applied in the light of such controlling statutory provision. Moreover, that decision must be construed in connection with the general regulations governing bad debts. (Article 191 *et seq.* of Regulations 77 and article 23 (k)–1 *et seq.* of Regulations 86 and 94.)

Treasury Decision 4633 and related regulations under the Revenue Acts of 1932, 1934, and 1936 establish the following principles applicable in bank cases for the years governed by those Acts:

(*a*) The order of the bank examiner relating to the charge-off in whole or in part of a debt owed to the bank is material only as *establishing conclusively* either total or partial worthlessness of such debt.

(*b*) Where *total worthlessness* of a debt has been so ascertained in any taxable year and the debt charged off the books of the bank in the same year, deduction on account of such ascertainment and charge-off is allowable only for the taxable year in which such ascertainment and charge-off are made. In other words, deduction for total worthlessness so ascertained may be taken only in the taxable

year in which occur both ascertainment of total worthlessness and the necessary charge-off.

(*c*) Where *partial worthlessness* of a debt has been so ascertained, such partial worthlessness may be allowed as a deduction in the year of such ascertainment, provided such partial worthlessness is charged off during such year.

(*d*) Where *partial worthlessness* of a debt has been so ascertained but no charge-off made in the year of such ascertainment, no deduction is allowable in the income tax return of the bank for the year of such ascertainment.

(*e*) Where *partial worthlessness* of a debt has been so ascertained in a certain amount in one taxable year *but no charge-off made or deduction allowed therefor in that taxable year*, and during a subsequent taxable year the amount of such partial worthlessness is ascertained in accordance with Treasury Decision 4633 in a greater amount than the amount of such partial worthlessness ascertained during the preceding taxable year, such partial worthlessness may be allowed by the Commissioner in such subsequent taxable year in the greater amount *ascertained and charged off in such later taxable year*.

(*f*) Where such *partial worthlessness* has been so ascertained in a particular taxable year but not charged off or allowed as a deduction for income tax purposes for that year, and *total worthlessness* is ascertained in accordance with Treasury Decision 4633 in a later taxable year and the necessary charge-off of such total worthlessness is made in the later taxable year, deduction for such total worthlessness is allowable for that year.

(*g*) If a debt has been so ascertained to be worthless either in whole or in part in any particular taxable year but has not been allowed as a deduction for income tax purposes in whole or in part as the case may be, amounts subsequently collected on account of such debt are not required to be included in gross income for the taxable year of such receipt (article 191, Regulations 77; article 23 (k)–1, Regulations 86 and 94).

(*h*) If a debt has been so ascertained to be partially worthless in a particular taxable year but such partial worthlessness has not been allowed as a deduction for income tax purposes in such taxable year, and the debt is subsequently sold, no adjustment of the basis of the debt should be made in determining gain or loss from such sale. This rule is equally applicable to cases where there has been ascertainment of partial worthlessness but no charge-off thereof, and to cases where there have been both ascertainment of partial worthlessness and a charge-off, provided no amount has been allowed as a deduction for income tax purposes in either situation.

(*i*) If a debt was so ascertained to be *totally worthless* in 1932 or subsequent years, which are governed by Treasury Decision 4633 or article 23 (k)–1, Regulations 94, but no amount has been allowed as a deduction for income tax purposes for the year of such ascertainment, and subsequently the debt is sold, the bank may not deduct any loss based upon the difference between the original basis of such debt and the sale price. It is the opinion of this office that to allow a loss based upon sale under such circumstances in a year subsequent to the year of ascertainment of total worthlessness would permit by indirection the evasion of the statutory provisions requiring deductions based upon claims of total worthlessness of a debt to be taken only in the year of ascertainment of such total worthlessness and charge-off. This rule is equally applicable to cases where the statute of limitations on refunds for the year of ascertainment of worthlessness has run and to cases where such statutory period has not expired. If, however, in any such case the debt is subsequently sold for an amount in excess of the original basis of such debt, it is held that the bank is not taxable on an amount greater than the excess of the proceeds of the sale over such original basis. A tax based upon the entire proceeds of the sale in such case would be of doubtful validity inasmuch as it would be based in substantial part upon an item which is not in reality gain or income. (See *Goodrich* v. *Edwards*, 255 U. S., 527; *Koshland* v. *Helvering*, 298 U. S., 441.)

(*j*) Where, in cases governed by the Revenue Acts of 1932 and 1934, a bad debt deduction based upon alleged total worthlessness was disallowed to a bank prior to the promulgation of Treasury Decision 4633 under circumstances which would have entitled the bank to such a deduction under the provisions of Treasury Decision 4633, and the statute has now barred a refund for the earlier taxable period, it is the opinion of this office that upon subsequent sale of such debt by the bank no adjustment should be made in the original basis of the debt for the purpose of determining gain or loss from the sale.

It is believed that some of the difficulty in bank cases has arisen from failure to recognize that Treasury Decision 4633 can only operate as a construction or application of a controlling statute, and that it must be read in the light of the

statutory provisions which it seeks to interpret in the application of the statute to these specific cases (bank cases). It cannot, of course, be taken as setting out substantive rules of law contrary to the plain provisions of the statute. Read in this light, Treasury Decision 4633 can only be taken as setting up a practical rule for *ascertainment* of total or partial worthlessness of debts in bank cases, and not as undertaking to give any effect to such ascertainment which will contravene provisions of the statute or related regulations.

The deductions for bad debts contemplated by the clause "allowed as a deduction for income tax purposes" (as used in (*f*), (*g*), (*h*), and (*i*) above) refer to deductions for bad debts which accomplished a reduction in tax liability and do not refer to deductions for bad debts in cases in which the taxpayer, on account of other allowable deductions, had no net income irrespective of the deduction for bad debts. [Signed by Morrison Shafroth, Chief Counsel, Bureau of Internal Revenue.]

[¶ *6162*] *Bad debt recoveries by banks: Treatment where charge-off is (1) on direction of bank examiner; (2) on taxpayer bank's own initiative; (3) by other taxpayers.—In the treatment of recoveries on bad debts where the deduction was not used to reduce taxable income in the year of ascertainment and charge-off, the rule is the same whether the debts were charged off at the specific direction of the bank examiner or by the bank on its own initiative. The rule also applies to taxpayers other than banks. It is immaterial in what year the bad debt deduction was taken (that is whether before 1931, or thereafter) but due regard must be given to the net loss provisions of the 1932 Act and prior Acts to ascertain whether taxpayer received the benefit of the bad debt deduction through a net loss carry-over.*

Bad debt recoveries by banks: Treatment where more than one debt charged off in same taxable year.—The Bureau reconsiders its ruling in I. T. 3172, 1938-1 CB 150, and holds that if in any year two or more bad debt deductions are taken and the aggregate is more than sufficient to offset taxable net income after applying all other allowable deductions, the bad debt deductions are trained as a unit and later recoveries will be treated as nontaxable until total collections on any and all such debts equal that portion of the total deduction for the particular year which did not operate to offset taxable income for such year. Excess amounts recovered will be income in the year recovery is made.

See Art. 23(k)–2 at 391 CCH ¶ 207.0502 and 207.654.

G. C. M. 20854, 1939–9–9731 (p. 2).

G. C. M. 20854

Recoveries of debts previously deducted for Federal income tax purposes do not constitute taxable income unless the deduction of the debts in prior years resulted in a reduction of tax liability.

S. R. 2940 (C. B. IV–1, 129 (1925)) modified. Recommended that I. T. 3172 (C. B. 1938–1, 150) be modified.

Advice is requested whether the ruling in *G. C. M. 18525* (C. B. 1937–1, 80), to the effect that recoveries of debts previously charged off at the direction of Federal or State supervisory officers by banks and other corporations under Federal or State supervision do not constitute taxable income unless the prior charge-off accomplished a reduction in tax liability, is equally applicable to recoveries of debts otherwise ascertained to be worthless and charged off by banks and corporations under Federal and State supervision and to recoveries of debts previously charged off by other taxpayers generally.

The inquiry is directed particularly to the following paragraphs of *G. C. M. 18525, supra:*

(*a*) The order of the bank examiner relating to the charge-off in whole or in part of a debt owed to the bank is material only as *establishing conclusively* either total or partial worthlessness of such debt.

* * * * * * *

"(*g*) If a debt has been so ascertained to be worthless either in whole or in part in any particular taxable year but has not been allowed as a deduction for income tax purposes in whole or in part as the case may be, amounts subsequently collected on account of such debt are not required to be included in gross income for the taxable year of such receipt (article 191, Regulations 77; article 23(k)–1, Regulations 86 and 94).

* * * * * * *

"The deductions for bad debts contemplated by the clause "allowed as a deduction for income tax purposes" (as used in * * * (*g*) * * * above) refer to deductions for bad debts which accomplished a reduction in tax liability and do not refer to deductions for bad debts in cases in which the taxpayer, on account of other allowable deductions, had no net income irrespective of the deduction for bad debts."

The issue presented requires a general discussion of the proper treatment, for Federal income tax purposes, of recoveries of debts charged off and claimed as deductions in prior years and involves an interpretation of the following provisions of Regulations 94:

"Any amount subsequently received on account of a bad debt or on account of a part of such debt previously charged off and allowed as a deduction for income tax purposes, must be included in gross income for the taxable year in which received. (Article 23 (k)–1.)

"Bad debts or accounts charged off subsequent to March 1, 1913, because of the fact that they were determined to be worthless, which are subsequently recovered, whether or not by suit, constitute income for the year in which recovered, regardless of the date when the amounts were charged off. (See article 23 (k)–1.) (Article 42–1.)"

It is well settled that in the ordinary case amounts received in repayment of loans do not constitute income but are reimbursements of capital. (*Charles M. Howell, Admr.*, 21 B. T. A., 757 [CCH Dec. 6559], petition to review dismissed on motion of the Commissioner, *Burnet* v. *Howell, Admr.*, 59 Fed. (2d), 1053.) This is also true with respect to amounts received in payment of debts arising from unpaid wages, salaries, rents, and similar items of taxable income which have been included in gross income. Unless a taxpayer has already recovered his capital for income tax purposes, recoveries with respect to a debt, in the opinion of this office, can not be considered as income.

In any case in which a bad debt has been allowed as a deduction and has had the effect of offsetting taxable income (meaning, for present purposes, income which would be the basis for the computation of a tax liability), the taxpayer has, to that extent, in effect had the benefit of a recovery of capital for income tax purposes. In determining the extent, if any, to which a taxpayer has thus benefited, the credits against net income provided in the Revenue Acts must be taken into account. To the extent that a deduction does not result in such a benefit to the taxpayer, the deduction can not be said to have accomplished a return of capital. Until a taxpayer has had the income tax equivalent of a full return of the capital represented by his debt, there is no valid ground for treating as income any amount received in recovery of the debt. Accordingly, the above-quoted provisions of the regulations are not to be interpreted as requiring the inclusion in income of amounts received in recovery of a debt until the taxpayer has finally recovered the capital represented by the debt either by the means referred to above or partly by such means and partly by repayment by the debtor.

G. C. M. 18525, supra, involved only bad debt deductions by banks or other corporations subject to supervision of Federal or State authorities as a result of the conclusive presumption of partial or total worthlessness established by orders of Federal or State supervisory officers. (*I. T. 3172*, C. B. 1938–1, 150.) However, the principle stated therein, that recoveries of debts previously deducted do not constitute taxable income unless the deduction of the debts in prior years resulted in a reduction of tax liability, is equally applicable in cases of recoveries of debts voluntarily deducted by banks or other corporations subject to Federal or State supervision and to recoveries of debts deducted by other taxpayers.

In any case where the total of the allowable deductions, including bad debt deductions, taken by a taxpayer in his return exceeds the gross income less the credits against net income, the question will arise as to the extent to which the deduction of the bad debt results in a benefit. In such case it will be assumed that all deductions other than bad debt deductions first apply in reduction of the taxable income. For example, if in his return for 1933 a taxpayer showed gross income (less the credits against net income) of $6,000 and claimed a bad debt deduction of $10,000, and other deductions aggregating $2,000, it would be considered that only $4,000 of the deduction for the bad debt operated to offset taxable income. There would thus remain $6,000 of the debt as to which the taxpayer did not have a return of capital.

If, in any one year, two or more bad debt deductions are taken and the aggregate amount deducted on account thereof is more than sufficient to offset the

taxable net income remaining after applying the other allowable deductions, the bad debt deductions will be treated as a unit (as if they constitute a single bad debt deduction); and if amounts are subsequently recovered on any of such debts, they will be treated as returns of capital until the aggregate collected on any and all such debts equals that portion of the unit which did not operate to offset taxable income. After the capital has been thus recovered, any amounts received in recovery of any of the debts will be treated as gross income. *I. T. 3172, supra*, sets forth a different rule, and it is recommended that that ruling be modified to accord with the foregoing conclusion.

What has been said herein with respect to the extent to which bad debt deductions operate to offset taxable income applies to debts deducted both before and after the effective date of the Revenue Act of 1934. However, as to debts deducted before the effective date of the Revenue Act of 1934, another factor must be taken into consideration. Under the prior Revenue Acts, a net loss sustained by a taxpayer in one taxable year is allowable as a deduction in computing net income of other taxable years in the manner and to the extent provided in the various Revenue Acts. See section 117 of the Revenue Acts of 1932 and 1928; section 206 of the Revenue Acts of 1926 and 1924; and section 204 of the Revenue Acts of 1921 and 1918. In determining whether deduction of a bad debt in any year prior to the effective date of the Revenue Act of 1934 resulted in offsetting taxable income (or, in other words, resulted in a return of capital), it must be determined whether such a result was accomplished by means of the application of a net loss.

In view of the fact that it will be impracticable for the Bureau to undertake the great amount of research necessary to determine whether any particular debt which has been previously deducted had the effect of offsetting taxable income, every taxpayer who receives any amount in complete or partial recovery of a debt previously deducted and who claims that such amount constitutes in whole or in part capital rather than income will be required to submit with his return a statement including complete details with respect to the prior deduction and other facts necessary for the Bureau to determine the extent, if any, to which the deduction served to offset taxable income. In the event that the taxpayer does not reasonably substantiate his claim that the amount received in recovery, or a portion thereof, constitutes a return of capital, the full amount received in recovery will be included in gross income for the year in which received.

S. R. 2940 (C. B. IV–1, 129 (1925)), in so far as it holds that amount which might be received in recovery of debts under the circumstances there presented would constitute taxable income, is hereby modified. [Signed by J. P. Wenchel, Chief Counsel, Bureau of Internal Revenue.]

[¶6165] *Banks: Recovery of bad debt after deduction.—Amount recovered by bank on bad debt deducted in a prior year pursuant to charge-off at the specific direction of bank examiner does not constitute income where the amount of the recovery is less than that portion of the debt deduction which did not effect a reduction in tax liability for the prior year.*

See Art. 23(k)–1 at 381 CCH ¶207.0705.

I. T. 3172, 1938–11–9236 (p. 2.)

I. T. 3172

Taxability of amounts recovered on debts deducted by a bank in a prior year pursuant to charge-offs at the specific direction of Federal or State bank examiners.

Advice is required relative to paragraph (*g*) of *G. C. M. 18525* (C. B. 1937–1, 80), relating to deductions for bad debts in the case of banks or other corporations subject to Federal or State supervision.

Article 23 (k)–1 of Regulations 94, relating to the Revenue Act of 1936, provides in part as follows:

"Where banks or other corporations which are subject to supervision by Federal authorities (or by State authorities maintaining substantially equivalent standards) in obedience to the specific orders of such supervisory officers charge off debts in whole or in part, such debts shall be conclusively presumed, for income tax purposes, to be worthless or recoverable only in part, as the case may be, but in order that any amount of the charge-off may be allowed

as a deduction for any taxable year it must be shown that the charge-off took place within such taxable year."

Paragraph (*g*) of *G. C. M. 18525, supra*, reads as follows:

"(*g*) If a debt has been so ascertained to be worthless either in whole or in part in any particular taxable year but has not been allowed as a deduction for income tax purposes in whole or in part as the case may be, amounts subsequently collected on account of such debt are not required to be included in gross income for the taxable year of such receipt (article 191, Regulations 77; article 23 (k)–1, Regulations 86 and 84)."

In the last paragraph of *G. C. M. 18525* it is stated:

"The deductions for bad debts contemplated by the clause "allowed as a deduction for income tax purposes" (as used in * * * (*g*) * * *, above) refer to deductions for bad debts which accomplished a reduction in tax liability and do not refer to deductions for bad debts in cases in which the taxpayer, on account of other allowable deductions, had no net income irrespective of the deduction for bad debts."

The question presented is what portion, if any, of recoveries in 1937 on the bad debts set forth in the following case, which were charged off in 1936 in accordance with orders of a bank examiner, should be reported as taxable income for 1937:

Net income for 1936 before deduction of bad debts		$10,000
Bad debt No. 1	$10,000	
Bad debt No. 2	10,000	
		20,000
Loss on 1936 return		10,000
Recovery in 1937 on bad debt No. 1		3,000
Recovery in 1937 on bad debt No. 2		1,000
Total		4,000

G. C. M. 18525, supra, relates only to bad debt deductions by banks or other corporations subject to supervision of Federal or State authorities as a result of the conclusive presumption of partial or total worthlessness established by orders of Federal or State supervisory officers. Accordingly, paragraph (*g*) of that memorandum relates only to recoveries on account of such debts and does not relate to recoveries of debts of banks or other corporations otherwise ascertained to be worthless and deducted in prior years.

As indicated in the last paragraph of *G. C. M. 18525*, deductions for bad debts contemplated by the clause "allowed as a deduction for income tax purposes" refer to deductions which accomplish a reduction in tax liability. In the instant case both charge-offs were made in 1936, and it must be assumed, for practical reasons, that the taxable net income was offset by the debt deductions in proportion to the amount deducted on account of each debt. Thus, in this case each debt, to the extent of $5,000, served to offset the taxable net income, and $5,000 of each debt resulted in no reduction of taxable net income. Since the amount recovered in 1937 on each debt was less than that portion of each debt deduction which did not effect a reduction in tax liability, it is held that no taxable income was derived from the recoveries in 1937.

G. C. M. 22163

[Bad debt recovery: Taxability.] An amount recovered upon a debt previously charged off and allowed as a deduction for Federal income tax purposes constitutes taxable income for the year of recovery regardless of whether the prior allowance of the deduction resulted in a tax benefit to the taxpayer. G. C. M. 18525 (C. B. 1937–1, 80) modified; G. C. M. 20854 (C. B. 1939–1 (Part 1), 102) revoked; and S. R. 2940 (C. B. IV–1, 129 (1925) 102) modified. Recommended that I. T. 3172 (C. B. 1938–1, 150) and I. T. 3256 (C. B. 1939–1 (Part 1), 172) be revoked; that I. T. 3278 (C. B. 1939–1 (Part 1), 76) be modified; and that the acquiescence in Central Loan & Investment Co. v. Commissioner (39 B. T. A. 981 [CCH Dec. 10,706], acquiescence, C. B. 1939 2,

6) and the acquiescence in The National Bank of Commerce of Seattle v. *Commissioner* (*40 B. T. A., 72* [*CCH Dec. 10,748*], *acquiescence, C. B. 1939–2, 26*) *be withdrawn.*

See Sec. 19.23 (k)–1 at 401 CCH ¶ 207.0705, 207.645, 207.654, 207.655.

Reconsideration has been given to *G. C. M. 18525* (C. B. 1937–1, 80) and *G. C. M. 20854* (C. B. 1939–1 (Part 1), 102), both relating to bad debts, with particular attention to the question of the proper treatment for Federal income tax purposes of recoveries of debts charged off and claimed as deductions in prior years.

The last paragraph of *G. C. M. 18525, supra*, reads as follows:

"The deductions for bad debts contemplated by the clause 'allowed as a deduction for income tax purposes' (as used in (*f*), (*g*), (*h*), and (*i*) above) refer to deductions for bad debts which accomplished a reduction in tax liability and do not refer to deductions for bad debts in cases in which the taxpayer, on account of other allowable deductions, had no net income irrespective of the deductions for bad debts."

G. C. M. 18525, supra, was published to illustrate the application of the provisions of article 191 of Regulations 77 and article 23 (k)–1 of Regulations 86, both as amended by *Treasury Decision 4633* (C. B. XV–1, 118 (1936)), and the provisions of the last paragraph of article 23 (k)–1 of Regulations 94, which reads as follows:

"Where banks or other corporations which are subject to supervision by Federal authorities (or by State authorities maintaining substantially equivalent standards) in obedience to the specific orders of such supervisory officers charge off debts in whole or in part, such debts shall be conclusively presumed, for income tax purposes, to be worthless or recoverable only in part, as the case may be, but in order that any amount of the charge-off may be allowed as a deduction for any taxable year it must be shown that the charge-off took place within such taxable year."

The last paragraph of *G. C. M. 18525, supra*, in effect provides that there shall be no adjustment of the basis of a debt as the result of the prior deduction of such debt in whole or in part unless such prior deduction accomplished a reduction in tax liability. The primary purpose of the incorporation of that paragraph in *G. C. M. 18525* was to set forth the rule that amounts recovered upon debts deducted in prior years do not constitute taxable income unless such deduction resulted in a reduction in tax liability. Thereafter, in *I. T. 3172* (C. B. 1938–1, 150) there was set forth the method for determining the extent of the benefit derived by the deduction of bad debts. That ruling was later modified by *I. T. 3256* (C. B. 1939–1 (Part 1), 172), in accordance with the recommendation contained in *G. C. M. 20854, supra*, which is discussed in the next paragraph of this memorandum.

G. C. M. 18525, supra, involved only bad debt deductions by banks or other corporations subject to supervision of Federal or State authorities as a result of the conclusive presumption of partial or total worthlessness established by orders of Federal or State supervisory officers. However, in *G. C. M. 20854, supra*, it was held that the principle stated in *G. C. M. 18525*, that recoveries of debts previously deducted do not constitute taxable income unless the deduction of the debts in prior years resulted in a reduction in tax liability, is equally applicable in cases of recoveries of debts voluntarily deducted by banks or other corporations subject to Federal or State supervision and to recoveries of debts deducted by other taxpayers. It was held that in any case in which a bad debt has been allowed as a deduction and has had the effect of offsetting taxable income, the taxpayer has, to that extent, in effect had the benefit of a recovery of capital for income tax purposes, but that amounts received in recovery of the debt should not be treated as taxable income until the taxpayer has fully recovered the capital represented by the debt either by such means or partly by such means and partly by repayment by the debtor.

In *I. T. 3278* (C. B. 1939–1 (Part 1), 76) the principle of *G. C. M. 20854, supra*, was extended to amounts of State taxes refunded or credited, and it was held that the amount refunded or credited should be treated as taxable income only if and to the extent that it is in excess of the portion of the prior deduction which did not have the effect of offsetting taxable income. That ruling (*I. T. 3278*) modified *Mimeograph 3958* (C. B. XI–2, 33 (1932)) and *Mimeograph 4564* (C. B. 1937–1, 93), relating to the taxable status of refunds of customs duties and taxes.

In *Central Loan & Investment Co. v. Commissioner* (39 B. T. A., 981 [CCH Dec. 10,706], acquiescence, C. B. 1939–2, 6), the Board of Tax Appeals applied the rule

stated in *I. T. 3278, supra*, in reference to taxes, citing in its opinion *G. C. M. 18525, supra*, and *G. C. M. 20854, supra*. In *The National Bank of Commerce of Seattle v. Commissioner* (40 B. T. A., 72 [CCH Dec. 10,748], acquiescence, C. B. 1939–2, 26, on recovery of bad debt issue), the Board applied the said rule to bad debts, again citing the above-mentioned *General Counsel's memoranda*. In neither of these Board of Tax Appeals decisions did the Board refer to its prior decisions in *Lake View Trust & Savings Bank v. Commissioner* (27 B. T. A., 290) [CCH Dec. 7854], in which it was held that amounts received in recovery of debts allowed as deductions in prior years constitute taxable income irrespective of whether such prior deductions had the effect of reducing the taxpayer's taxable income.

Section 19.42–1 of Regulations 103, relating to the Internal Revenue Code, provides in part as follows:

"* * * Bad debts or accounts charged off subsequent to March 1, 1913, because of the fact that they were determined to be worthless, which are subsequently recovered, whether or not by suit, constitute income for the year in which recovered, regardless of the date when the amounts were charged off. * * *"

This regulation has been in effect in all of the income tax regulations of the Treasury Department to the present time.

Section 19.23(k)–1 of Regulations 103 provides in part as follows:

"* * * Any amount subsequently received on account of a bad debt or on account of a part of such debt previously charged off and allowed as a deduction for income tax purposes, must be included in gross income for the taxable year in which received. * * *"

This regulation has been in effect in all of the income tax regulations of the Treasury Department from article 151 of Regulations 62 to the present time.

Prior to the issuance of *G. C. M. 18525, supra*, the Bureau had consistently held that any amount subsequently recovered on account of a debt previously charged off and allowed as a deduction for income tax purposes must be included in gross income for the taxable year in which received, regardless of whether the prior allowance of the deduction resulted in a benefit to the taxpayer. As pointed out heretofore, in the case of *Lake View Trust & Savings Bank, supra*, decided prior to *G. C. M. 18525*, the Board of Tax Appeals sustained the Bureau practice.

Upon reconsideration, it is now the opinion of this office that the rule sustained in the case of *Lake View Trust & Savings Bank, supra*, is the correct rule to be followed. This conclusion is in accord with the decision of the Supreme Court of the United States in *Burnet v. Sanford & Brooks Co.* (282 U. S., 359, *C. D.* 277, C. B. X–1, 363 (1931) [2 USTC ¶ 636]). The taxpayer in *Burnet v. Sanford & Brooks Co.* had entered into a dredging contract with the United States and, after having performed for three years at a large loss, abandoned operations and sued the Government for breach of warranty as to the character of the material to be dredged. Judgment was recovered for $192,577.59, of which $176,271.88 was the amount by which its expenses of operation under the contract exceeded receipts from it, and the balance, $16,305.71, represented accrued interest. During the years of operation the taxpayer had returned as gross income the receipts under the contract and had deducted its expenses paid in performing the contract. For all but one of such years the returns showed net losses. The taxpayer failed to return the amount of the judgment as income in the year of receipt, and the Commissioner, therefore, assessed a deficiency. In upholding the action of the Commissioner, the Supreme Court said in part:

"All the Revenue Acts which have been enacted since the adoption of the sixteenth amendment have uniformly assessed the tax on the basis of annual returns showing the net result of all the taxpayer's transactions during a fixed accounting period, either the calendar year, or, at the option of the taxpayer, the particular fiscal year which he may adopt. * * *

"That the recovery made by respondent in 1920 was gross income for that year within the meaning of these sections can not, we think, be doubted. The money received was derived from a contract entered into in the course of respondent's business operations for profit. While it equaled, and in a loose sense was a return of expenditures made in performing the contract, *still*, as the Board of Tax Appeals found, *the expenditures were made in defraying the expenses incurred in the prosecution of the work under the contract, for the purpose of earning profits. They were not capital investments*, the cost of which, if converted, must first be restored from the proceeds before there is a capital gain taxable as income. * * *" [Italics supplied.]

Under the principle of the Supreme Court's decision in the *Sanford & Brooks Co. case, supra*, items of expense incurred in carrying on a trade or business do not represent capital investment, the cost of which, if converted, must first be restored before there is a capital gain taxable as income. Bad debts charged off in any business are deductible under a specific provision of the Revenue Acts rather than as ordinary and necessary business expenses. They are, nevertheless, under well-established accounting practices, recognized as operating expenses of the business deductible as such in arriving at the net operating gain or loss for the periods involved. See Finney, Principles of Accounting, 1934 Edition, Volume I, page 37, and Kester, Principles of Accounting, Fourth Edition, pages 46, 116, and 554. Consequently, the amount represented by debts which become worthless and are charged off in the carrying on of a trade or business is not to be considered as an investment of capital which must first be returned in full before taxable income is derived. Under this principle, amounts recovered in any taxable year upon debts previously charged off and allowed as a deduction should be treated as taxable income regardless of whether the prior allowance of the deduction resulted in a tax benefit to the taxpayer.

It is the opinion of this office, furthermore, that in the case of a bad debt owing to a taxpayer which has not arisen in connection with the carrying on of a trade or business, the recovery of such a debt where it has been charged off and deducted in a prior year constitute taxable income irrespective of whether the prior allowance of the deduction resulted in a tax benefit. In *United States* v. *Ludey* (274 U. S., 295, *T. D. 3076*, C. B. VI-2, 157 (1927) [1 USTC ¶ 234]) it was held that in ascertaining the basis for computing gain or loss in the case of the sale of depreciable or depletable assets, the original basis thereof must be reduced by the amount of depreciation and depletion allowable as deductions in the years during which the property was held regardless of whether deductions had been claimed. It is to be observed that the Revenue Act involved in that case did not contain a specific provision requiring such a reduction of basis. It is believed that this case stands for the proposition that, under the broad purposes of the Revenue Acts, a taxpayer is to be charged with having recovered his capital to the extent that the statute permits deductions from gross income on account thereof, regardless of whether the taxpayer took advantage of the deduction privilege provided in the Revenue Acts. See also *Hardwick Realty Co., Inc.*, v. *Commissioner* (29 F. (2d), 498 [1929 CCH ¶ 9026], certiorari dismissed on motion, 279 U. S., 876), in which it was held that depreciation must be deducted in ascertaining the adjusted basis of depreciable property even though deductions for depreciation in the years sustained conferred no tax benefit.

The case of *United States* v. *Ludey, supra*, would seem to indicate that amounts recovered upon a debt, whether or not incurred in business, constitute taxable income if in any prior year such debt constituted an allowable deduction under the applicable Revenue Act, even though such deduction was not claimed and allowed. See *S. R. 2950* (C. B. IV-1, 129 (1925)), modified in *G. C. M. 2085*, *supra*, in which it was held that under article 52 of Regulations 45, article 51 of Regulations 62, and article 50 of Regulations 65, the amount of a debt written off and *allowable* as a deduction should be treated as income for the year in which actually recovered. However, in view of the fact that all of the regulations beginning with article 151 of Regulations 62, promulgated under the Revenue Act of 1921, have contained the provision that any amount subsequently received on account of a bad debt or on account of a part of such debt "previously charged off, *and allowed as a deduction for income tax purposes*" [italics supplied] must be included in gross income for the taxable year in which received, taxpayers will not be required to return as income any amounts received in recovery of debts except to the extent that such debts have been previously claimed and allowed as deductions. As indicated above, however, if a debt was allowed as a deduction in whole or in part in a prior year, amounts recovered upon such debt constitute taxable income in the year of the recovery to the extent previously allowed as a deduction, *irrespective of whether the allowance of the deduction resulted in a tax benefit to the taxpayer*.

The foregoing is consistent with the manner in which the Bureau computes the gain or deductible expense to a corporation upon the retirement of its bonds. Section 1922(a)-18 of Regulations 103 provides that if bonds are issued by a corporation at a discount, the net amount of such discount is deductible

and should be prorated or amortized over the life of the bonds. It further provides that if the corporation purchases any of such bonds at a price in excess of the issuing price plus any amount of discount already deducted, the excess of the purchase price over the issuing price plus any amount of discount already deducted is a deductible expense for the taxable year. It is provided, however, that if the corporation purchases any of such bonds at a price less than the issuing price plus any amount of discount already deducted, the excess of the issuing price, plus any amount of discount already deducted, over the purchase price is gain or income for the taxable year. In computing the income or deductible expense under the regulations, the Bureau has adopted the view that it is immaterial whether the deductions on account of bond discount resulted in a tax benefit to the taxpayer.

In view of the foregoing, *G. C. M. 18525, supra*, is modified by eliminating the last paragraph thereof; *G. C. M. 20854, supra*, is revoked; and *S. R. 2940, supra*, is modified to accord with the views expressed herein. It is recommended that *I. T. 3172, supra*, and *I. T. 3256, supra*, be revoked; that *I. T. 3278, supra*, be modified; and that the acquiescence in *Central Loan & Investment Co. v. Commissioner, supra*, and the acquiescence in *The National Bank of Commerce of Seattle v. Commissioner, supra*, be withdrawn. [Signed by J. P. Wenchel, Chief Counsel, Bureau of Internal Revenue.]

Mr. BOYLES. Senator George, before I leave, I want to present Mr. Mylander.

The CHAIRMAN. Mr. Mylander, will you come over, please?

Mr. BOYLES. It will not take but a moment of time. Gentlemen of the committee, I would like to present Mr. Charles Mylander, who is chairman of the taxation committee of the American Bankers Association.

The CHAIRMAN. Yes, sir.

STATEMENT OF CHARLES MYLANDER, COLUMBUS, OHIO, CHAIRMAN, TAXATION COMMITTEE, AMERICAN BANKERS ASSOCIATION

The CHAIRMAN. Did you wish to add your endorsement to what Mr. Boyles has said?

Mr. MYLANDER. I simply want to say, Senator, that we heartily endorse everything that Mr. Boyles has said. The condition of which he speaks has been a very fine explanation of it.

The CHAIRMAN. It is a matter that I presume has been discussed by the bankers?

Mr. MYLANDER. We have discussed it with the Treasury at great length, starting way back in 1933 and 1934 and on down through the present time.

The CHAIRMAN. You have been unable to get what you conceive to be the correction of the erroneous ruling? The Treasury still adheres to that?

Mr. MYLANDER. No; because the ruling just came out in 1940, G. C. M. 22163.

The CHAIRMAN. There has been no modification of it?

Mr. MYLANDER. A slight modification to take care of things which banks had done while G. C. M. 18525 was in force.

The CHAIRMAN. I see.

Mr. MYLANDER. There was about a 2-year period in there.

The CHAIRMAN. I see. Anything else?

Mr. MYLANDER. That is all. Thank you.

The CHAIRMAN. Mr. Iglauer?

STATEMENT OF JAY IGLAUER, CLEVELAND, OHIO, CHAIRMAN, TAXATION COMMITTEE, NATIONAL RETAIL DRY GOODS ASSOCIATION

The CHAIRMAN. Mr. Iglauer, will you give to the reporter there your full name, for whom you are appearing, and so forth?

Mr. IGLAUER. Mr. Chairman and members of the Senate Finance Committee, I was very much interested in the statement made by Mr. Satterlee a few minutes ago in which he discussed a general sales tax, or a general excise tax. It was not quite clear which he meant, but you know, in our brief before the House Ways and Means Committee, we recommended a general excise tax on a large list of commodities, on the whole list except food and medicines, and if there are any members here who are interested in that question later, I will be glad to answer questions.

The CHAIRMAN. I see you have a brief.

Mr. IGLAUER. Yes.

The CHAIRMAN. Would you like to put that in the record and speak extemporaneously here?

Mr. IGLAUER. No; I would rather follow the brief, if you do not object. I shall be very glad to, however, answer any questions, I shall be willing to be interrupted at any point in the presentation.

The National Retail Dry Goods Association, for which I appear, as chairman of its taxation committee, is more than 30 years old and has in its direct membership approximately 5,900 retail dry goods and department stores located in every State in the Union.

These are days fraught with vexing problems and momentous decisions. The answers you must give to the fateful questions of the hour may well be the deciding factors in the preservation of the American way of life. At the hearings of your committee in the past we have been impressed with your earnest concentration and conscientious approach to the difficult task of raising unprecedented amounts of revenue. In our discussion of the tax bill before you we shall try to measure up to the standard set by you.

The President, the Treasury, and the Congress have declared the principle that these new taxes should be predicated upon ability to pay and upon equity to those with lower incomes. With this we are in agreement.

The Treasury has indicated it believes with the economists that in the interest of adequate defense, it is necessary to put a curb upon further expansion in consumer purchasing power by the imposition of heavy taxes. For several years the administration has engaged in a number of activities designed to stimulate purchasing power and to reduce unemployment. To continue these activities, even on the present scale, would appear to be wholly inconsistent with our present fiscal policy and with the urgent demand for funds for defense.

While it may seem not germane to this discussion, we earnestly recommend that you, as individual members of the Senate, give consideration to the suggestion made by us in our brief to the Ways and Means Committee, and made by both parties in both Houses—that a permanent committee be created composed of three members each

of the Ways and Means Committee, of the House Appropriations Committee of the Senate Finance Committee and of the Senate Appropriations Committee. This committee would have the duty of making studies and recommendations for economies and for eliminations of those activities and attendant expenses which were designed to stimulate employment and purchasing power.

The National Retail Dry Goods Association feels that these recommendations for greater efficiency and economy in nondefense Government activities are in no way inconsistent with its previously expressed support of social security, of aid to the aged or the unemployable.

Individual income taxes.—Our committee has no comment to make with respect to this part of the proposed bill as passed by the House. We are opposed to any increase in rate.

Corporation taxes.—We fully appreciate the inherently complicated character of the entire tax structure. We urge you to consider—some time, some year—if not now—simplification of Federal corporate taxes and elimination of the guesswork that is involved in the declared value tax.

We have been doing that for some time, for some years. Without considering social security and other Federal taxes, a corporation pays under this bill a normal tax, surtax, an excess profits tax, a defense tax, a capital stock and declared value tax, and a penalty tax for those who use the invested capital basis, all out of the same income. To you further comment on this suggestion would be superfluous.

Excess-profits tax.—Our taxation committee and the membership of the National Retail Dry Goods Association commend the retention in the bill of the alternative methods of computing the excess-profits credit, because it meets more equitably the needs of corporations with widely varying capital structures and earnings.

Capital stock tax and declared value excess-profits tax.—The present law provides for a declaration of value every 3 years. It is wellnigh impossible to make an adequate estimate of the earnings of a corporation for a period of 3 years in advance at any time, but particularly so at the present time under existing economic conditions. For most companies it is a guessing contest between the corporation and the Government. We therefore urge you to consider inserting in the proposed bill before you a provision for an annual declaration of value.

Senator VANDENBERG. It makes three guessing contests instead of one.

Mr. IGLAUER. That is right, but you are much nearer the facts each time.

Estate and gift taxes.—Our taxation committee feels justified in making a suggestion under this section because of its application to retail establishments where often practically the entire fortune of the taxpayer is invested in a single enterprise, the dispersion of which might be disastrous to the business as well as to the revenues to the Government.

We recommend that you include in title IV—estate and gift taxes—a provision to amend section 812 of the Internal Revenue Code to

provide that insurance taken out by a taxpayer, payable irrevocably to the Treasurer of the United States, to the extent that such insurance is used for the payment of taxes levied by the United States by reason of the death of the insured, be exempt from inclusion in the assured's gross estate, for purposes of estate and inheritance taxes, now or hereafter levied. The excess, if any, of such insurance proceeds over the amount so used for the payment of such taxes shall be repaid without interest to the estate of the decedent, and shall be taxable thereunder as to such excess. This permits provision by a taxpayer to meet the estate and inheritance-tax liability and avoids the pyramiding of estate and inheritance taxes present under the existing law.

Senator DANAHER. Suppose that the individual is not insurable?

Mr. IGLAUER. Then you do not have any problem, because you do not have any insurance. This merely avoids the payment of a tax on insurance purchased just for that purpose.

Excise Taxes.—This is the important part of our presentation. The retailers' excise taxes on jewelry, furs, and toilet preparations provided for in part V, chapter 19, should be changed to excise taxes imposed at the point of manufacture.

The bill, for the most part, provides that excise taxes shall be imposed at the point of manufacture. There seems to be no adequate reason for singling out jewelry, furs, and toilet preparations to be treated differently, by imposing a retail sales tax.

They have very little to do with the defense situation.

Senator WALSH. Is the tax made upon the retailer because a good many of those commodities are imported?

Mr. IGLAUER. No. I think it is probably because of some statements made by the Treasury, concerning the difficulties of interpretation and definition, which will be increased one-hundred-fold or one-thousand-fold if they are made upon the retailer.

Senator WALSH. It is a fact that jewelry and furs that are expensive are imported?

Mr. IGLAUER. They were imported, and to a limited extent, are imported now, but I question whether there will be a large amount imported in the immediate future. No; I think it is wholly a domestic situation.

Uniformity and ease of collection dictate that the tax be imposed at the point of manufacture.

Prior revenue acts imposed taxes on such articles at the point of manufacture and not on the sale at retail. Furthermore, the recent Revenue Act of 1940 imposed a manufacturer's excise tax on toilet preparations. Precedent, therefore, would support a continuance of the established method of collecting excise taxes, and would avoid the creation of new administrative problems.

In our opinion, the proposed taxes on retail sales will be almost impossible of administration. Everyone knows of the sales counters at the entrances of office buildings, the numerous beauty parlors and barber shops, retail stores in homes, crossroad general stores, and the numberless novelty stands in parks and resorts and the so-called 5- and 10-cent stores; all of which sell toilet preparations and

jewelry. In addition, these items are sold in department stores, specialty stores, drug stores, and countless other outlets. According to the last census[1] there were 1,770,355 individual stores reporting to the Census of Business—approximately 1 retail store for every 74 men, women, and children in the United States. It would be a tremendous task to police all these places, collect the taxes, and make any kind of a thorough audit of the returns filed. The administrative job would be made infinitely easier if the tax were made an excise tax at the point of the manufacture.

SEC. 2400. *Tax on jewelry, etc.*—Section 2400 imposes a 10-percent tax on the retail sale of all articles commonly or commercially known as jewelry, whether real or imitation, and articles made of, or ornamented, mounted, or fitted with precious metals or imitations thereof; and so forth. Unless some exemptions are made on articles of small value, evasion will be widespread and the cost of collection will be disproportionate to the revenue derived therefrom.

Practically every roadside stand, drug store, and every other form of retail outlet sells some form of inexpensive novelty or souvenir or article that might be described as jewelry or as an article "made of or ornamented, mounted, or fitted with precious metals or imitations thereof."

Many women's pocketbooks have a clasp or button which would bring them within the definition. Men's suspenders with a clasp, men's belts with buckles, evening slippers with buckles, compacts, lipstick holders, umbrellas, and many articles of widespread sale would be subject to a tax of 10 percent on the full price, because of ornamentations of insignificant value. The problem of distinguishing taxable items would be all but impossible in most stores and the auditing and administrative problems of the Bureau of Internal Revenue would be well-nigh insurmountable.

For these reasons we urge that the jewelry tax be imposed at the point of manufacture.

If the tax on jewelry is to be a retail tax, we recommend that articles sold at prices of $3 or less be exempted. This could be done by inserting the words "at a price in excess of $3" after the word "retail" in line 6, page 76, of H. R. 5417.

The proposed law is worded almost identical to a similar section in the 1932 law which imposed a 10-percent tax on the sale of jewelry by manufacturers. Although it rested on the smaller revenue-producing base of manufacturers' prices, nevertheless it provided that the 10-percent tax did not apply to any article sold for less than $3 at wholesale, except parts for watches or clocks. In the 1934 law, section 609, this exemption was raised to $25.

A $3 exemption on the sales price, we believe, would lessen some of the troublesome administrative problems with a minimum loss of revenue. This is particularly true of the innumerable items coming under the definition "mounted, ornamented, or fitted with, precious

---

[1] Data from Bureau of the Census:

Population, Apr. 1, 1940, census	131,669,275
Stores: Independents, chains, and others	1,770,355
Total employees in above stores	*4,600,217
Employees, including proprietors	*6,213,890

*Do not include unpaid family members.

metals or imitations thereof; etc.," which caused great difficulty in the Bureau and among retailers under the 1918 law.

Senator VANDENBERG. As between the two suggestions, you prefer to revert to the manufacturers' tax?

Mr. IGLAUER. By all means. We prefer a general manufacturers' tax against a specific tax which is discriminatory against the industries so taxed.

Senator JOHNSON. What would you do with the retail stock on hand?

Mr. IGLAUER. I would not do anything with it.

Senator JOHNSON. You just would not tax it?

Mr. IGLAUER. That is right. We would get rid of it as fast as we could.

Senator JOHNSON. It might take several years.

Mr. IGLAUER. It does not take long. As soon as they know there is a tax going to be put on certain merchandise, they start buying it up. We already feel the impact of people trying to buy a lot of merchandise before the tax goes on.

SEC. 2401. *Tax on furs.*—Section 2401 imposes a retail tax on furs which we believe should be imposed at the point of manufacture. It is copied literally from the 1918 law and regulations 47, article 31, which was the kind of tax we recommend, namely, a manufacturers' excise tax. The manufacturer has available to him all the information necessary to determine taxability.

In the case of articles only partly made of fur, such as a fur-trimmed coat, he knows from his records the value of each component part. The retailer has no such knowledge, and in order to compute the tax he must rely on hearsay or opinion, or must obtain the information from the manufacturer or wholesaler who is under no legal obligation to disclose such information. The field examiner of the Bureau will be in no better position to determine taxability from information obtainable through the retailer whose records he may be examining. He has to go back again to the manufacturer. The variety of articles made partly of fur is far greater today than it was 22 years ago. For example: Fur-trimmed coats, hats, gloves, slippers, scarves, rugs, throws, and even toy animals; the retailer cannot be expected to know the relative value of the fur in all these articles. He does not now have the information on large stocks of fur-trimmed garments and other articles. How will he get it?

Many manufacturers of fur also sell at retail; under the law it will be difficult to determine the extent of their taxable retail sales. Retail fur outlets are too numerous to police properly and the cost of audit and collection will be disproportionate to the yield. A manufacturers' tax is collected at the source and is therefore less difficult to collect and more easily susceptible of proof by the Bureau.

Senator VANDENBERG. It seems to me that your position is absolutely incontrovertible with the single exception that your floor-stock problem still remains, and I do not think your answer to Senator Johnson covered it. I think you have got to close the gap on floor stocks.

Mr. IGLAUER. You have had floor-stock taxes in the case of manufacturers' taxes for several years.

Senator VANDENBERG. There could not be a floor-stock tax to meet that situation?

Mr. IGLAUER. If you did not have the retail tax; yes. If you have a retail tax, you could not have a floor-stock tax.

The Congress has hitherto recognized these facts as evidenced by the act of 1918 and the act of 1932 which was later amended in 1934 and 1936; all of which were manufacturers' excise taxes.

Because the proposed section taxes articles of which fur is the component material of chief value, and because it is impracticable for the retailer to determine such value, the tax liability will be difficult of determination, and tax evasion and loss of revenue will result.

In fact, it is our well-considered belief that the retailer cannot comply with the present provisions of this section of the proposed bill.

Nevertheless, if the tax is to remain as a retail tax, the law must distinctly provide that it shall be the duty of the manufacturer or wholesaler to specify on all invoices to the retailer for merchandise in which fur is only one of the materials, the value of the fur content in relation to other component parts.

We are not interested in whether he gives you each fraction of fur value, but he must indicate when fur is the component material of chief value.

Senator DANAHER. A question.

Mr. IGLAUER. Certainly.

Senator DANAHER. Is this the real purpose; is it not actually to levy a tax merely to curtail an individual buying, that that form of tax incidence will have a greater tendency to reduce public buying?

Mr. IGLAUER. I do not think it would make any difference one way or the other. In fact, take the hosiery, for instance. You are probably familiar with that through reading about it in the newspapers. As soon as there was a scarcity apparent, the women flocked to the stores to get all the hosiery they could. I think what would disturb the economy the least is what we recommended to the House Ways and Means Committee, a general excise tax on a large list of commodities at a low rate, say, 3 percent, even 4 percent. I have made some figures, which I shall be glad to give you, based on the census. The Census of Manufactures for 1939 shows that the fair value of products was $56,828,000,000. Now, from that we have to take food and drugs, the two things that we said should not be taxed, and that would take off about $11,200,000,000 leaving $45,628,000,000. Then there is the intercompany transfers. That item has to be taken out because that represents items that would be double-taxed, unless there was a drawback arrangement such as was provided in the 1932 proposal for a manufacturers' tax.

We take out $12,319,000,000 for that and we are left with $33,309,000,000; at 3 percent that would give you practically a billion dollars. If you add the liquor taxes of $127,000,000, that gives you $1,127,000,000 as compared with $514,900,000, which is the estimate of the Treasury on the yield from the same taxes, specifically charged at 10 percent on a certain group of commodities.

Senator TAFT. What would be the practicability of omitting clothing also under a certain value? Is that a difficult thing to do? I suppose food and clothing are the necessities rather than food and drugs.

Mr. IGLAUER. To eliminate clothing under a certain price would, I think, assist the situation. It would eliminate some of the tax. I

cannot tell you how much it would eliminate. But this would more than make up, you see, in amount for what was lost in taking out the joint individual returns, which was, I think, $300,000,000.

Senator VANDENBERG. Now, the figures you have used eliminate all duplications in sales and all pyramiding?

Mr. IGLAUER. I have used the Census of Manufactures. I have gotten some figures which relate to the things on which there would be duplication. I cannot put this in the record as an official record because it was very informally done, but I have taken out the intercompany transfers which amount to about 27 percent of the total of $55,000,000,000, so I have taken out the full 27 percent giving you a net of $33,309,000,000. Now, you may say why is the total production at wholesale as much as the amount which is reported by the Census of Manufactures as retail trade, which is $33,000,000,000. It is because, included in the wholesale figures are the supplies to retailers and other service industries which would not be shown at retail, you see. That is what raises that amount at wholesale. It surprised me because it means a large amount of taxes have been lost sight of, I suppose because of the ratio between wholesale and retail.

Another advantage it has is that if in another year or two the situation financially should be worse because of the war and what not, an increase of 1 or 2 percent in the rate is much easier to accomplish than to make specific changes and have a troup of men coming here, each one telling you why the tax on his industry is bad. The task on the part of your Bureau of Internal Revenue and the task on the part of the individuals in the industry would be, I think, greatly simplified.

Senator VANDENBERG. Of course, that is completely sound, also. Establish a principle and fit it to your necessities.

Mr. IGLAUER. That is right.

Senator TAFT. Mr. Iglauer, would you tell us what you think as to the passing-on incidence of these excise taxes? To what extent the retailer is likely to pass them on or be able to pass them on to the consumer?

Mr. IGLAUER. There is no shifting of burden when the retailer says, "Make this a manufacturers' excise tax instead of a retail tax," because, if it is a manufacturers' excise tax, it appears on the invoice which he receives and he has to recover on the price that he pays enough to make his margin, as he usually does.

Senator TAFT. He is likely to pass on the manufacturers' excise tax by a readjustment of prices generally?

Mr. IGLAUER. Yes; in part, at least. So will he pass on the retailer's tax. The tax on the retailer in all these cases will be passed on to the consumer. The three taxes you have selected here, i. e., the House has selected, provision is now being made in a number of States, and it is my intention to make a suggestion along that line, that the tax shall be shown as a separate item on the bill, because that is the only way you can get a fair administration of the tax and a fair audit of the tax, which I shall deal with separately in my brief.

Senator JOHNSON. Senator Brown on this committee suggested that low-priced clothing, such as the $5 shoe, should not be taxed, whereas the $12 shoe should carry a tax. Following out the question asked by Senator Taft, Is it possible to have a manufacturers' tax that

would make a difference between low-cost clothing and high-cost clothing? Could you do that?

Mr. IGLAUER. Yes. As a matter of fact, in 1936 the fur tax was a manufacturers' tax, but it set the price at $75, below which there was no tax; and that very well disposed of the component material of chief value, because a fur-trimmed cloth coat that was in excess of $75 in value left no question but that the fur was the component material of chief value. So, applying that generally, if you wanted to make the burden less heavy, you should probably reduce it to something like $300,000,000 or $400,000,000 or $500,000,000 instead of the amount indicated here, nearly a billion dollars, by putting in certain minima in the manufacturers' excise tax which would exempt certain items of clothing.

Senator TAFT. Mr. Iglauer, I notice in dealing with jewelry, you said nothing anywhere about clocks and watches. Have you any remark to make about clocks and watches?

Mr. IGLAUER. No; I make no distinction. Clocks and watches are included in the jewelry tax now. I would see no reason for making any distinction, if the tax on jewelry is to be a separate tax.

SEC. 2402. *Tax on toilet preparations.*—Under the present law this tax is a manufacturers' tax. It is repealed by this proposed measure and made a retail tax by the use of the same language. As in the case of jewelry, a retail tax on toilet preparations will be difficult to administer because of the vast number of retail outlets. The proposed law attempts to reach beauty shops, barber shops, and many types of small stores that keep no records and have no facilities for doing so. Whatever may have been the difficulties encountered in collecting the present manufacturers' tax evasion and collection difficulties will be greatly multiplied if the tax on toilet preparations is made a retail tax.

I mention this because in the Treasury report, I think, there was some mention of the administrative difficulties. It would be increased one-hundred-fold.

The tax should remain a manufacturers' tax, with little disturbance to the existing tax structure and to the established precedents of administrative procedure.

There was no occasion for us to make any recommendations before the Ways and Means Committee because no indication was given that the existing manufacturers' excise tax was to be changed to a retailers' excise tax.

In the event that the taxes on jewelry, furs, and toilet preparations are retained as retailers' excise taxes, we recommend that it be made mandatory in the law that these taxes be shown as separate items on the bill, statement or other evidence of sale.

Your attention is directed to regulations 54, covering the Revenue Act of 1918 which states in part as follows:

* * * The tax is measured by the price for which the article is sold * * * The tax cannot be included in the selling price, but must be billed as a separate item.

We suggest that this or similar language be inserted in the proposed statute. Our reasons are as follows:

(*a*) All vendors would thus be required to administer the collection of the tax in a uniform manner, and no leeway would be given

the vendor to collect and pay the tax to suit his own selling and advertising policies.

(*b*) Protection to the consumer is implemented by preventing misrepresentation or manipulation by some vendors who might reduce the quality of an article to cover the cost of the taxes.

(*c*) Protection to the Government would be insured by requiring proper and adequate itemized records by which the maximum amount of tax could be collected and audited at minimum expense by the Bureau of Internal Revenue, and would assist the Bureau in preventing evasion of the tax.

(*d*) Present retail sales tax laws of many States provide for the listing of the tax as a separate item. The consumer would thus be in a position to check the amount of tax collected.

(*e*) The inclusion of a Federal tax in the sales price, if it is hidden, would result in the imposition of a State or local sales tax upon the Federal tax. Undoubtedly this will lead to confusion and litigation.

Let me illustrate that. If you sold an article for $100 the Federal tax made it $110 and the State tax would be on the $110 instead of the $100, so the amount of the State tax would be $3.30 instead of $3, because of the inclusion of the 10-percent tax.

Senator VANDENBERG. Would this prohibit a manufacturer from absorbing the manufacturers' tax?

Mr. IGLAUER. I am not talking of this as a manufacturers' tax. I am talking of this as if it is a retail tax.

Senator VANDENBERG. Yes.

Mr. IGLAUER. As far as the manufacturer is concerned, I can tell you in 99 percent of the cases, the retailer will have the tax shown on the bill that he gets from the manufacturer.

Senator TAFT. The retailer could absorb the tax by increasing the price of his goods, I suppose.

Mr. IGLAUER. The small dealer gets away with it by representing that he is taking care of the tax.

Senator BARKLEY. Where the manufacturer or a wholesaler sends a bill for consignment of goods with the price without the tax in one column, and with the tax in another column, so the retailer knows what the tax is that has already been paid?

Mr. IGLAUER. Yes. It very frequently comes in on a separate invoice.

Senator BARKLEY. When he sells to the public, the individual consumer, he does not separate it, he adds it all together and prices it in one item, and the tax is added in, is it not?

Mr. IGLAUER. That is correct. As a matter of fact, let us be realists about this. As long as we are going to have these taxes for a good many years and we have to raise a great deal of money the more painless that tax is—the more painless we make this tax, as far as the consuming public is concerned, the better.

Senator BARKLEY. That harmonizes with the Hamiltonian theory that you can tax a coat off a man's back and if he does not know it, he will not kick. All he will do is know that he misses his coat.

If a State levies a retail sales tax, I do not see how you can avoid, in some cases, having a tax upon a tax, because, otherwise, you have got to keep a separate set of books all the way through, from manufacturer down to the consumer.

Mr. IGLAUER. No, no; there may be some States, for instance, that may not show their tax as a separate item. It is supposed to be a privilege tax. In that case there will be litigation, and there has been litigation in Michigan on that very point, because one or the other is a tax on the tax.

There are at least 18 States that I know of, and a great many others I am sure, that have sales taxes in one form or another. If this is made a retail sales tax and, in all cases where it is a retail sales tax, and it is included in the price, the State sales tax will be a tax upon a tax, which I do not think is fair, but if it is shown as a separate item, then you will not have any trouble.

Senator BARKLEY. In order to avoid that, you have got to keep it separate all the way from the manufacturer to the retailer and to the consumer.

Mr. IGLAUER. I am not talking about a manufacturer's tax. I am talking about if this is a retail sales tax. Then it should be shown as a separate item in the customer's invoice or statement. Then there can be no doubt about it.

Senator BARKLEY. If a man is just buying a hat, in some States, the tax is separate. You pay $5 for the hat and 15 cents tax, we will say.

Mr. IGLAUER. That is right.

Senator BARKLEY. And that is put into the little bill that the man gets when he pays for his hat and takes it home with him, but that is not true in all States.

Mr. IGLAUER. Unfortunately it is not. We wish it were.

Senator BARKLEY. If they charge you $5.15, sometimes $5.20 when the tax is only 15 cents, there is no way to protect the public against that, is there?

Mr. IGLAUER. Not in that case.

Senator BARKLEY. All right.

Mr. IGLAUER. We have studied this backward and forward. We have had 22 years of it, and the recommendations we made were made after a great deal of thought and after considerable examination of the question ourselves.

Senator TAFT. Mr. Iglauer, the Ohio method in which the stamp is always added to the price has worked very satisfactorily in Ohio, has it not?

Mr. IGLAUER. For a State tax, it is excellent.

Senator TAFT. That is the same principle you are advocating here?

Mr. IGLAUER. Yes; I want to make that feasible so the auditor does not have to ascertain whether it is hidden or whether it is not. It is always there. It is shown to him and he makes the audit quickly. Every sales check shows it.

If you want to collect the tax, collect it from everybody. Do not let the little dealer, or the midway dealer, the man who thinks he can get away with something, get away without collecting the tax, or give the impression to his customer that he is giving it to him without the tax.

Senator BARKLEY. How would that work where they have tokens?

Mr. IGLAUER. State tokens?

Senator BARKLEY. Yes.

Mr. IGLAUER. The same way as they do in Ohio. It is easy to calculate the tax, because then the Federal tax is the same item as the State tax.

Senator TAFT. In case the manufacturers' sales tax is passed on, there will be a State tax on that tax, will there not?

Mr. IGLAUER. Yes; that is true. Drug preparations are taxed. You cannot avoid that. May I go on, Mr. Chairman?

The CHAIRMAN. Yes, sir.

Mr. IGLAUER. For all of the above reasons, if these taxes are to be imposed upon sales at retail, the National Retail Dry Goods Association urges that it be made mandatory in the law that the retail excise tax be shown as a separate item on the bill, statement, or other evidence of sale.

SEC. 2405. *Leases, conditional sales, etc.*—Section 2405 provides that payments made on leases, contracts for sale, or conditional sales shall be subject to the tax, provided however, that such transaction in respect to which delivery has been made and part of the consideration paid, before July 1, 1941, shall not be subject to the tax.

That was introduced in the committee hearings without an opportunity for us to be heard.

This provision discriminates against purchasers in the lower income groups, inasmuch as their purchases are in effect subject to a retroactive tax.

I have had more letters from the membership on that point than anything else in the law.

For example, purchasers most able to pay avoid the tax by making their purchases for cash or on an open charge account after July 1, and prior to the effective date of the act. Those who have such conditional sales can pay them up right away and avoid paying the tax.

In contrast, a working girl, not having sufficient resources, who makes a purchase of a $35 fur-trimmed coat on a payment plan after July 1, would find that the balance due on the effective date of the act would be subject to the tax. Thus, all such persons of low salary, who buy necessities out of income, such as fur-trimmed coats, would be penalized under the July 1 limitation.

We urge that this discrimination be eliminated by making the following changes:

Delete from line 25, page 78 of H. R. 5417, the words "delivery thereunder was made," and substitute on line 26, page 78, the phrase "prior to the effective date of the act" in place of the words "before July 1, 1941."

Please remember that, while it was known there would be excise taxes, neither stores nor their customers could have foreseen that a retroactive clause on leases, contracts, and conditional sales would be inserted. It is our opinion that customers will question the good faith of retailers in the imposition of the tax and arguments will arise over the completion and delivery of garments, and that repossessions and heavy cancelations of customer purchases may result, if the July 1 date, rather than the effective date of the act is retained.

Summary of recommendations on excise taxes

SEC. 2400. *Tax on jewelry, etc.*—Because of the multiplicity of retail outlets, the difficulty of definition and because of the auditing and administrative problems, this tax should be imposed at the point of manufacture.

If a retail tax on jewelry is to be retained in that form, articles sold at the price of $3 or less should be exempt from the provision of this section to eliminate part of the troublesome administrative problems.

SEC. 2401. *Tax on furs.*—The tax on furs should be imposed at the point of manufacture, because it is only at this point that information as to the taxability of articles made partly of fur is available.

If such tax is to remain a retail tax, the law should provide that the manufacturer specify on the invoice the value of the fur content in relation to other component materials to determine taxability.

SEC. 2402. *Tax on toilet preparations.*—The tax under the present law is a manufacturers' tax and should be continued as such because of the multiplicity of retail outlets.

If these taxes are to be retained as retail taxes we urge that it be made mandatory in the law to show the tax as a separate item on the bill, statement, or evidence of sale.

SEC. 2405. *Leases, conditional sales, etc.*—We recommend that the discrimination against purchasers in the low-income groups be eliminated by amending the section to change the effective date with respect to such leases and conditional sales from July 1, 1941, to the effective date of the act.

In conclusion may I say this—several of the members of our tax committee have been continuously members during all the years in which Federal excise taxes have been levied. We have confined discussion of the bill to matters which seemed to us to be of extreme importance. Like yourselves, we recognize the inescapable necessity of obtaining huge sums to meet the emergency. We are glad to say that our large membership has indicated its willingness to assume its share of the unprecedented burden. Therefore, we are not asking for reductions in that burden—we are asking only for changes which will clarify the act so that we may conscientiously comply with it. We are asking:

1. For simplification of corporation taxes.
2. For an annual declaration of value under the capital stock and declared value excess profits tax.
3. For a provision to amend section 812 of the Revenue Code to exempt from inclusion in the decedent's estate such insurance as is taken out by the taxpayer for the irrevocable purpose of paying death taxes, and
4. That all excise taxes be made taxes at the point of manufacture and not at retail. And we have included important suggestions in connection with excise taxes which are, in our experience, essential to compliance with the law.

We hope you will give consideration to the recommendations herein presented.

Senator VANDENBERG. You have also added orally a fifth recommendation that we substitute for the entire tax structure—a manufacturers' sales tax.

Mr. IGLAUER. We think that would solve a great many of your difficulties, a great many complaints that have been pouring in here, and would solve certainly a great many difficulties for the Bureau of Internal Revenue.

Senator VANDENBERG. I think so too.

The CHAIRMAN. Thank you very much, Mr. Iglauer.

Mr. IGLAUER. I will be glad to answer any questions, if you have any more.

The CHAIRMAN. There seem to be no other questions now.

Mr. Davidson.

STATEMENT OF CLINTON DAVIDSON, JERSEY CITY, N. J., REPRESENTING THE FIDUCIARY COUNSEL, INC.

The CHAIRMAN. Mr. Davidson, you are appearing here for any particular group of taxpayers, are you?

Mr. DAVIDSON. Yes, sir; I represent the Fiduciary Counsel, Inc. of Jersey City, N. J., an investment advisory organization whose clients reside in every section of the United States, and I believe the suggestion I will make is pertinent to every one of them.

I wish to suggest an amendment to section 23 (a) for the purpose of reestablishing a Treasury practice which has existed up to February of this year and which, if not reestablished, will require many people to pay tax on gross income instead of net income.

For many years it has been the policy of the Revenue Bureau to permit individuals to deduct ordinary and necessary expenses which they incurred in producing their taxable income—see I. T. 2751, I. T. 2579 and O. D. 877. Such expenses usually included bookkeeping, stenographic work, office and safety-vault rent, auditing and advisory fees, legal fees, etc. On February 3 of this year, the United States Supreme Court in the case of *Higgins* v. *Commissioner*, disallowed such expenses of Mr. Higgins because of certain technical wording in the act and now individuals who incur expenses in producing their taxable income are, in the majority of cases, forced to pay tax on gross income instead of net income.

The unintentional discrimination under the law as now construed would be most amusing if it were not so serious. For example, a Wall Street investment trust may deduct all of the necessary expenses it incurs in managing and protecting its investments and income, but if an individual owns the same securities—identical in every respect—he may deduct none of these expenses, merely because the individual is not deemed to be carrying on a trade or business within the meaning of section 23. The 1940 statement of Inland Investors, Inc., of Cleveland, shows that this investment trust at the close of the year, had assets totaling $1,560,172, gross income of $135,000, management fees of $5,750, and other expenses of $10,380. All of these expenses were deductible if the income was taxable income. However, if an individual had owned the same securities and had the same expenses, such as investment advice, rent, stenographic services, and so forth, he could have deducted none of these expenses. His tax would have been based on the gross income—the investment trust's on the net.

I hesitated about presenting the next illustration, because at first I thought it was too extreme, but finally decided to do so for the purpose of showing what extremely unfair results are being obtained right now from this unintentional discrimination.

The gambling houses in Reno, Nev., with their roulette tables, dice games, and other gambling equipment, are permitted under the present Revenue Code to deduct bookkeeping, safety-vault, and all of their other ordinary and necessary expenses, but a widow, who is solely dependent upon the income from the securities left her by her husband, cannot deduct bookkeeping, safety-vault, and other expenses essential to the production of her income.

Again anyone may deduct gambling losses to the extent of his gambling gains, but he may not deduct one cent of expenses used for the purpose of investing safely in sound American enterprises. Don't you think that the premium is in the wrong place?

I am certain that the discriminations just mentioned were never so intended by Congress.

The subcommittee of the Ways and Means Committee of the House of Representatives in 1938 recognized the lack of clarity in the law and made the following recommendation:

Recommendation No. 33.—It is recommended that a deduction be permitted under section 23 of the Revenue Act of 1936 for expenses not attributable to the taxpayers' trade or business, but immediately and directly incurred in the collection or production of amounts included in gross income, limited to 50 percent of the amount collected or produced.

Immediate action was not essential then because the regulations and the field examiners treated deductions liberally. I understand that it was decided to postpone action on this recommendation until inquiries could be made of the States that have similar provisions in their tax laws. No doubt you or your advisory committee now have the result of these investigations. I have letters from the tax departments of several States stating that their provision which permits the deduction of these expenses has proven entirely satisfactory.

The Oklahoma Tax Commission wrote on April 23, 1941:

The provision to which you refer has been contained in the Oklahoma income-tax laws since 1933, and its fairness to the taxpayers and the State is shown by the fact that the commission has never recommended that such provision be eliminated to correspond with the Federal statute.

I might say that in Oklahoma these expenses are deductible.

The State Board of Equalization of Montana on April 22, 1941, wrote in reply to the question:

As compared with the Federal provision, has your provision opened the door to tax evasion?

Their answer:

We have never discovered a single case of tax evasion on account of this provision of our law.

Another question:

Has your provision operated fairly to both the State and the taxpayer?

Their answer:

So far as we are able to observe, our law has operated fairly to both the State and the taxpayer. After 15 years of administrative experience in the collection of both Federal and State taxes, we have some very profound convic-

tions that necessary expenses incurred in connection with investments are legitimate and should be allowed to the extent that they are necessary in the same way that a buyer of merchandise or a bill collector for a department store are necessary expenses incurred in producing income.

The Supreme Court decision, plus the present very high rates, make some such legislation imperative. Paying tax on gross income would be bad enough under the old rates, but to refuse the deduction of necessary expenses incurred in producing taxable income under the rates now being proposed is simply inconceivable.

The change which we are suggesting will require practically no change in the administration of the law—and I would like to accent this next remark—and will not deprive the Government of any income it has been receiving heretofore, because the regulations permitted such deductions prior to February 1941. This change will do little more than authorize the Treasury to continue its practice of many years' standing.

The present construction of the law not only affects these taxpayers adversely but it also affects the business of accountants, trustees, lawyers, investment advisers and real-estate owners.

As one example I might mention that many office buildings have been notified by tenants who are dependent upon income from investments, that they can no longer afford to maintain these offices. The same investors have also been forced to discharge employees who have been with them for many years.

The following form of suggested amendment is, we believe, one method of revising helpfully the present situation.

We are not urging that this particular amendment which I am about to read be adopted, but this is one method.

SUGGESTED AMENDMENT TO SECTION 23 OF THE INTERNAL REVENUE CODE

SEC. 23. Deductions from gross income.

In computing net income there shall be allowed as deductions:

(*a*) *Expenses.*

* * * * * * *

(3) *Nonbusiness expenses.*—All the ordinary and necessary expenses paid or incurred during the taxable year, other than those paid or incurred in carrying on any trade or business, to the extent that such expenses were paid or incurred with respect to the production or collection of, or to the management, protection, or conservation of property-producing income required to be included in gross income under this chapter.

I might further suggest that you give some consideration to making retroactive whatever provision you may decide upon. Otherwise, there will be a small gap during which taxpayers will be taxed on gross income, while those both before and after will be taxed on net income. Such retroaction should, I believe, greatly simplify the administration of the provision.

May I take a minute to summarize?

SUMMARY

1. The deduction of such expenses has been permitted for many years and has become a well-established practice.
2. If discontinued, it would require many taxpayers to pay tax on gross rather than net incomes.
3. The discrimination which permits an investment trust and a Nevada gambling house to deduct necessary expenses, while refusing the same deduction

to men and women who are solely dependent upon the production of taxable income from their investments, and which permits deduction of gambling losses without permitting expenses incurred in investing in sound American enterprises is unfair and was never so intended by the Treasury nor by Congress.

4. The extremely high rates now being proposed make the deduction of proper expenses more essential that ever before. It is imperative now and if not allowed, would be grossly unfair and would work serious hardships in many cases.

5. The statutes of several States permit such deduction and their experience under these statutes have been entirely satisfactory.

6. The amendment suggested would not result in the loss of revenue as compared with that collected heretofore, because such deductions have been permitted up to February 3, 1941.

7. I do not believe that your committee, the Treasury, nor Mr. Stam's staff can object to a change in the law which will result in reestablishing the Treasury practice.

I might say that I have discussed this subject with men in the Treasury staff, and with some of Mr. Stam's staff, and I have found no objection whatsoever to this general idea.

The CHAIRMAN. Have you finished your statement?

Mr. DAVIDSON. Yes.

Senator TAFT. Can the Treasury go back to 1940 and collect the additional taxes on account of this disallowance?

Mr. DAVIDSON. Yes; I think the examiners are so instructed. We find, from reports from all sections of the country that the deduction of such expenses is not being allowed on returns made in March of this year. On all returns that are coming up before the examiners, they are no longer permitting the deduction.

The CHAIRMAN. Mr. Davidson, you appeared before the House committee, I notice from the report. You covered this same question, did you not?

Mr. DAVIDSON. Yes, sir.

The CHAIRMAN. And the House made no amendment, the House did not make the amendment that you were urging?

Mr. DAVIDSON. That is right, sir. The reason I was told was that the House was not considering any administrative measures, but every member of the Ways and Means Committee with whom I discussed the matter agreed it was proper, and several said if administrative measures were agreed upon by the committee to be acceptable, they themselves were in favor of it.

The CHAIRMAN. You gentlemen of the Treasury will note this particular suggestion in this amendment so we may hear from you perhaps later on about it.

Thank you very much, Mr. Davidson. We will have time for one other witness before lunch.

Mr. Edwards.

Will you give your name to the reporter, please?

STATEMENT OF WALTER A. EDWARDS, PROVIDENCE, R. I., REPRESENTING THE PROVIDENCE & WORCESTER RAILROAD CO.

Mr. EDWARDS. My name is Walter A. Edwards. My address is 15 Westminster Street, Providence, R. I. I have a copy of my statement, if you care for it.

The CHAIRMAN. Would you care to present your statement as a whole, or put it in the record and make such comments as you wish?

Mr. EDWARDS. I think the subject matter of it is such that I had better present it as a whole.

The CHAIRMAN. Very well.

Senator BARKLEY. Do you represent any particular organization?

Mr. EDWARDS. Yes; I appear in behalf of the Providence & Worcester Railroad Co., which is one of the leased lines of the New York, New Haven & Hartford Railroad Co. It had been planned that I should appear this morning with Mr. Anton P. Wright, of Savannah, whose statement was to supplement my statement, to a certain extent. We had worked together to some extent in the preparation of it. He has been unable to appear this morning, but I understand will appear next week.

The CHAIRMAN. He will apear at a later date; yes.

Mr. EDWARDS. I simply want to call attention to the fact that our statements each supplement the other to a certain extent.

The CHAIRMAN. Yes, sir.

Mr. EDWARDS. The proposal which I am to make is one which I submitted at the public hearings of the Committee on Ways and Means of the House of Representatives on the revenue bill. Since it was not embodied in that bill I desire to repeat it here.

At the outset, let me say that I recognize the need for a drastic increase in the income tax. Yet I believe that this need should not preclude changes in the present income-tax law which would prevent injustices to the taxpayer, particularly in cases in which such injustices may be prevented at a relatively small cost to the Government.

For many years it was controverted between the Government and the taxpayer whether improvements to leased premises made by the lessee at his own expense and becoming the property of the lessor give rise to taxable income to the lessor either during the continuance of the lease or at its expiration or sooner termination.

In 1938 in *M. E. Blatt Co.* v. *United States* (305 U. S. 267), the Supreme Court held that such improvements do not give rise to taxable income to the lessor during the continuance of the lease. In 1940 in *Helvering* v. *Bruun* (309 U. S. 461), that court decided that such improvements give rise to taxable income to the lessor upon the premature termination of the lease to the amount which they add to the value of the leased property, and the Court's reasoning was such as to compel the conclusion that such improvements also give rise to taxable income to the lessor to the same amount upon the expiration of the lease if it expires by its terms instead of being prematurely terminated. By T. D. 4980, approved July 2, 1940, the Treasury Department gave effect to this decision of the Supreme Court by a regulation applicable both in the case of a premature termination of a lease and in the case of the expiration of a lease.

The question which confronted the Supreme Court in *Helvering* v. *Bruun* was a question of legal interpretation, viz, whether in the circumstances of that case, the lessor received income within the meaning of the sixteenth amendment. The question which confronts us here is whether the law as interpreted by the Supreme Court produces a just and desirable result and it is to that question that I shall now address myself.

There is a serious objection to treating improvements to leased premises made by the lessee at his expense and becoming the property

of the lessor as giving rise to taxable income to the lessor, either upon the expiration or upon the sooner termination of the lease. This objection arises from the fact that the leased property with the improvement at the expiration or the sooner termination of the lease may be and frequently actually is worth less than the cost of the leased property to the lessor or than the value of the leased property without the improvements at the commencement of the lease. Indeed, in the case of the premature termination of a lease—which, of course, is generally an event occurring because of the lessee's default—this is particularly apt to be the case since leases are most often terminated for the default of the lessee during periods of business depression. Yet the taxable income received by the lessor equivalent to the amount added to the value of the leased property by the improvements is not allowed to be offset by any shrinkage in the value of the leased property itself. The result is that the lessor is taxed as the recipient of the income arising out of the improvements when the result of those improvements is merely to diminish his impoverishment. In other words, in substance the lessor is taxed not because of his enrichment but because of the reduction of his impoverishment.

Moreover, treating improvements to leased premises made by the lessee at his expense and becoming the property of the lessor as giving rise to taxable income to the lessor, either upon the expiration or upon the sooner termination of the lease, is open to the objection that the amount of the tax is dependent upon the valuation placed upon the contribution made by the improvements to the value of the composite unit consisting of the leased property and the improvements; and it is often very difficult and sometimes impossible to determine what value should be assigned to that contribution. For example, let us take the case of a railroad which has been leased for a term of 99 years by a lease under which the lessee covenants at its own expense to make all necessary additions, betterments, and improvements and these are to become the lessor's property.

Many years pass; yards have been relocated, heavier rails have been laid, new signal systems have been installed, and new stations and other facilities erected and all the improvements necessary to adapt the road to changing conditions have been made. Mr. Wright, the president of Southwestern Railroad Co., which owns a railroad leased to Central Railway of Georgia, who will appear later at these hearings, will give you an actual example of such a case.

How much do all these changes contribute to the value of the railroad at the time the lease expires or is terminated? Nothing less than a complete and very expensive engineering study would furnish any answer to this question, and it may be doubted whether even such a study would furnish a satisfactory answer. In cases in which valuation is difficult the Commissioner of Internal Revenue is likely to make a somewhat arbitrary valuation which the taxpayer will be unable successfully to contest because of the presumption which the courts have held to exist in favor of the correctness of the Commissioner's action. In saying what I have said, I realize, of course, that no income tax law (especially no income tax law which takes into

account gains or losses on capital transactions) can be so framed as entirely to avoid difficult questions of valuation which can be solved only by conjecture. But surely the cases in which such questions may arise should be limited so far as possible.

There is also a third objection to treating improvements of the class under consideration as giving rise to taxable income to the lessor. Although, as I shall later explain, I do not believe that in the aggregate the Government will profit much from the decision in *Helvering* v. *Bruun*, in any particular case the tax imposed in reliance on that case is likely to be entirely disproportionate to the taxpayer's cash receipts at or about the time of the imposition of the tax. It is therefore, a tax for which it should be possible to make adequate provision in advance by means of a sinking fund out of earnings. Yet this cannot be done. If the lease is prematurely terminated, no such provision can be made, for the time when a lease will have to be terminated for the lessee's default cannot be foreseen. Even if the lease expires in accordance with its terms, it is impossible to foresee what values or tax rates will be at a time many years in the future or, in the case of a railroad or public utility lease, what improvements the lessee will make; and this impossibility prevents the computation (except by mere guess work) of the amount for which provision should be made by way of a sinking fund.

The three objections, which I have mentioned, to treating improvements to leased property made by the lessee at his own expense and becoming the property of the lessor as giving rise to taxable income to the lessor apply whether the lease expires according to its terms or is prematurely terminated. There is another objection which applies to treating such improvements as giving rise to taxable income to the lessor upon the premature termination of the lease. As has already been pointed out, such a termination is generally because of the lessee's default. Defaults by lessees are most likely to happen during periods of business depression. Consequently, the tax is apt to fall upon the lessor at a time when he is least able to meet it—at a time when very probably he can find no new tenant or has had to make a new lease of his property at a much reduced rent.

Whether or not the decision of the Supreme Court in *Helvering* v. *Bruun* was necessitated by the absence of any express statutory provision relating to the problem with which it dealt, the objectionable results of that decision indicate that the imposition of an income tax in accordance with the Treasury decision based thereon is unjust and undesirable and that there is need for a legislative remedy which will exclude from gross income income received by a lessor upon the expiration or termination of a lease by reason of additions, betterments, or improvements made to the leased property by the lessee. But it will be asked whether such a remedy would not prove expensive to the Government at a time when it cannot afford to lose any tax revenues. I do not believe that it would; and I shall attempt to justify this belief by showing the probable results of the application of the Treasury decision to three classes of cases which certainly include most of the cases coming within its scope.

The first class of cases consists of leases of land under which the lessees have erected buildings. In these cases, when the lease expires,

the building erected by the lessee is apt to have become so obsolete as not to add much to the value of the land and, therefore, not to result in a substantial tax. Nor do I think that upon the premature termination of a lease of this class for the default of the lessee, a substantial tax by reason of the building erected by the lessee is likely to be collected. My belief is that the result of the application of the Treasury decision would be that a lessor of this class coming within its scope, instead of terminating a lease for the lessee's default, would resort to some elaborate transaction to avoid the tax or would temporize or compromise with the lessee.

The second class of cases consists of leases of store property to merchants who have made improvements to the stores. Such improvements, I believe, are apt to become obsolete so quickly that they rarely add much to the value of the leased property. Moreover, if they do add to that value, it is difficult to determine how much they add. Consequently, it seems probable that the revenue derived from the Government's taxing what they add to the leased property would be small and would be obtained at substantial administrative expense.

The third class of cases consists of leases of railroads and public utilities which provide that the lessee shall make all necessary additions, betterments, and improvements. I believe that in general such leases have been made at such times and for such periods that they will not begin to expire for many years. The Treasury decision would certainly operate to prevent their termination because of defaults by the lessees.

Certainly a consideration of these three classes of cases indicates that legislation excluding from gross income, income received by a lessor upon the expiration or termination of a lease by reason of additions, betterments, or improvements made to the leased property by the lessee would involve no serious loss of revenue to the Government.

Such legislation may be simply expressed. Subsection (b) of section 22 of the Internal Revenue Code, as heretofore amended, lists in nine paragraphs certain items which are not to be included in gross income and are to be exempt from income tax. All that is necessary is to amend this subsection by adding at the end thereof a new paragraph reading as follows:

(10) Income received by a lessor upon the expiration or termination of a lease by reason of additions, betterments, and improvements to the leased property made by the lessee.

If such an amendment were adopted, paragraph (c) of section 721 which treats similar income as abnormal income for the purposes of the excess-profits tax, could be stricken out.

I most respectfully submit and most earnestly urge that in the revenue bill of 1941 subsection (b) of section 22 of the Internal Revenue Code, as heretofore amended, be amended by the addition of the paragraph which I have just mentioned.

The CHAIRMAN. Are there any questions?

Senator DANAHER. I have one, please.

The CHAIRMAN. Yes.

Senator DANAHER. I want clearly to understand that this income is treated as income and is imposed only for the year when the lease expires either by termination or default.

Mr. EDWARDS. That is so under the present decisions of the Supreme Court. There is no income realized by reason of the improvements under those decisions during the continuance of the lease.

The CHAIRMAN. Thank you very much, Mr. Edwards. The committee will recess until 2 o'clock.

(Whereupon, at the hour of 12:35 p. m., the committee recessed until 2 p. m., the same date.)

AFTERNOON SESSION

(Pursuant to adjournment, the committee resumed the hearing at 2 p. m.)

The CHAIRMAN. The committee will come to order. I believe Mr. Parton is next on the list.

STATEMENT OF GEORGE F. PARTON, NEW YORK, N. Y., MEMBER, EXECUTIVE COMMITTEE, NATIONAL SAFE DEPOSIT ADVISORY COUNCIL; PRESIDENT, NEW YORK STATE SAFE DEPOSIT ASSOCIATION

Mr. PARTON. My name is George F. Parton. I am appearing before you as a member of the executive committee of the National Safe Deposit Advisory Council, and also as president of the New York State Safe Deposit Association. Both are nonprofit associations, for the promotion of the general welfare of the safe-deposit business. I have prepared a statement, Mr. Chairman, which I should like to read, and I have also filed with the clerk copies of this statement for members of the committee.

The CHAIRMAN. Do you wish to enter the statement in the record?

Mr. PARTON. Yes, sir; I should like to do that.

The CHAIRMAN. Then discuss the matter?

Mr. PARTON. Yes; I should like to read the statement at this time.

The CHAIRMAN. You may do that; you may proceed.

Mr. PARTON. The membership of the National Safe Deposit Advisory Council consists of 25 State associations, which include in their respective memberships many hundreds of individual safe deposit companies. These State associations are located throughout the United States from New England to California.

One of the members of the advisory council is the New York State Safe Deposit Association of which I am president, and which in itself has a membership of over 500 safe-deposit companies in 34 States of the Union.

In addition, I am appearing before you on behalf of the 4,500,000 renters in the United States of safe-deposit boxes, for they are the people who pay this particular tax which I wish to discuss.

At the outset I should like to place in the record that the entire safe-deposit industry is wholeheartedly behind the present effort of the Government to raise every possible dollar by taxation and to raise it as quickly as possible, to help finance national defense. We believe there is no problem today which is of more vital importance. Therefore, whatever is said in this statement should not be interpreted as an effort on behalf of our industry to, in any way, sidestep our patriotic duty in this respect. We expect and we desire to do our full share.

It is proposed in the present tax bill to increase the tax on safe-deposit box rentals from 11 to 20 percent. This tax was first enacted in 1932, at the rate of 10 percent, as an "emergency" measure and it was generally understood at that time that the tax would expire when the emergency ended.

Senator VANDENBERG. When was that?

Mr. PARTON. I do not know, sir; I understand it is still continuing.

On each of the subsequent expiration dates the tax has been extended and in 1940 it was increased to 11 percent.

New excise taxes at the rate of only 10 percent are proposed on sporting goods, luggage, electrical appliances, photographic apparatus, business and store machines, rubber products, commercial washing machines, and optical equipment. In addition, the bill imposes a new excise tax of only 10 percent upon the retail sale of jewelry, furs, and toilet preparations.

The following are proposed increases in existing rates:

Passenger automobiles and motorcycles, from 3½ to 7 percent.

Trucks, from 2½ to 5 percent.

Parts or accessories, from 2½ to 5 percent.

Radio sets, phonographs, phonograph records, automobile radios, and musical instruments, from 5½ to 10 percent.

Refrigerators and air conditioners, from 5½ to 10 percent.

The proposed increase in the rate on safe-deposit-box rentals is from 11 to 20 percent and we cite these other instances in the bill because the safe-deposit rate is double most of them. In some cases, it is considerably more than double, and in no case is it less than double. In no other industry mentioned in the entire tax bill is the proposed excise-tax rate as high as that on safe-deposit box rentals.

The amount which it is expected to realize from this increased safe-deposit tax is $1,700,000, a relatively insignificant amount of money compared to the total amount to be raised. There are in fact only three items in the bill on which the estimated revenue is less, namely: Playing cards, on which the estimated yield is $1,000,000, representing an increase in the present rate from 11 to 13 cents; optical equipment, estimated to yield $1,000,000, representing a new tax of 10 percent; and washing machines (commercial) estimated to yield $1,100,000, representing a new tax of 10 percent.

In each of these three cases the proposed rate is very considerably less than on safe-deposit box rentals.

Is it equitable that there should be such discrimination between our industry and all these others which I have cited? I beg to submit that this is not in accordance with the statement made by the Ways and Means Committee that it has been their "aim and desire to distribute the additional tax burden as equitably as possible among the several classes of taxpayers." I also believe that, regardless of how large or how small may be the amount of revenue which it is hoped to receive from any one industry or commodity, it is not equitable to single out one of the smallest industries, from the point of view of tax revenue, on which to impose the highest tax rate.

In our opinion it is inconsistent and misleading to classify safe-deposit boxes as "luxuries," similarly as liquor, tobacco, cosmetics,

and so forth. Actually a tax on the rental of a safe-deposit box is a tax on the protection of valuables, and we believe it quite unfair to regard it as a luxury to rent a safe-deposit box.

In this connection it has been estimated by competent authorities that about 90 percent of all the box renters in the United States rent boxes averaging $4 a year. These box renters are not wealthy people; in the main, they are the people of small means and of the middle classes. They are not the people with stocks and bonds; they rent their boxes to put a savings bank passbook in, or a life-insurance policy, or a deed to their home. Their safe-deposit box is not rented as a luxury, but solely as a means of protection for their small possessions. It is conceded that the remaining 10 percent of the renters in the country may have more wealth to protect, but again, it is protection which they seek and I submit that the habit of protecting one's possessions is not something which should be penalized by heavy taxation. We believe that the protection of one's valuables, particularly in precarious times like the present, is a laudable objective and that it should be encouraged rather than discouraged.

Every method possible has been stressed by the Treasury Department to encourage the people to buy defense bonds. Nothing therefore should be done to build up sales resistance to this effort. But, if a man or woman is forced to give up his or her safe-deposit box because of an exorbitant tax on the rental thereof, the Government will, in a great many instances, lose that person as a potential purchaser of those bonds. If it may be argued that defense bonds will be held by the Federal Reserve banks free of charge, the purchaser will still want some secure place in which to keep his receipt for them. He will more frequently, however, wish to have physical possession of them. This was proven during the Liberty Loan period of the last war, when comparatively few purchasers availed themselves of the offer at that time of mutual savings banks to take care of the bonds without charge. Most of the Liberty Loan bonds were placed in safe-deposit boxes from which they could be removed by the owners at any time.

Purchasers of defense bonds will also wish to place them in their own safe deposit boxes. But without safe deposit boxes to place them in they are not as likely to be prospective purchasers.

There has been voiced general opposition to the proposal that a Federal general sales tax be levied on the grounds that it would severely penalize persons of moderate incomes. Yet it has been carefully estimated, as stated above, that about 90 percent of the entire number of box renters throughout the United States are people of small means. The well-known firm of McCann-Erickson, Inc., made a survey for our association a few years ago which showed that there were approximately 11,000,000 safe deposit boxes in the United States of which only 40 percent or 4,400,000 were rented. Therefore it will be approximately the 4,000,000 people of modest means and small incomes, constituting the 90 percent of all the box renters, who will be the ones severely penalized by this proposed tax.

From the economic standpoint, it is our belief, based upon facts and opinions gathered from all over the country, that the imposition of a 20 percent tax on safe deposit box rentals will defeat the purpose for which it is intended, for the reason that many thousands of the renters of the larger boxes will take smaller space, and also

because a great many of the little boxes will unquestionably be closed out entirely by people who will take their small possessions home, or otherwise endeavor to protect them, rather than pay such an exorbitant tax. In our opinion, therefore, the Government will fall far short of receiving the anticipated $1,700,000. In addition, the net profits which the individual safe deposit companies earn will be so reduced because of this loss of business that the Government will receive far less than it is receiving at present from corporate income taxes.

Throughout the Nation the safe-deposit industry will receive a crippling blow if this 20-percent tax is approved, and the question we wish to submit in this regard is whether it is right that any one industry, regardless of how large or how small it may be, should be entirely disrupted, causing unemployment, and so forth, just in the hopeful expectation that the Government may receive through that source a million dollars or so. Is that a fair price to pay for such a relatively small sum of money, speaking relatively, of course, in relation to the entire tax picture? It is our view that an industry which is dedicated to encourage savings, thrift, and protection is one which should be encouraged in wartimes rather than crippled.

Attached to this statement is copy of a letter which I mailed on August 7 to Mr. Roy Blough, Director of Tax Research of the United States Treasury Department, in which are given several facts to confirm our opinion that the Government will not receive the hoped-for revenue from this source, and that in addition, the industry itself will be dealt a most severe set-back at a time when its business throughout the country is at an extremely low ebb.

But perhaps, more important than the effect of this tax on the industry itself is the effect it will have on 4,000,000 of the middle-class people of the country, not only because the tax will be a distinct hardship to them to pay, in addition to all their other taxes, but also because it will react as an encouragement to these people to get away from the habit of protecting their savings and other valuables. In times like the present, we believe this would be extremely short-sighted policy. At the expense of repetition we again say that people should be encouraged in wartimes to protect their valuables, not to do anything which would tend to weaken that protection. Even in normal times they should be so encouraged.

Again we would stress that safe deposit box renters have already been paying this tax for nearly 10 years. We feel therefore, that they and we have been doing our part, and incidentally, it might also be mentioned that it costs the Government practically nothing to collect this tax, for we act as their collecting agents. We collect the money free of cost to them and remit the recollections each month, thereby saving the Government an immense amount of detail and expense. We are, of course, willing and anxious to contribute our fair share toward national defense, but we claim that our share should be on an equitable and fair basis. At the prevailing rate of 11 percent the tax is already in excess of most of the other excise taxes proposed in the bill. At 20 percent it would be the highest rate. We claim that this is neither fair nor equitable and we therefore most

earnestly recommend that the present rate of 11 percent be not increased. It should indeed be reduced to 10 percent to correspond with the other comparable ex e taxes as listed in the bill.

Mr. Chairman, I should like also, if I may, to read the letter to Mr. Roy Blough, to which I have made reference. It will not take more than a few minutes.

The CHAIRMAN. All right. Please be as brief as possible. We haven't placed any time limit, but we have a great many witnesses here.

Mr. PARTON. If you would prefer, I will not read it.

The CHAIRMAN. No; you may read it, particularly if it deals with matters other than those you have touched on.

Mr. PARTON. It does.

AUGUST 7, 1941.

Mr. ROY BLOUGH,
Director of Tax Research, United States Treasury,
Washington, D. C.

DEAR MR. BLOUGH: In compliance with your suggestion last Tuesday morning when I had the pleasure of discussing with you the proposed increase in the tax on safe-deposit box rentals, I give you below certain facts and information which have a bearing on this question.

A survey made within recent years by the well-known firm of McCann-Erickson, Inc., showed that at the time of the survey there were approximately 11,000,000 safe-deposit boxes in the United States. Of these about 40 percent or 4,400,000 were rented and the balance vacant.

Since that time figures of the Internal Revenue Bureau show that the gross income from safe-deposit box rentals has declined, from which it is evident that less than 4,400,000 boxes are rented at the present time.

According to the above-mentioned survey the average rental paid on those 4,400,000 boxes was $4 per annum.

It has been estimated that those who rent these boxes averaging $4 per annum constitute approximately 90 percent of all the box renters in the United States.

The survey also states that 87.2 percent of all box renters place insurance policies in their boxes; 67.5 percent place deeds to real estate; 57 percent place wills; 36.7 percent place contracts; 35.1 percent place jewelry, and lesser percentages apply to canceled checks, income-tax returns, heirlooms, birth certificates, and so forth. These facts are mentioned to show that safe-deposit boxes are used in very large measure for the protection of valuables other than securities.

Another point brought out in the survey is that 42.5 percent of all box renters have locked boxes of one form or another in their homes, from which it may be assumed that large numbers of the small-box renters will use those locked boxes in their homes for their valuables rather than retain their safe-deposit boxes and pay a 20-percent tax on the rental thereon.

It is stated that 41 percent of the box renters also keep personal possessions in their office safes, another reason to believe that many will close out their safe-deposit boxes and use the office safe rather than pay a 20-percent tax on the former.

In the opinion of safe-deposit and bank officials throughout the country, a 20-percent tax on safe-deposit box rentals will react as definite sales resistance against the purchase of defense bonds, inasmuch as there will undoubtedly be many who would purchase those bonds if they had a safe-deposit box to put them in, but who would refrain from purchasing them if they had no safe-deposit box. This statement is taken from the experience of the World War, when most of the Liberty Loan bonds sold at that time were placed in safe-deposit boxes from which they could be removed by the owners at any time, and this notwithstanding the offer of the mutual savings banks at that time to take care of the bonds free of charge similarly as the Federal Reserve banks are offering this service at the present time. Purchasers of defense bonds should not, in our opinion, be taxed for protecting them.

The safe-deposit business generally has been on the decline ever since the tax on box rentals was first imposed in 1932, as will be shown from the following figures obtained from the Internal Revenue Bureau:

Year ended June 30, 1933 (including collections of June 21, 1932, and thereafter—in other words, 1 year and 10 days)	$23,650,408.30
Year ended June 30, 1934 (bank holiday and gold hoarding)	27,158,506.70
Year ended June 30, 1935	23,176,193.00
Year ended June 30, 1936	19,974,096.70
Year ended June 30, 1937	20,397,143.70
Year ended June 30, 1938	20,131,587.30
Year ended June 30, 1939	19,805,250.30
Year ended June 30, 1940	19,889,337.90

The above figures indicate that there was a considerable jump in the gross income from safe-deposit box rentals during the year ended June 30, 1934, which we believe was largely and directly traceable to the gold-hoarding and bank-holiday period. This increase was, however, more than wiped out the following year and the figures will show that as of June 1940, there was a decrease in gross income from rentals of $7,269,000 from the high point over these past 8 years. If the 20-percent tax is placed on these rentals, the business will unquestionably be further reduced.

In our opinion, although we have no specific facts to substantiate it other than plain human nature, if the 20 percent is imposed, those who have the larger-sized boxes, as well as those who have the small ones, will examine them with the view of placing the contents in smaller boxes. This procedure will operate all along the line from the company or firm which rents a $500 box on down to those who rent the $3 box, and in our judgment many of those who rent the smallest size boxes will close them entirely rather than pay the tax. This was the experience of safe-deposit companies all over the country when the 10-percent tax was first imposed in 1932, although no actual figures are available to prove exactly how many of such boxes were reduced or closed out because of the tax. But every safe-deposit company to which I have made inquiry has stated that its experience was that their business fell off immediately after the tax was imposed.

A further falling off in business, which unquestionably will follow the increase in the tax to 20 percent, will result in less corporate income taxes paid to the Government by the safe-deposit companies.

Apart from the above there will, in our opinion, be extremely little likelihood of the Government raising the $1,700,000 from the tax on rentals because of the fact that so many of the little boxes will be closed out entirely.

Summing up, it is our best judgment, based upon facts and information obtained from safe-deposit companies over the entire country, that should this 20-percent tax be imposed the Government will fall far short of raising the additional revenue hoped for, and not only will this be true but the safe-deposit industry itself will come close to being crippled, with resulting unemployment in many of the companies, inasmuch as practically no safe-deposit company is making any money to speak of these days. We do not believe the Government would willingly be responsible for disrupting a national industry, small though it may be, just for the sake of raising a possible million dollars or so, especially when over 4,000,000 people of the middle classes would be the ones primarily affected.

The safe-deposit industry is in full sympathy with the Government's efforts to raise every dollar possible through taxation, but we submit that to increase by nearly 100 percent a tax which has already been in force for nearly 10 years, is not equitable or fair, nor is it at all in line with the proposed taxes on other lines of business as shown by the pending tax bill.

Yours very truly,

GEORGE F. PARTON, *President.*

Mr. PARTON. That concludes my statement.

The CHAIRMAN. Any questions?

(No response.)

The CHAIRMAN. Thank you very much, Mr. Parton.

Mr. PARTON. Thank you, sir.

The CHAIRMAN. Mr. John W. Hart.

STATEMENT OF JOHN W. HART, KENDALLVILLE, IND., PRESIDENT, COMMERCIAL REFRIGERATOR MANUFACTURERS ASSOCIATION

The CHAIRMAN. Mr. Hart, will you give your name to the stenographer?

Mr. HART. My name is John W. Hart. I am president, Commercial Refrigerator Manufacturers Association, about 30 members, who produce about 85 percent of the total commercial refrigerators in the United States.

Now, we have a brief which we are passing around and we would like to have it in the record. I have with me Mr. Sullivan, secretary of the association, who has all the statistics pertaining to our business. After reading this brief, we will be very glad to answer any questions and, with your permission, Mr. Chairman, and members of the Senate Finance Committee, I would now like to read this brief.

The CHAIRMAN. You would like to read it rather than comment on it?

Mr. HART. I would like to read it, and if there are any questions we would like to answer them. We think we have some very good points which perhaps you would like to hear and then ask some questions about.

The CHAIRMAN. Proceed.

Mr. HART. This presentation pertains to the proposal now before this committee under which section 3405 of the Internal Revenue Code is amended to read as follows:

SEC. 3405. *Tax on refrigerators, refrigeration apparatus, and air conditioners.*—There shall be imposed on the following articles (including in each case parts and accessories therefor sold on or in connection with the sale therefor) sold by the manufacturer, producer, or importer a tax equivalent to 10 percent of the price for which so sold:

(a) *Refrigerators, etc.*—Refrigerators, beverage coolers, ice cream cabinets, water coolers, food and beverage display cases, food and beverage storage cabinets, each such article having or being primarily designed for use with a mechanical refrigerating unit operated by electricity, gas, kerosene, or gasoline.

As representatives of the manufacturers of commercial refrigerators, a type of refrigerated equipment generally designated by that name, we respectfully object to that portion of the above-quoted general application which, although not describing commercial refrigerators specifically, suggests that it is the intent of this proposal to impose the 10-percent excise tax on all such products. This inference is conveyed in the reference to "refrigerators" and "food and beverage display cases" and to "food and beverage storage cabinets."

The foregoing terminology is not clear, inasmuch as we know of no commercial refrigerator or refrigerated store fixture designed for the combined display or storage of both food and beverages, if by the term "beverage" is meant soft drinks, beer, or liquid beverages other than milk or similar liquid foods. These questions of phraseology will be recognized as technicalities only. However, we cite them at this point with the thought that if it had been the intent of the framers of this bill to impose a tax upon the type of equipment manufactured by your petitioners, the proper distinction between commercial refrigerators and the other types of refrigerated equipment contemplated in the measure would have been clearly drawn.

Therefore, we cannot overlook the possibility that such was not the

intent, and that reference to "food and beverage display cases" or "food and beverage cases" was merely an attempt to clarify the application of the tax to a type of refrigerated storage and display cabinet or case commonly designated as a "beverage cooler," from which soft drinks are usually dispensed and sold in taverns, confectioneries, filling stations, and so forth.

A "commercial refrigerator" in the sense that we will use the term in this presentation, refers to such equipment used in retail food and meat stores, hotels, restaurants, hospitals, and other institutions as (*a*) cabinets or cases wherein perishable foods are protected against spoilage, and maintained at healthful temperatures until consumed or sold, (*b*) storage cabinets used for the same purpose, (*c*) refrigerator cabinets or cases specially designed for the safe storage and display of foods requiring particular temperature and humidity conditions, as in the case of fresh fruits and vegetables, milk, butter, cheese, etc., (*d*) cooling rooms or compartments of the portable type for the storage of perishable foods in large quantities, and (*e*) refrigerated cabinets for use in hospitals or other institutions for the preservation of serums, pharmaceuticals, "blood banks," and so forth.

It should be apparent from the above definition of our products that if the proposed excise tax is to be assessed against them, it will be placing a burden on two most vital factors in our national economy—food and the public health—both of which constitute America's first line of defense in the present emergency. We recommend, therefore, that if this committee is satisfied that it was not the intent of the authors of the bill to impose a tax on commercial refrigerators, the present phraseology of the questioned provision be clarified by eliminating all reference to food, or the use of the word "case" in describing any of the products intended to be covered. However, if the committee is not of this view and feels that commercial refrigerators should be subject to the tax, we offer the following reasons why we believe such a step is unjust and unsound:

I. *This tax is equivalent to a tax on food.*—There are approximately 500,000 retail food merchants in the United States, plus some 200,000 restaurants, hotels, and other establishments where food is stored under refrigeration for ultimate sale or consumption. The commercial refrigerator is the final link in the chain of distributive processes required to bring perishable foods from their point of origin to the point where it passes into the hands of the ultimate consumer. If this link is broken, as it will be if burdened with the proposed tax, it means that either or both of two things will result:

1. The retail food merchant or other purveyor of perishable foods will unquestionably pass on the tax, as reflected in the increased cost of his refrigerated equipment, to his customers—the 130,000,000 people who use the retail food store as their daily market basket. This can only mean higher food prices—at a time when every effort is being made to keep living costs from soaring. As with any other factor adding to the cost of our one indispensable living necessity, this tax will fall disproportionately on that vast segment of our population that is least able to shoulder the burden.

Sixty-two cents of every dollar spent for food on the American dinner table goes for perishable food—meats, vegetables, fruits, and

dairy products. Already burdened with mounting costs and narrowing profit margins, the average retail food distributor will have no recourse than to pass on the full amount of any addition to the cost of his essential investment in refrigerated equipment—for in order to remain in business and comply with American standards of health and sanitation, every food merchant or other purveyor of foods must make use of one or more types of commercial refrigerator.

2. Due to the increased cost of new refrigerated equipment, no doubt many food distributors will strive to get along with equipment that, by reason of age, obsolescence, and wear, is no longer capable of maintaining food under proper conditions. On an average, the retail-food merchant finds it advisable to replace his refrigerated equipment about every 10 years. Thus, in each year many thousands of commercial refrigerators have reached the point where they can no longer be used without endangering the health of the public. We are of the opinion that the deterrent effect which the increased cost of such equipment will exert on this normal replacement policy will be great, and that a very real health hazard is involved.

Marriner S. Eccles, Chairman of the Board of Governors of the Federal Reserve System, in commenting on the effects of the defense program on our national economy, is quoted as saying:

> Low-income groups should not be made to make sacrifices in food, clothing, and other necessities, for they have had too little. The sacrifices must come from the more fortunate groups. Those who can get along with fewer automobiles and other goods needed for defense, but not essential for civilian well-being.

We are told by the same source that "nutrition has become a matter of national policy" and that nothing must interfere with the Nation's task of giving food priority as a war expedient, just as it should command the same priority in peacetime. These views, we feel, are indisputably sound and have a direct bearing on our own contentions here that the adoption of any measure that will have the effect of raising the cost of essential living necessities should be avoided.

Senator DANAHER. Right there, Mr. Chairman, I would like to ask a question. What percentage of your sales are installment sales?

Mr. HART. The percentage of the sales is about 70 percent.

Senator DANAHER. There was a report today that by Executive order, the President had conferred on Marriner Eccles power to suppress all installment sales. Won't that have an effect, more so than this tax, of discouraging sales?

Mr. HART. You mean suppress all installment sales?

Senator DANAHER. Well, the power——

Mr. HART. A tightening up. I may say that our industry has already begun to put its house in order by requiring larger initial cash payments with a shorter time to pay the balance. The C. I. T. has already tightened up in New York City.

Senator TAFT. That is, has tightened the terms?

Mr. HART. Yes.

Senator DANAHER. Won't that have the effect, won't that be a far greater deterrent to sales than this tax would be?

Mr. HART. I don't think so, as our industry has always followed a very conservative policy with respect to its installment sales, and our terms and down-payment requirements are much more restrictive than in the case of such products as household refrigerators and appliances and various consumers' goods items. We learned a month ago of the action contemplated by the Federal Reserve Board and have since tightened up our requirements still further by requiring an increased initial payment and cutting down the payment period.

Senator DANAHER. I had in mind that very argument you are offering against the tax, would apply equally to any order that would constitute a deterrent to installment sales.

Senator JOHNSON. Isn't it a fact that you are glad to have an opportunity to get away from so much credit?

Mr. HART. Yes; we believe there is a danger of inflation.

Senator DANAHER. Thank you.

II. *Will encourage waste and spoilage.*—The use of refrigerators that are no longer in condition to maintain proper temperatures to safeguard the contents results in rendering a portion of the perishable foods stored in them unsalable. This spoiled food must be thrown out. There is no substitute for food. At a time when the cry is already being raised, as it was in 1917, the "Food will win this war," we feel that the committee cannot conscientiously subscribe to any measure that will actually encourage inefficient methods in conserving the Nation's food supply.

The amount of revenue to be derived from the proposed tax on commercial refrigerators, as we shall presently show, is insignificant when compared with the probable waste in a commodity that is fully as important as tanks, planes, or cannon in successfully concluding our national emergency.

III. *Tax is inequitable.*—As it is proposed to tax refrigeration components, such as compressors, condensers, controls, and so forth, in a great many instances the amount of the tax will be pyramided. Under the old law, under which only household refrigerators were taxed, a credit was allowed for taxable components. While the intent of this portion of the measure is not clear, it is assumed that, unless this contingency is expressly provided for, a tax will be collected from manufacturers of such components as well as from the manufacturer of the complete assembly. Despite the present provision in the Internal Revenue Code designed to prevent this pyramiding effect, the manufacturer of components that would otherwise be taxable cannot always tell whether his products are going into the fabrication of a completely assembled product which is taxable, as many smaller manufacturers in our line of business depend on local dealers and jobbers for their supplies of such parts or components.

In the case of a commercial refrigerator, compressors and other parts of the mechanical refrigeration system are purchased from establishments specializing in such equipment, simply added to the cabinet or case. Thus, if these taxes are to apply separately to the finished product as well as to some of the components thereof, the manufacturers of the completely assembled refrigerator will have paid not one, but an accumulation of such taxes. The result will be a greater impact on food costs than would be the case were a single comprehensive tax to be imposed.

Perishable food must be maintained under refrigeration from its point of origin to its delivery to the retail consumer. Under the present provisions of this bill, every state of this process is affected.

The next paragraph is a very vital point.

IV. *A commercial refrigerator is not a luxury item.*—Other provisions of the excise-tax features of the bill lead us to believe that the framers of the bill intended to tax so-called luxury, or nonessential products. For example, a tax is imposed on sporting goods, phonographs, automobiles, and electrical appliances. By no stretch of the imagination do we feel that commercial refrigerators as distinguished from domestic refrigerators, should be so classified. As we have previously pointed out, adequate refrigeration is essential in all stages in the distribution of all forms of perishable foods.

When the excise-tax schedule was originally drawn, we are under the impression that a large portion of the revenue now expected from the taxes on refrigeration was to have been met by a tax on candy and confections. However, the proposed tax on candy was stricken out on the ground, we are told, that candy is a food. If candy is considered an essential food, then commercial refrigerators deserve similar consideration, for the candy industry makes liberal use of the benefits of refrigeration, and is a good customer for this industry's products. If it is inadvisable to place a tax directly on any kind of food, it is equally illogical to impose a whole series of such taxes on a class of commodities essential to the distribution and preservation of food.

V. *We also feel that the proposal is discriminatory.*—In the present schedule no mention is made of ice refrigeration; in fact, the tax is specifically limited to mechanical refrigeration. To the extent, therefore, that a refrigerator using ice as the cooling medium is not taxed, while the identical piece of equipment using a mechanical cooling means is taxed, this feature of the bill is discriminatory.

Another possible discriminatory factor is the failure of the bill to specifically name several types of refrigeration equipment, such as refrigerated locker systems, of which there are many thousands now in use. Presumably, the mechanical refrigeration cooling agency is taxable as such, but the complete locker plant is not, according to a strict interpretation of the language of the bill.

Senator VANDENBERG. On this question of discrimination and all the related subjects, what would you say of cleaning up the whole problem by eliminating the specific excises and substituting a general manufacturers' sales tax?

Mr. HART. I would sort of like that because, Senator Vandenberg, we are placing a burden on the small retail merchant.

In other words, if we take this small retail merchant 10 years ago—your neighborhood merchant, and if he is still in business today, and you analyze his business, you will find a 10-percent tax would be a tremendous burden on him.

Conclusion.—In conclusion, we wish to briefly restate some of the reasons why we believe this committee may consistently recommend the elimination of the 10-percent excise tax on commercial refrigerators—

1. Refrigerators of this type are essential for the proper preservation of food, as a protection against waste and spoilage and for the maintenance of proper health and sanitation standards.

2. The proposed tax will produce a total annual revenue from this one source of only about 1½ million dollars, a very small fraction of the savings in our food resources that the imposition of the tax would prevent.

3. The proposed tax will prove a burden on more than three-quarters of a million small business establishments throughout the country, by increasing the cost of the one piece of capital equipment they cannot do without.

4. A tax on commercial refrigerators is a tax on food—the Nation's first line of defense in the present emergency.

5. The tax will be borne by the great mass of low-income groups within our population—those least able to afford it.

6. We repeat a statement that is heard time and again from the lips of those concerned with guiding our Nation safely through the present emergency: "Food will win the war and make the peace. This life line must not be broken."

STATISTICAL EXHIBITS

I. *Comparison of commercial-refrigerator production with that of other refrigeration equipment subject to proposed tax*

	Units	Value	Estimated revenue
Household refrigerators	2,720,000	$118,880,000	$25,000,000
Water coolers	43,000	4,000,000	300,000
Ice cream cabinets	61,000	11,000,000	800,000
Beverage coolers	61,000	7,351,000	600,000
Milk coolers	10,000	818,000	70,000
Compressors	258,000	165,000,000	9,500,000
Air conditioning		25,000,000	2,500,000
Controls, coils, etc		10,000,000	700,000
Commercial refrigerators	45,000	18,500,000	1,500,000
Total		661,449,000	40,970,000

II. *Where commercial refrigerators are used*

Independent food stores	386,000
Chain food stores	40,000
Bakeries, fruit and vegetable markets, meat markets, dairy stores, etc	110,000
Restaurants and hotels	165,000
Hospitals and institutions	12,000
Total	713,000

III. *Commercial refrigerators are of three principal types*

	Purpose used
Refrigerated case (made in lengths to 16 feet.)	Storage and display of meats, sea foods, dairy products, fruits and vegetables, etc., in retail grocery stores and meat markets.
Sectional cooler (range in size up to several thousand cubic feet; are equipped with doors and windows, meat rails and hooks).	Bulk storage of all types of perishable food; used wherever food is stored in large quantities.
"Reach in" refrigerators (up to several hundred cubic feet).	Bulk storage of all perishable foods, in stores, eating establishments, etc. Special types of hospitals and institutions.

Now, in the back of your brief you will find some figures, giving you the comparative tax that would be raised in our industry as compared with other groups, and you will also find in your brief a descriptive folder of what I am talking about.

Commercial refrigerators—the case and the cooler you see in the small grocery store around the corner and around on "Main Street" here in Washington—is what I have been talking about.

If there are any questions, the secretary of the association, Mr. Sullivan, is here and will be glad to answer them.

Senator DANAHER. Can you tell me the comparative number of units of the noncommercial type produced in this country, as related to the household refrigerators?

Mr. SULLIVAN. According to published figures, the total output of household refrigerators in 1940 was 2,720,000 units.

Senator DANAHER. Can you tell us the amount of material u-ed by commercial, as compared with noncommercial, types of refrigeration?

Mr. SULLIVAN. It is a small fraction. I cannot tell exactly how much, but the small production of commercial refrigerators as compared with household and other types shows that the amount of material required by our industry is quite small. For example, our total consumption of steel last year was about 18,000 tons.

Senator DANAHER. You mean that the commercial industry hit by this bill uses only a small fraction of the material?

Mr. HART. That is substantially correct.

Senator TAFT. That is of all the refrigerators?

Mr. HART. Yes.

Senator TAFT. You are advocating then that even though we tax the household refrigerator, we exempt the commercial?

Mr. HART. That is essentially so, although it should be remembered that household refrigerators have been subject to an excise tax for some years, and this is the first time an attempt has been made to tax commercial types. In Ohio, for example, commercial refrigerators are exempt from the sales or use tax law you have in your State, on the ground that they are essential for the preservation of food, and to enable food purveyors to meet health and sanitation standards. To place this burden on the small merchant today is to drive many of them out of business.

Senator DANAHER. Are you having any trouble with priorities for materials?

Mr. HART. Mr. Sullivan can tell you about that.

Mr. SULLIVAN. We face, very naturally, a very serious shortage. The OPACS is now contemplating a severely curtailed allotment.

Senator DANAHER. The reason for my question is Secretary Morgenthau testified here that these items had been very carefully selected from a list because they were competing with national-defense needs.

Mr. HART. Still our point is, our product is essential to health. You have heard it said, "Waste is defense's enemy No. 1." You have heard that time and time again. We waste enough food here to feed some of these smaller peoples in Europe.

Senator VANDENBERG. Do you agree, Mr. Sullivan, with what the witness said, namely, that he preferred a general manufacturers' sales tax?

Mr. SULLIVAN. I do, sir.

Senator VANDENBERG. Do you think that reflects the viewpoint of your membership?

Mr. SULLIVAN. I do, sir. We have a number of them here and that point has been discussed.

The CHAIRMAN. Thank you very kindly.

Mr. John E. Hughes.

Mr. Hughes, give your name to the reporter and state the capacity in which you appear.

STATEMENT OF JOHN E. HUGHES, CHICAGO, ILL., REPRESENTING THE CHICAGO BAR ASSOCIATION

Mr. HUGHES. My name is John E. Hughes. I appear to present the views of the Chicago Bar Association, which has between 6,000 and 7,000 members, on the question of taxation of income received in 1 year but earned over a period of 5 or more years.

I have my statement in writing and if I may read it I shall not detain the committee over 10 minutes at most.

The CHAIRMAN. I will be very glad if you will make it as short as possible because we have other witnesses.

Income earned over a period of years.—Section 107 of the Internal Revenue Code purports to give relief in cases where a law fee is received in 1 year but earned over 5 or more years, but the section is worded so narrowly that it rarely gives any relief at all.

As you know, one who has held stock in a corporation for over 2 years may sell it and pay a tax of only 16½ percent of the profit. Inventors, authors, prospectors, and about everyone except lawyers may incorporate and get the benefit of this, but not lawyers because corporations cannot practice law.

A lawyer might work 10 years on a large case on a largely contingent basis. During the first 9 years he might be paid a total of $600 a year to carry him along. In the tenth year if he won the case and received a fee of $100,000, under the House bill he would owe a Federal income tax of $54,168.40. He might never again in his life get so a large a fee. As indicated above the law affords a means of relief to almost everyone else. A contractor working on a contract taking years to complete may pro rate his profit over the contract's life.

The following report of the committee on Federal taxation of the Chicago Bar Association was approved by its board of managers and I have been appointed to present it to you for your consideration.

FINDINGS OF THE CHICAGO BAR ASSOCIATION COMMITTEE

Your committee finds that the law was written and as interpreted in the regulations (sec. 19.107-1) has not served the intended purpose of extending relief to individuals who have realized a substantial income in a particular year for tax purposes as a result of services rendered over a period of years. No relief is provided under the present law unless two conditions are fulfilled—

(1) The services must cover a period of 5 calendar years or more, as distinguished from 5 taxable years;

(2) Not less than 95 percent of the compensation must be paid on completion of the service.

The fact that the services have extended over 60 months is not enough if these 60 months have not coincided with the beginning and end of 5 full calen-

dar years; nor does it matter whether the taxpayer reports income on a calendar- or fiscal-year basis. If the services of a taxpayer covered 5 full fiscal years, he cannot obtain the benefits of this section unless the services also at the same time covered 5 full calendar years. Your committee also finds that the phrase "for personal services rendered by an individual in his individual capacity" is susceptible of several interpretations and may in particular cases give rise to unnecessary litigation.

When the foregoing is considered along with the further requirement that not less than 95 percent of the compensation be paid upon completion of the services, it is believed that very few, if any, taxpayers would be given relief under section 107 as now worded.

In studying this question, your committee has taken into consideration the drastic increase in surtax rates under the first Revenue Act of 1940, as compared to surtax rates existing under several preceding revenue acts. Your committee has also recognized that it is the patriotic duty of every citizen to willingly assume his responsibility toward his Government at all times, but revenue laws should avoid unreasonable hardships wherever possible. Where possible taxpayers should be placed on a basis of equality.

In view of the fact that surtax rates graduate upward, a net income of $100,000 includible in 1 year would be subject to a much higher tax than if $20,000 of income was applied equally over 5 taxable years, or $33,000 over 3 taxable years. A taxpayer who has a stabilized or guaranteed income of $20,000 per year has greater economic security than a taxpayer whose income is largely contingent and frequently finds his income bulked in a particular year for tax purposes.

Therefore, for the purpose of equalizing the present tax burden and the avoidance of unreasonable hardship, your committee makes the following recommendations:

Section 107 should be amended in four ways—

(1) By striking out the words "95 per centum" and substituting therefor the words "75 per centum."

(2) Striking out the words "5 calendar years" and substituting therefor the words "36 months."

(3) Striking out the words "in his individual capacity."

(4) Inserting the words "taxable" before the fifth word from the end of the section.

Section 107 would then read as follows:

"In the case of compensation (*a*) received, for personal services rendered by an individual, or as a member of a partnership, and covering a period of 36 months or more from the beginning to the completion of such services (*b*) paid (or not less than 75 per centum of which is paid) only on completion of such services, and (*c*) required to be included in gross income of such individual for any taxable year beginning after December 31, 1938, the tax attributable to such compensation shall be the tax that would have been payable had it been received in equal portions in each of the taxable years included in such period."

Now, Senator, I have views here on other sections of the tax law.

The CHAIRMAN. Yes; I believe we undertook to deal with this question in 1939 and we had quite a struggle to do what we did for you. I agree, so far as I am concerned, that the 95 percent provision is an unjust one; 75 percent would be more nearly correct, and the 5 calendar year provision is pretty rigid, but we did have considerable opposition. The Treasury did not like it—this considerable loss of revenue; the difficulty was not so much in dealing with lawyers as dealing with other taxpayers.

Mr. HUGHES. After me a representative of the American Bar Association and the Illinois Bar Association speaks on the same point to the committee. Of course, it is a discrimination. If I am prospecting for oil or an inventor seeking a patent for my invention, I can incorporate, issue stock, hold it 2 years, then sell it and pay a tax of only 16½ percent of the profit. Even an author can do that. He can sell his work to a corporation and then sell its stock, but

a lawyer has no such relief and he is about the only individual under this law who has no such relief. It strikes a poor man hard, particularly a poor man's lawyer. A corporation lawyer does not ordinarily handle cases on a contingent basis and is, therefore, not so apt to find himself in a position where this law will work a hardship on him. Such a lawyer may work on a patent case for several years and finally collect a fee only to find that he has to pay 60 percent of it to the Federal Government, with a further probability that he will have to pay an additional State income tax.

The Chicago Bar Association authorized me to present to this committee my suggestions for the improvement of the revenue law and its administration. No action has been taken by the board of managers of the Chicago Bar Association on the following views, and I present them solely on my own responsibility.

Taxability of insurance.—At page 467 of the House hearings Mr. George M. Morris, chairman of the tax committee of the American Bar Association, suggested section 811 be amended to impose the estate tax only on insurance in which decedent at the time of his death owned any of the legal incidents of ownership.

I suggest that such an amendment would be about the equivalent of exempting almost all insurance from estate tax.

In the United States there were outstanding on December 31, 1937, 120,000,000 life-insurance policies with a face value of $110,000,000,000. Most of this is family insurance and it is a very easy thing for a husband to transfer the incidents of ownership to his wife and rely on her to give them back to him in case of need. It will be done if this exempts it from estate tax. Every insurance agent will make it a talking point. It ought to boost insurance sales to wealthy people.

The present regulation, making payment of premiums the test of taxability was adopted after long experience and from the standpoint of practical administration should be retained and perhaps even written into the statute.

Suggested amendment to statutory definition of reorganization.—During the unprecedented depression starting in 1930 hundreds of hotels, apartment houses, and industrial corporations were unable to pay the interest on their bonds and the bondholders took over the property and reorganized it in an attempt to salvage their investment.

The Treasury ruled in I. T. 2071 published C. B. 111-2 at page 34 that such a transaction was "the most common form of reorganization," notwithstanding the stockholders did not participate, and the Treasury consistently held the bondholders could deduct no loss. This Treasury ruling was affirmed by the Circuit Court of Appeals for the Seventh Circuit in the case of *Kitselman* (89 F. (2d) 458) and the Supreme Court denied certiorari in 302 U. S. 709. The Government's brief in the Supreme Court opposing the taxpayer's petition was signed by Solicitor General Stanley Reed and made an able defense of the decision below. The Board of Tax Appeals has consistently followed this ruling and that of the sixth circuit in the *Newberry Lumber Co.* case (94 F. (2d) 447).

When Congress was considering the 1934 Revenue Act a subcommittee of the Ways and Means Committee proposed to eliminate the reorganization provisions from the law, but both the report of the Senate Finance and of the Ways and Means Committees stated these

provisions should be retained and—to quote the Finance Committee—"Furthermore, the retention of the other reorganization provisions will prevent large losses from being established by bondholders."

Now, after the statute of limitations bars the right of bondholders to deduct losses, the Treasury is claiming in the Supreme Court in the *Marlborough House case* that the foregoing Treasury ruling and circuit court of appeals decisions, upholding its own vigorous contentions, were wrong and that bondholders should have deducted their losses in the year of reorganization and must now pay a tax on the difference between the figure to which they should have then written down their investments, but did not and could not do so, and what they now get, albeit such sum is less than the original cash cost of their bonds.

The Board of Tax Appeals and the circuit courts of appeal for the second, fifth, sixth, eighth, and tenth circuits have decided against this grossly inequitable Treasury contention, but the circuit court of appeals for the tenth circuit has upheld and it is now pending in the Supreme Court.

This matter was discussed at pages 479 to 486 of the House hearings on behalf of the superintendent of insurance of the State of Ohio.

If the Supreme Court upholds the Government, its decision ought, in all justice, to be speedily reversed by legislation, and taxpayers ought not to be subjected to the hazards of what the Supreme Court may do. There is abundant precedent for reversing unwise or impractical Supreme Court tax decisions by ordinary legislation. A few of the tax cases thus reversed are *United States* v. *Hendler* (303 U. S. 564), by section 112 (k) of the code; *United States* v. *Michel* (282 U. S. 656), by section 3772 (2); *United States* v. *Swift & Co.* (282 U. S. 468), by section 3770 (3). While the decision of the Court of Claims in the case of Toxaway Mills (61 Ct. Cls. 363) was pending in the Supreme Court, the Senate decided taxpayers ought not to be subject to the hazards of an adverse decision and reversed it by section 3770 (a) (2). (See Congressional Record, vol. 67, pt. IV, p. 3531.) Also the decision of the Tax Board that the installment sales regulations were illegal was reversed, pending court decision, by the 1926 act.

The proposed amendment is as follows (the changes from existing law being printed in italic):

Proposed amendment to reorganization definition.—Section 112 (g) (1) of the Internal Revenue Code is hereby amended to read as follows:

(1) The term "reorganization" means (A) a statutory merger or consolidation, or (B) the acquisition by one corporation in exchange solely for all or part of its voting stock: of at least 80 per centum of the voting stock and at least 80 per centum of the total number of shares of all other classes of stock of another corporation; or of substantially all of the properties of another corporation, *including the acquisition through foreclosure, judicial sale, or receiver's sale, if after such acquisition an interest or control of 50 per centum or more in the assets transferred remains in the bondholders or stockholders of the prior corporation,* or (C) a transfer by a corporation of all or part of its assets of another corporation if immediately after the transfer the transferor or its shareholders or both are in control of the corporation to which the assets are transferred, or (D) a recapitalization, or (E) a mere change in identity, form, or place of organization, however effected. *The amendment made by this section shall be retroactive to January 1, 1930. Provided, however, that if a transaction amounted to a reorganization under the law existing at the time of its consummation it shall constitute a reorganization for purposes of this amendment.*

A special court of tax appeals.—It is suggested that your committee give consideration to the creation of a special court of tax appeals,

composed of tax specialists of at least 15 years' experience to have exclusive jurisdiction of appeals in all civil Federal tax cases and the decision of which is to be final except on constitutional questions, with respect to which review may be had in the Supreme Court by certiorari.

The Federal tax laws are extremely complicated and are becoming increasingly so. Furthermore, many of the problems presented are vitally involved with the Nation's commercial life. To properly understand and apply these laws so as to avoid inconsistencies and absurd results requires a background of years of extensive experience and a clear conception that most principles of tax law cut both ways. The members of the circuit courts of appeal do not have or profess to have this specialized experience, with the result that the decisions are conflicting and inconsistent on all important tax questions, and according to some of our leading law-school reviews some of them approach the borders of absurdity.

Further, the dockets of some circuits are far behind. For example, a tax appeal docketed in the sixth circuit court of appeals April 3, 1940, could not be heard before April 15, 1941, or over 1 year after it was docketed, despite efforts of counsel to push it to prompt hearings. Also the circuit judges frequently hold tax cases under advisement for weeks after they have been argued and submitted. Failure of our judicial personnel to keep pace in ability with the increasing complexities of life, and persistency in applying horse-and-buggy-age procedure in the decision of cases in an airplane age have been the main reasons for the debacle in judicial prestige during the past decade.

In addition, about one-fourth of the time of the Supreme Court is taken up considering Federal tax cases involving solely technical points of taxation. In the overwhelming majority of those in which the courts of appeals have differed from the Board of Tax Appeals the Supreme Court has sustained the Board, thus indicating the superiority of the judgment of an expert, specialist, administrative personal over that of a circuit court of appeals too often composed of lame ducks and country judges to whom tax law is as strange as patent law. With the exception of the very able personnel of the second circuit court of appeals and a few other scattered judges it may be said the judiciary is neither adequately experienced nor mentally equipped to cope with extremely complicated and technical tax problems. By this I do not intend to imply that all the circuit judges are not above the average of ability at the bar. What I mean to express can be conveyed by saying that if I or most members of Congress should be put on the bench of the circuit court of appeals tomorrow and the first case given us for decision was an extremely complicated and very involved technical patent case we would not be nearly so well equipped to decide it as a patent specialist with a background of 20 years intensive experience. So it is with tax cases. Certainly the people are entitled to the greatest competency in those deciding these questions.

A tax appellate court, composed of eminent tax specialists of similar caliber and national reputation to Randolph E. Paul and Robert H. Montgomery or of several of the present members of the Board of Tax Appeals or Court of Claims or of three circuit judges one could select, could comprehend the issue involved immediately and decide most of the appeals at the conclusion of the argument as the

English Courts of Appeal do and always have done. Continued specialization would increase the ability to do this. Over 50 percent of appeals involve no new principle and should be decided per curiam without a long-winded opinion, issued weeks after the argument. Candidly the reason the English courts are able to and do decide cases at the conclusion of the argument and ours are not is due primarily to a difference in the experience and mental ability of the judges. Men appointed to the bench should be of sufficient mental caliber that they do not need to hold cases under advisement for weeks and sometime months. If they were the equals in ability of English judges our decisions would also be delivered at the conclusion of the argument as they are in England. The English judges are paid about $25,000 a year, which buys more over there than it does here, and you are not going to get men of equal ability here to serve on such a proposed court for less than that. Salaries of $12,000 a year will, with some notable exceptions, get you lame ducks, country judges, and petty politicians, jacks of all trades and masters of none, experienced in personal inquiry suits and petty cases, and who never earned and never will or could earn $12,000 a year at the bar. The great difference in the respect for the courts here and in England is due to the difference in the mental caliber of their personnel. This special court might be given power to make rules for the Board of Tax Appeals so that it could expedite the decision of cases there.

This court of tax appeals could hold hearings throughout the country in the principal cities where the circuit courts of appeal now sit and by hearing only tax cases, making prompt decisions, and eliminating the long-winded opinions which now constitute the decision of almost every appeal, it would soon bring tax appeals current and hundreds of millions of uncollected revenue would not be tied up in pending cases, which drag on for years, often until the tax becomes uncollectible, as in the case under the existing procedure. Inquiry will disclose that hundreds of millions in revenue are tied up in pending tax appeals, the prompt settlement of which would greatly augment the revenue.

The committee on Federal taxation of the Chicago Bar Association voted in favor of this proposal for a special court of tax appeals.

Discrimination in favor of residents of community-property States should be abolished.—Under the House bill a married man with no dependents living in California or one of the other seven community-property States having an income of $100,000 from personal services pays a tax of $20,002.40 on half of it and the other half is reported in his wife's return and $20,002.40 paid on that. If this man had lived in any one of the other 40 States he would pay a tax of $53,310.40. It is indefensible that the accident of residence in one of the eight community-property States should result in $13,305.60 less tax on an income of $100,000. Where the income is higher the tax saving is proportionately greater. The President in his message of June 1, 1937, suggested this be corrected. The income tax on income from personal services is an excise and the Constitution bluntly says excises must be uniform throughout the United States. You cannot convince the ordinary citizen they are uniform when they operate that way. Members of Congress from the other 40 States ought to wake up to this

discrimination and eliminate it. One way you can get millions more in revenue is simply by putting all United States citizens on an equal basis.

Thank you, sir.

The CHAIRMAN. Thomas Owens.

STATEMENT OF THOMAS OWENS, CHICAGO, ILL., ON BEHALF OF THE CHICAGO BAR ASSOCIATION

Mr. OWENS. My name is Thomas L. Owens. I am here on behalf of the Chicago Bar Association. The American and Illinois State Bar Associations are in accord with the recommendations of the Chicago bar. I have brought with me a number of the Chicago Bar Association records for the month of June 1941 which I have turned over to the clerk for the use of the committee. The recommendation of the bar is included in the record.

Last month I was in Washington and took the matter up with the Treasury Department and with Mr. Stam. I feel that there are a few things which I can mention which are different from the points covered by Mr. Hughes.

I notice what was said about the 95 percent being changed to 75 percent, but I wish to say that the change in the number of years might be an even more important feature because the vast majority of lawyers do not deal with fees of $100,000 or $50,000 but rather with much smaller fees. Generally their work upon estates and on matters involving real and personal property taxes, refunds on public-utility matters, representative suits against bank stockholders, suits on behalf of minority stockholders, and so forth, occupies a period of 3 to 4 years during which time they barely make a subsistence or perhaps $3,000 to $5,000 at the most. Then in the third or fourth year they receive a fee of $20,000 to $25,000, whereupon they must pay two or three times as much tax under the law as if they had received the same fee in proportionate amounts in the years they worked for it. Under the present change in the tax rate the increase will be much larger.

The Treasury Department suggested changing the present section 107 by using the word "taxable" in front of the word "years" instead of the use of the word "calendar" as is now shown in the act. In other words, they advocated stating in the act "5 taxable years" instead of changing it to "36 months" or "3 calendar years." Mr. Stam suggested merely changing the word "five" to "three." At the present time, in order to come within the purview of the law it is necessary that a person actually work for 6 or 7 taxable years. I would say that 999 lawyers out of 1,000 would not be helped by the present provision. The reason the bar is suggesting 36 months is to bring the time within the fiscal instead of the calendar years. I believe one of the changes should be placed in the act. If you cannot see your way clear to make it 36 months then the word "five" ought to be changed to "three" or the word "calendar" should be changed to "taxable."

Some statements have been made to the effect that administrative changes are not going to be made until the next session. I realize the committee has worked very hard in completing the present bill and would not relish trying to fit the changes into it at the present

time. If it appears necessary to wait until the next session to make the change, may I suggest that it at least be made retroactive?

I wish to thank you very much for the privilege of appearing before the committee.

The CHAIRMAN. Thank you, sir.

Mr. MacDonald.

STATEMENT OF J. A. MacDONALD, NEW YORK, N. Y., REPRESENTING THE CONTROLLED COMPANIES OF THE AMERICAN DISTRICT TELEGRAPH CO. AND SUBSCRIBERS

Mr. MACDONALD. My name is J. A. MacDonald. I am here on behalf of the controlled companies of the American District Telegraph Co. and the 30,000 subscribers to their central station fire, sabotage, and burglary prevention services in 39 States of the Union. I also represent, in order to conserve the time of the committee, the Holmes Electric Protective Co. of New York and Philadelphia; the Central Station Signals, Inc., of New York City.

My appearance here concerns the imposition in H. R. 5417 of a 5-percent excise tax on wire and equipment services defined to include burglar alarm and all other similar services. We believe that this provision is broad enough in definition to include not only burglar-alarm service, including the best-known forms of sabotage detection, but also all types of fire protection. I have here some reasons why we believe the tax should not be imposed:

1. The companies supplying such services are not telephone, telegraph, or communications companies, are not engaged in interstate commerce, and are not vested with a public interest.

2. Wires used by companies supplying such services are leased from telephone and other wire-using companies, and the use of wires is an incidental part of the comprehensive services supplied. No messages are sent over these wires but fixed, unvariable signals, automatically transmitted by mechanical means to central-station attendants to indicate disturbances of the protection arrangements within protected premises. These signals would have no use or value, except for the subsequent action taken by central-station attendants in investigating their causes and dispatching investigators, guards, maintenance men, or the municipal fire or police departments, as required.

3. The services are not essential to the conduct of business as are electric, gas, water, transportation, or communication services supplied by public utilities. A concern can do without any special protection, or it may rely entirely upon insurance or upon watchmen or upon an alarm which merely rings a bell within or on the outside of the premises, all as substitutes for central-station protection, under continuous electrical and manual supervision and maintenance, which dispatches its own armed guards and summons the municipal fire and police forces when needed.

4. The services supplement municipal fire and police protection, providing special protection to concentrated values and against special hazards. The total paid by subscribers to such services amounts to a tax already self-imposed to supplement the protection afforded by the municipality to general taxpayers.

5. The effectiveness of the services in safeguarding lives and property is attested by their proven record in minimizing fire and burglary losses and in capturing burglars and by the substantial recognition of such agencies as the National Fire Protection Association, National Board of Fire Underwriters, International Association of Fire and Police Chiefs, Safety Councils, Fire Marshals, and all fire and burglary prevention authorities as well as the 30,000 prominent concerns who employ and pay for such services.

6. By adding to the cost of the services the proposed tax very definitely would discourage their retention and growth and encourage reliance upon inferior, ineffective substitute protection measures or none at all. The fact that there are only 30,000 subscribers to central station services—a small fraction of the number of prospective users—is eloquent proof that cost definitely limits the extent of their use despite their far-reaching and immeasurable value.

7. The value of properties protected, excluding banks, exceeds $21,000,000,000. It is obvious that one single and comparatively small loss through a single fire, act of sabotage, or burglary where central station might have been employed and prevented the occurrence but for this proposed tax, could destroy far more in property value, alone, than the total revenue contemplated by the proposed tax. Plants can be rebuilt in time, but sacrificed lives cannot be restored nor can lost hours of production be regained. The far-reaching effects of interrupting business, production, and employment in a single plant upon the production of other plants and the whole program for safeguarding the national safety and health is quite obvious.

8. The Federal Government, through its military and naval commands, Federal Bureau of Investigation, Office of Civilian Defense, and other agencies, is sparing no effort to have all plants which are vital to national defense and to national health and safety made as safe as possible against destruction or interruption through fire, sabotage, and kindred hazards. Other agencies are working with the problem of procuring more buildings, machines, and materials to produce armaments. It would be most unfortunate and inconsistent to discourage the retention and growth of this invaluable protection at this time when there is such stern necessity to expand and speed up production and to surround it with every reasonable safeguard against unnecessary interruption from any cause, among which fire and sabotage are greater than ever and constantly increasing.

9. It is estimated that the proposed tax would yield a gross return of about $750,000 but that would be reduced more than a third by reason of the consequently reduced tax payments of the concerns who pay it; and it might very well result in a final net loss of revenue to the Government—because a plant that has burned doesn't make profits or pay taxes, the taxable incomes of its employees cease and they may add to unemployment and relief rolls, the incomes of those whom the concern and its employees patronize are reduced, and if an insurance company pays the loss, its taxable income in turn is reduced. The possibility of increased revenue in reasonable prospect seems a puny justification for such a great gamble.

10. It is respectfully requested that the words "burglar-alarm service" be deleted from the bill, and that the following sentence be

added: "Nothing herein shall be construed as imposing this excise tax upon amounts paid for central station fire or buglar protection services."

Senator TAFT. How many subscribers are there to the other services?

Mr. MACDONALD. The controlled companies have about 30,000 subscribers. I should say in the aggregate all other suppliers of central-station service do not serve in excess of 15,000.

Senator GUFFEY. What is the average cost to these 30,000 subscribers?

Mr. MACDONALD. It depends entirely on the extent of protection provided.

Senator GUFFEY. Well, there must be some average.

Mr. MACDONALD. Yes; I should say $300 or $350 a year.

Senator TAFT. This would therefore increase the charge by from $14 to $17.50 per subscriber?

Mr. MACDONALD. The use of averages is always misleading, the amount runs from sums such as you mention to sums in excess of $1,000 per subscriber.

The CHAIRMAN. You do not own the wire, you simply lease the use of the wire?

Mr. MACDONALD. Yes; the services are supplied almost entirely over leased wires.

The CHAIRMAN. You are not therefore directly competing with any defense or emergency production project for strategic materials?

Mr. MACDONALD. We do employ some very small quantities of material within the properties protected and in that respect the Government has recognized the importance of the services we supply in protecting plants engaged in defense rearmament work, and the need which we have for certain materials. Right now we are furnishing service to Glenn Martin, North American, United Aircraft, Curtiss-Wright, Lockheed, and a number of other aircraft manufacturers; we are protecting shipyards as well as many other concerns engaged in rearmament, including General Motors, Chrysler, Ford, Hercules Powder, American Cyanamid & Chemical, to name but a few. The Office of Production Management has recognized the importance of this service and they have given us great assistance in procuring such small amounts of material required by us in order to give this service. We feel it would be a grave mistake to attempt to tax this service at this time.

The CHAIRMAN. All right; if there are no further questions, we thank you.

Mr. MACDONALD. Thank you, sir.

The CHAIRMAN. Mr. Dorrance.

STATEMENT OF CHARLES DORRANCE, CINCINNATI, OHIO, PRESIDENT, WEST VIRGINIA COAL & COKE CORPORATION

The CHAIRMAN. Will you give your name to the reporter, please?

Mr. DORRANCE. My name is Charles Dorrance. I am president of the West Virginia Coal & Coke Corporation, a company incorporated under the laws of West Virginia and engaged in the production and sale of bituminous coal. This petitioner has been engaged in such business since 1929 as successor to a company of the same name which

went through bankruptcy proceedings during the years 1927 to 1929. In 1941 we will produce in excess of 3,000,000 tons of bituminous coal.

This petitioner wishes to show the unfairness and discrimination to itself and to a major portion of the bituminous-coal industry which would result from that proposed provision for excess profits, "Special rule in certain cases where invested capital is used," title II, Excess Profits Tax Act, section 201, amending 710 (a) of the Internal Revenue Code.

The Ways and Means Committee of the House has recommended this special rule because—

> Many corporations which are making added profits directly or indirectly attributable to governmental expenditures for national defense are paying no additional taxes upon such profits. It is felt that such corporations benefiting so substantially from defense expenditures should make a larger contribution from their increased income, even though their income for the taxable year is still less than their invested-capital credit.

The petitioner recognizes the urgent need for revenue by the Federal Government and is glad to support any tax measure that would be just and which would not discriminate as between individuals, corporations, or industries. As far as this petitioner and the major portion of the bituminous-coal industry are concerned, the specific reason given for this special rule by the Committee on Ways and Means does not apply. The ability of this petitioner to earn a reasonable profit is not attributable directly or indirectly to governmental expenditures for national defense, but its ability to do so is directly due to the establishment of minimum coal prices on October 1, 1940, under the Coal Act of 1937. The total earnings of the petitioner may be affected by governmental expenditures for national defense, but only to the extent that they are not a reasonable return. In this case earnings would quite rightly be subject to the regular excess-profits tax provisions of the act.

In the 10 years since 1929 up to and including September 30, 1940, the petitioner has shown a net loss from its operations in the amount of $1,427,000. In only 2 years, namely, 1934 and 1935, under the National Recovery Administration, has the petitioner shown a profit. On October 1, 1940, the minimum prices under the Coal Act of 1937 (Guffey bill) finally were made effective, and as a consequence thereof the last quarter of 1940 showed a net profit for the petitioner of $172,000. It is important to point out that in those periods in which the company showed a profit its main business, namely, the production and sale of bituminous coal, has been regulated by a Government agency, and further, that in all these three periods of profit the operations of the petitioner were not benefited by any unusual governmental expenditures.

To show that the ability to earn a reasonable profit by the petitioner is not dependent on increased purchases demanded by national defense, a comparison is hereby given of the tonnage and earnings made in the last quarter of 1939 and the last quarter of 1940:

> Last quarter of 1939, tonnage 794,000; income $87,000.
> Last quarter of 1940, tonnage 642,000; income $172,000.

It will be noted from the above tabulation that with a 24-percent decrease in tonnage, fixed minimum prices effective on October 1, 1940,

caused a comparative increase in income of 98 percent. Also please note that in neither of the above periods did governmental expenditures for defense have any bearing directly or indirectly on the results of the petitioner's business.

In the first 6 months—October 1940-March 1941—when the industry was under regulation and minimum prices were in effect under the Bituminous Coal Act, the petitioner's coal sales realization averaged $1.92 per ton. In the similar period—October 1939-March 1940—when prices of coal in the industry were not regulated by the Government, the average sales realization of the petitioner was $1.65 per ton. This increase of 27 cents per ton in sales realization through governmental regulation is clearly the predominating factor in producing a profitable operation as compared with the losses in the past.

To emphasize further that stabilized Government prices, and not national-defense expenditures, are the reason for the bituminous coal industry, and for this petitioner, showing reasonable profits at the present time, we wish to give herewith a statement showing that the petitioner during the base period for excess-profit credit, namely, from 1936 to 1939, inclusive, would have shown, with Government-regulated prices, a profit of $1,494,000 instead of a loss of $1,114,000.

	Actual net losses	Tons coal sold	Average realization per ton	Estimated additional revenue based on code prices (average, $1.92 per ton)	Adjusted income (profit) had sales been made at code prices
1936	$80,000	2,544,000	[1] $1.64	$712,000	$632,000
1937	344,000	2,369,000	1.71	498,000	154,000
1938	530,000	1,772,000	1.60	567,000	37,000
1939	160,000	2,443,000	1.58	831,000	671,000
Total	1,114,000	9,128,000	1.64	2,608,000	1,494,000
Deduct actual losses from estimated additional revenue				1,114,000	
Estimated earnings based on average code price of $1.92				1,494,000	1,494,000

[1] Adjusted upward 10 cents per ton to take care of wage increase in 1937.

The petitioner, like other members of the bituminous-coal industry during the above base period from 1936 to 1939, was the victim of what the Supreme Court called a free competition degraded into anarchy. The industry and its members were freed from this condition only by minimum prices made effective October 1, 1940, by the Coal Division of the Department of the Interior.

As the stated reason given by the Ways and Means Committee justifying this special rule is clearly shown not to be true in the case of the bituminous-coal industry, its adoption would discriminate against the petitioner and against a large percentage of the bituminous-coal industry.

It is not the aim of the petitioner to oppose tax measures which fairly distribute the burden of defense among the individuals and corporations of this country. We do feel that the facts which we have given show clearly that the adoption of such a special rule would be unfair

and discriminatory to the great bituminous-coal industry. We feel it would be a mistake to impose such discrimination upon a vital industry whose background of poverty and the reasons therefor are so well known.

The CHAIRMAN. Mr. Dorrance, you say that a large percentage of your industry finds itself pretty much in your position.

Mr. DORRANCE. Yes; I understand that the executive secretary of the National Coal Association is to appear here later on, and also some other members of the industry.

The CHAIRMAN. The nature of your industry, of course, requires you, and your past history requires you, to take the invested-capital rule.

Mr. DORRANCE. Yes; but this rule put in the bill by the Ways and Means Committee says that if we do that, if we elect to take the invested-capital credit and have no earnings, as we have—the petition has no such earnings—and suppose we made $500,000, we would then have to pay 10 percent on it.

The CHAIRMAN. Although you don't earn as much as you are entitled to earn under the invested-capital credit, nevertheless, as long as you are making more than you formerly did, they would think it right to impose this 10 percent on your.

Mr. DORRANCE. Now, I am not speaking for the stockholders of the particular company I represent, although I may say that such stockholders should be entitled to some consideration, having invested $10,000,000 in the purchase of its securities, bonds, and stocks, but I am thinking of the vital industry, and I know of no more vital industry to the defense program than ours, which has been starved for 10, 15 years; and I can give you, I think, as good a concrete example of what I want to do with the large amount of the money I make as you would want. Our entire properties are dependent on one powerhouse. We are now running two boilers that run the turbines that make the electricity for our mining at 300 to 400 percent rating. They have never been properly overhauled or renewed because of the fact that we cannot shut them down. We cannot supply power to our mines unless we have these boilers going. I have wanted to put in an extra spare boiler that would allow for that for all of the years that I have been with them, and my predecessors have done the same, and we have never had the money to do it. We have got innumerable calls on our money in order to keep the flow of bituminous coal flowing in the quantities necessary for this defense movement.

The CHAIRMAN. Well, I understand the reasoning of the Ways and Means Committee and Treasury Department, but it is a very difficult tax to justify at all, because you haven't made any extra profit, and that is the answer to it. Your tax has gone up 24 to 30 percent on your normal. You are paying for that a considerable percentage over in increased rates on the normal, and you haven't reached your credit base because you have done a little better, which you attribute to other reasons than defense, which probably has great force, but in any industry it is hard for me to reconcile this thing because you haven't earned your credit and that seems to me to be the answer and an answer I cannot argue around. You simply haven't any excess profit until you reach the amount where your excess profits begin.

Any other questions?

(No response.)

The CHAIRMAN. Thank you, Mr. Dorrance.
Mr. DORRANCE. Thank you.
The CHAIRMAN. Mr. Flanagan.

STATEMENT OF WALTER J. FLANAGAN, BROOKLYN, N. Y.

The CHAIRMAN. Will you give your name to the reporter and state for whom you appear if you are representing anyone other than yourself?

Mr. FLANAGAN. No; I do not.

My name is Walter J. Flanagan. I am a natural-born citizen, resident, and elector of the State of New York. I tried to appear before the House Ways and Means Committee, but was too late, and made application immediately to appear here. What I wished to say then didn't come up before the House Ways and Means Committee; therefore I appreciate this opportunity to do so now.

My views are mine alone, yet I think the committee is honoring itself because there are many millions just like me, who have children, more to give than dollars.

We know the President was authorized by law, and justified by the wars raging, to declare an unlimited national emergency, asking all to pledge, if need be, "our lives, our fortunes, and our sacred honor." That the national-defense program is imperative; that its planned cost has already reached $50,000,000,000; that taxes must be levied at the highest rates yet invoked; that this bill now before the committee is the first major step to achieve that purpose—an act to provide revenue, and for other purposes. I am not concerned with the revenue item; my interest is in "the other purposes."

Now, all the experts, both of our own departments and foreign experts, and of the Nation, have spoken for what I may summarize as the disciplines that govern them. I will make that clear as I go on. The work cannot be reviewed, yet I disagree, and that disagreement is general and specific.

Before, during, and after the last World War you made tax laws of this same type and character containing the same identical pattern of disciplines, and what was the result in the light of the experience now? You cannot be untruthful about it. It is real, cold, and hard facts, and this is it: The people of the United States were not protected as they should have been. This is evidenced by the fact that they have been paying for 25 years, interest on $13,000,000,000 of debts of nations that govern half the world's population and rule over half the earth's territory. The gold content of the dollar was then reduced to 59.6 cents.

Now, if you retrace your steps and follow the same identical pattern of disciplines, what is going to happen? You are apprehensive of it yourselves. I don't have to sit in judgment on you because you have passed the law renewing the President's right to lower the gold content of the dollar in any way he chooses. These are the facts that you have to consider.

This conquest will be evidenced by legalized money demands against the people, against their homes, their farms, and factories, all their enterprises, all the physical properties in excess of 100 percent of their possessions. They will not be debts due themselves, except in a minor

degree; they will be due the tax-free wealth holders of the world.

Taxes are levied to protect a free people; they gladly pay taxes with that characteristic. If that characteristic is missing, or the people are not free, all taxation is an abomination.

When the disciplines of the experts clash and are in conflict with the fundamental rights of a people, when they are so great as to be measured by the scale of appropriations now being made for national defense, the disciplines must be abolished and abolished forthwith.

It is here before this committee, free America has its last chance to be vigilant against a conquest from within.

On that account the bill before you, gentlemen, is defective. What is wrong is ascertainable. It is not a mystery. It must be pointed out and identified.

The tax bill does not protect the people; it protects first, last, and always, omnipotent wealth. The President calls it omniscient wealth, without a definition. It is the tax-free wealth in all countries. It can operate anywhere on the face of the earth; it has no laws binding on it; it gives allegiance to no flag. Any nation that goes to killing on account of these disciplines is wrong. What good does it do to kill 4,000,000 Russians? To kill 4,000,000 Chinamen? Are you being asked to have 4,000,000 Americans killed to settle the ownership by tax-free wealth of the rubber, tin, oil, and quinine in the Dutch Indies? China, at the price paid, should own it all.

The American people are ready, able, and willing to give you their sons and daughters to defend America, to protect their own families and neighbors against attacks, and to uphold and defend the Nation's honor, to aid the Union oppose ruthless aggression by any nation. We give you them as free men and women, not slaves, serfs, or a captive or subjugated people. None of their fundamental constitutional rights are surrendered and you cannot ask such surrender. We do not give you them to fight an undeclared war and protect the tax-free wealth of the world; or to fight for and defend the tax-free wealth which operates to make a conquest of our country from within. We abhor their unknown commitments, because untaxed wealth in industry, regardless of the piety or wickedness of the owner, saint or sinner, is always lawless. In all ages of civilization, under every flag, untaxed wealth refuses by foul means only—and some of the disciplines or provisions of this bill are in that category—to give to Caesar the things that are Caesar's, and against every race, nationality, creed, and color fights man giving to God the things that are God's. It makes all wars; breeds all rebellions; and provokes all revolutions. It considers all governments crooked; none straight. It deems itself mightier than any government; putting kings on thrones and knocking them off.

It therefore follows that a new and higher intelligence must write the tax laws; an intelligence that is concerned in protecting the many and not safeguarding the few; an intelligence that will not allow free America to be conquered from within. Let anyone in America make a million, ten million, or a hundred million, or have that much; that's America; but under an unlimited national emergency let him pledge every dollar of that to American defense—not to make more profits but to pay like taxes as compared to others—and the only proof he has of honorably fulfilling that pledge is in paying taxes each year on every dollar he has and on every dollar of income.

It is not necessary that any people be killed. It is wrong for any nation to kill people to get rid of protected tax-free wealth. The disciplines that do the hurt can be abolished by proper legislation. The people have a right to demand it of you as their representatives. We do demand it. We want to remain a free people. We do not want to be put in bondage. We are determined to remain a free people. That's what we'll fight for, even if you plan a conquest.

The preservation of these disciplines imposes involuntary burdens, does injury to all the people. They allow the tax-free wealth of the world to alienate the mastery and control of American productive labor and industry from taxation. It is the foundation stone of ruthless aggression within the Nation. One hundred and twenty-six thousand Americans died in the last war to abolish all such disciplines and involuntary burdens. You cannot ask Americans to die twice to get rid of those disciplines.

We do not need another war to have faith in our country. None need die again for freedom. That was our heritage from the Revolutionary War. None need die again to abolish slavery here. That was our heritage from the Civil War. None need die to stop a conquest of the United States of America from within or without by ruthless aggression, swindling, and plundering. It was our heritage from the first World War. We cannot break faith with the honored dead.

Without being specific as to the other pertinent provisions in the bill, I ask that you read in conjunction with this contention the following American principles for taxation by reason of the national-defense program:

1. It is a crime of the blackest hue for the national-defense billions to create new wealth untaxed in any one year by whomsoever received—and that includes all religious, charitable, literary, scientific, and educational institutions or their convenient holding company, with a Federal or State charter.

2. It is a crime for any wealth in the United States to go untaxed in any one year—including stock bonus to officers—during this crisis, which derives an income from the production of arms, munitions, and implements of war.

3. It is a crime of a blacker hue, because treasonable in character, for American wealth wherever located and by whomsoever owned to go untaxed, which is engaged in furnishing arms, munitions, and implements of war to those nations whose policies are admittedly the cause of making this Nation expend billions for defense, *to procure* a two-ocean navy, and mobilize our youth in the millions for 30 or more months for training in war.

I therefore petition you to strike out subdivision 14 of section 101, Internal Revenue Code, 1940, reading as follows:

> Corporations exempt from taxation:
> 14. Corporations organized for the exclusive purpose of holding title to property, collecting income therefrom, and turning over the entire amount thereof, less expenses, to an organization which itself is exempt from the taxes imposed by this chapter—

having special reference to subdivision 6 of section 101 in conjunction therewith, reading in part:

Corporations exempt: Religious, charitable, scientific, literary, or educational purpose. No part of net earnings which inures to the benefit of any private shareholder or individual, and no substantial part of the activities of which is carrying on propaganda or otherwise attempting to influence legislation.

4. It is a crime for any wealth to exist in the United States or income to be derived therefrom tax-free by any foreigners or alien corporations or institutions, used in industry or in competition, lawfully or lawlessly—treaties to the contrary notwithstanding.

As to that specification, I refer to section 107, reading:

No amendment made by this title shall apply in any case where its application would be contrary to any treaty obligation of the United States—

calling attention to the fact that all treaties are within the jurisdiction of the Senate and that all provisions of such treaties sustaining disciplines abolished by the death of Americans in the last World War should be outlawed; also, in that connection, it should be borne in mind what is being done under the lease-lend bill—what the R. F. C. and its corporations are doing for countries of the Western Hemisphere. These are burdens that fall on the taxpayers.

We protest against the issuance of watered stock against the taxpayers' dollars. Let me illustrate:

The Government wants a million-dollar defense item. It has selected the "free enterprise" to undertake the job. The "free enterprise," perfectly competent, hasn't the necessary capital. The Government loans an adequate sum, say, a million dollars for round figures. It can be more or less. It then permits the borrower to amortize that debt over 5 years. With prospects of other orders, the borrower decides to capitalize his venture, or increase his capital if a going concern, by the issuance of more stock, to which the public subscribes. This is the situation: The Government is operating on a deficit; it hasn't the money to buy the $1,000,000 item; it hasn't the $1,000,000 to loan the borrower. What happens? For a single service costing $1,000,000 the Government has permitted legalized money demands to be thrown out against the productive toil and industry of America—an indebtedness of the Government bearing interest for $1,000,000—an indebtedness perhaps made by the R. F. C. of $1,000,000, also bearing interest—an indebtedness of $1,000,000 for a "free enterprise" entitled to earn 8-percent claims against the American people; a total of $3,000,000 for a single $1,000,000 service.

That is not all. I am referring now to the disciplines in your tax bill. Under the amortization the borrower does not repay $1,000,000 cash. He pays part of it every year, and on the fractional part paid the first year the Government must earn interest at the same rate it charges the borrower for 4 years; on the second installment, interest for 3 years; the third installment, interest for 2 years; and for the fourth installment, interest for 1 year; so that with the fifth installment the Government has 100 percent of the debt to liquidate the loan wherever it was obtained. This is the rub: As each installment is paid, the Government spends it; and the interest is never earned—4, 3, 2, and 1 years' interest—now multiply that in the billions and tell the people these disciplines are justified.

Abraham Lincoln said:

But it has so happened, in all ages of the world, that some have labored and others have without labor enjoyed a large portion of the fruits. This is wrong

and should not continue. To secure to each laborer the whole product of his labor or as nearly as possible is a worthy object of any good government. * * *

The burdens you are putting on the taxpayers by these objectionable disciplines are unjust, unreasonable, and oppressive, and transgress the blood sacrifices they made in the last World War. You can only do it by an abuse and usurpation of office.

In an executive session, under oath, I would like to submit evidence to concretely substantiate the grievances against which the people have a just complaint to obtain redress either here and now or in the Supreme Court.

The CHAIRMAN. Mr. Doyle.

STATEMENT OF RICHARD S. DOYLE, WASHINGTON, D. C., REPRESENTING THE CAPITAL YACHT CLUB

Mr. DOYLE. I represent the Capital Yacht Club of this city, Washington, D. C. Mr. Chairman, I am not here seeking relief. I am just asking this committee if it will kindly consider the clarification of a provision in this section 543, which undertakes to enlarge the definition of "dues." The Capital Yacht Club is representative of boat clubs, many of which are on this coast and on the other coast and on Chesapeake Bay, and it and its members pay taxes on dues. Under section 558 of this bill there is also imposed a graduated tax on the use of boats, so that by enlarging the definition of "dues" in this act, section 543 (b), we presume that the Ways and Means Committee did not intend to tax as dues a facility which boat clubs generally afford to their members, and that is the provision of berths for dockage and storage of boats. Now, the definition as enlarged in this act reads:

> The term "dues" includes any assessment, irrespective of the purpose for which made, and any charges for social privileges or facilities, or for golf, tennis, polo, swimming, or other athletic or sporting privileges or facilities for any period of more than 6 days.

We believe that the Treasury Department may undertake to tax the rental of berths for dockage and wharfage facilities as "additional dues."

The CHAIRMAN. You mean include the fees payable for those services in the regular dues?

Mr. DOYLE. Yes. Now, those are distinctly service privileges as distinguished from these other services. While the proposed amendment is evidently intended only to cover club charges for social athletic, and sporting privileges and facilities, as distinguished from service charges, yet the language of the section is not too clear, and the reason I call it to the committee's attention is this: It is a service rendered members, and if a boat owner is taxed for that service as part of his dues, he will naturally take his boat to a shipyard or some commercial place and store his boat there in preference to leaving it at the club.

The act as it now stands defines "dues" to include assessments, and doesn't specifically include these other classifications.

Senator CONNALLY. The point is that if they didn't do that they would just charge nominal dues. The charge would be for these other services with nominal dues.

Mr. DOYLE. That may be true; but I call your attention to section 558 of this same act, that imposes a graduated tax on boats ranging from $5 to $200. Now, we don't think that the Ways and Means Committee intended to impose an added tax on the service of boats where they have imposed in the same bill a graduated tax on the use of boats. Now, we are not asking for relief; we would like to have this clarified.

Senator CONNALLY. You mean yacht clubs and such?

Mr. DOYLE. We are not asking for relief. If it is intended to tax the use of boats, let us put it all in one place and not leave it open in such a way that these services may be construed to be such as liable for dues, because the services of dockage and wharfage are not sporting or social privileges; they are service privileges.

I want to correct one impression that seems to exist, namely, that every yacht owner is one of the wealthy class who may be easily hit for revenue. That is not true. In our club of 126 members there are only 8 members in the club that maintain a boat hand on their boats. The large number of boat owners up and down the coast and on Chesapeake Bay are young men who have small boats that they build, operate, and maintain themselves; they do not have a crew.

Senator CONNALLY. That is because they like to run the boats themselves.

Mr. DOYLE. Well, they don't have anyone on the boat as an employee.

Senator CONNALLY. That is because they want to do the work themselves; they don't go to work in the boat, do they? It is not a necessity.

Mr. DOYLE. No; it is a luxury and taxed as a luxury when they pay their dues—their tax on the use of the boat.

Senator CONNALLY. What are the dues in your club?

Mr. DOYLE. Just nominal; $25 a year.

Senator CONNALLY. Exactly. We wouldn't get any tax.

Mr. DOYLE. You get a tax under this bill, an increased tax. They have lowered the exemption in this bill.

Senator CONNALLY. You want either the dues exempted or the boats exempted; is that the idea?

Mr. DOYLE. No. We are asking that the dockage and wharfage charges not be included as a part of the dues.

Senator BAILEY. In other words, it is a question of definition. You think dockage and wharfage should by definition be excluded from the term "dues"?

Mr. DOYLE. Yes; as services, as I have indicated.

Senator GUFFEY. What is the average charge for a berth?

Mr. DOYLE. From $2 to $22 a month, depending on the size of the boat.

Senator GUFFEY. How many months of the year?

Mr. DOYLE. Twelve months of the year. The average is $10 to $15 a month. Those men won't pay that. They will go right over to a shipyard or some place on the bay where they aren't taxed, and they will get the same service.

Senator BAILEY. In other words, it is your contention they wouldn't have to pay the tax if they berthed their ships some place else?

Mr. DOYLE. Correct.

Senator BAILEY. But under a possible construction they would or might have to pay a charge if they berthed it at the club?

Mr. DOYLE. That is right.

Senator CONNALLY. You mean they would go to those other places for 10 or 11 percent tax?

Mr. DOYLE. Yes; all they have to do is to go one block.

Senator CONNALLY. You mean to say that to save 10 or 11 percent, to save that small amount, they would take their boats some place else?

Mr. DOYLE. Yes; it would be cheaper.

Senator GUFFEY. How much cheaper?

Mr. DOYLE. I don't know how much exactly. A berth here costs $15 a month; you can rent one for $3 a month in Galesville.

Senator CONNALLY. A man wouldn't go to Galesville to save that small amount of money. Do you think he would go over there to save 11 percent?

Mr. DOYLE. Well, they do. It is better cruising; it is a better place all around.

Senator CONNALLY. Well, that is another element, better cruising, but that wouldn't mean that they would go over there just to save this 11 percent. How far is it?

Mr. DOYLE. About an hour's drive.

Senator CONNALLY. An hour's drive. An hour's drive each way and gasoline. You think they would travel 2 hours and the gasoline they would use on the ground to save $1.65?

Mr. DOYLE. Well, he gets better service there than he gets here.

Senator CONNALLY. Well, then the tax wouldn't be driving him from Washington, would it?

Mr. DOYLE. No; I don't think so.

Senator DANAHER. How much does it take to put a boat in the water and take it out again?

Mr. DOYLE. That depends on the length of the boat.

Senator DANAHER. Approximately.

Mr. DOYLE. On the railway, 25 cents a foot.

Senator DANAHER. You don't include that in dues?

Mr. DOYLE. No; that is a service charge.

May I ask that the letter addressed by the club to the committee under date of August 7 be included in the record?

The CHAIRMAN. Yes; that will be included.

(The letter is as follows:)

CAPITAL YACHT CLUB,
Washington, D. C., August 7, 1941.

Hon. WALTER F. GEORGE,
Chairman, Senate Finance Committee, Senate Office Building,
Washington, D. C.

DEAR SIR: Section 543 (a) of the proposed Revenue Act of 1941 (H. R. 5417, 77th Cong., 1st sess.) proposes to amend section 1712 (a) of the Internal Revenue Code to enlarge the definition of the word "dues" in order to tax as club dues certain privilege fees and assessments not now subject to tax; specifically any charges "for special privileges or facilities, or for golf, tennis, polo, swimming, or other athletic or sporting privileges or facilities, * * *."

While the proposed amendment is evidently intended only to cover club charges for social, athletic, and sporting privileges and facilities, as distinguished from service charges, yet the language of the section is not too clear, and we therefore respectfully request that a clause be added to the amendment definitely stating what is meant by the term "facilities."

This club makes a charge to members for berths for dockage and storage of their boats, which is a service in direct competition with privately owned and operated shipyards and wharfage companies, and such service charge should not be taxed as club dues.

We suggest that there be added to section 543 (b) (a) the phrase, "not including charges to members of boat clubs for dockage, storage, or other servicing of their boats."

Section 558 of the bill imposes a tax graduated in amounts from $5 to $200 on the use of boats, and it is reasonable to assume that Congress does not intend to impose a further tax on the service and dockage charges for care and storage of such boats.

We respectfully request the privilege of appearing before your committee in this matter.

Very truly yours,

DANIEL H. FOWLER, *Secretary.*

The CHAIRMAN. Anything else?

(No response.)

The CHAIRMAN. That is all. The committee will recess until 10 tomorrow morning.

(Thereupon, at 4 p. m., an adjournment was taken until Wednesday, August 13, 1941, at 10 a. m.)

REVENUE ACT OF 1941

WEDNESDAY, AUGUST 13, 1941

UNITED STATES SENATE,
COMMITTEE ON FINANCE,
Washington, D. C.

The committee met, pursuant to adjournment, at 10 a. m., in room 312, Senate Office Building, Senator Walter F. George (chairman) presiding.

The CHAIRMAN. The committee will come to order.

Judge Fletcher, I believe you are the first.

STATEMENT OF R. V. FLETCHER, WASHINGTON, D. C., GENERAL COUNSEL, ASSOCIATION OF AMERICAN RAILROADS

Mr. FLETCHER. Mr. Chairman, my name is R. V. Fletcher. I live in Washington. I am a lawyer, after a fashion, and counsel for the Association of American Railroads.

The Association of American Railroads is a voluntary organization composed of substantially all of the class I railroads of the United States, and, of course, by a class I railroad, I have reference to railroads who have total annual operating revenues of $1,000,000 or more.

Senator CONNALLY. Is that the classification of the Interstate Commerce Commission?

Mr. FLETCHER. That is the Interstate Commerce Commission classification, Senator.

I might say in that connection that there are some railroads that belonged to that class originally because they had a revenue of over $1,000,000 a year that still remain in that class technically, although their revenues have dropped below that figure in recent years.

I suppose the Association of American Railroads represents substantially 98 percent of the operated mileage in the United States, and I appear on behalf of that important group not for the purpose of expounding any kind of philosophy of taxation but for the purpose of discussing two or three amendments to this tax bill as it passed the House which seem to us to be sound.

Of course, we appreciate the fact that there is the necessity of increasing the revenues of the Government substantially. Nobody can hope to escape the increasing burden of taxation, and everybody should be willing and glad to make his contribution toward the expense of the Government. It is not my purpose, therefore, to talk about the general aspects of the tax bill nor its objectives. I assume that this committee will endeavor to increase the amount of taxes by a substantial amount.

With that objective we are certainly in sympathy.

I have understood, however, Mr. Chairman, that it is also the aim of the Congress to distribute this tax load in such a way as to make it equitable, insofar as equity can be accomplished under the present circumstances, and particularly that the tax burden should fall upon those who have the greatest ability to pay, and that it should not be imposed in such a way as to retard industry or destroy it to any greater extent than is absolutely necessary. There is the principle of diminishing returns that has to be kept in mind. It would be useless to tax to the point where revenue would dry up by reason of the burden of taxation, and I take it that the ability to pay being one important consideration. The committee is also interested in finding out whether any particular proposal in this tax bill bears with peculiar hardship upon some particular industry.

I shall discuss principally in this statement of mine the so-called special 10-percent tax on excess profits applicable to business enterprises that deem it proper to select the invested-capital method of determining the excess-profits tax. I shall have nothing to say about the income tax, or the rates on ordinary excess-profits taxes, but, as I have said, I will try to show to the committee, if I can, that this special 10-percent excess-profits tax, so-called, bears with peculiar, and I think with unfair and discriminatory, hardship upon the railroad industry that I try to represent.

However, before I address myself to that most important topic, may I take just a minute to refer to one phase of the bill which deals with excise taxes, and particularly with the 5-percent tax on passenger transportation, as that appears on page 73 of H. R. 5417, in the print which came to the Senate committee.

You will note that there is imposed upon the transportation of persons a 5-percent tax, to which we take no exception since the act is so written as to make it apply equally to transportation by motor vehicle, by air, by water, and by rail, and that is eminently fair.

Senator CONNALLY. Does it, or not, apply to all of them?

Mr. FLETCHER. It does.

Senator CONNALLY. What page is that on, Mr. Fletcher?

Mr. FLETCHER. Page 73. That is section 3469, paragraph (a). But in paragraph (b), where there are some exceptions or exemptions from the tax, you will note that there is an exemption in the case of commutation or season tickets for single trips of less than 30 miles. We think that 30-mile limitation is too short. The purpose of the exemption, I take it, Senators, was to exempt that class of season or commutation tickets which are used every day, or practically every day, by persons who work in the city and who live in the suburbs.

Senator CONNALLY. You will have to raise the 35 cents, will you not?

Mr. FLETCHER. I will come to that in a moment, Senator, with your permission.

I do not think so.

Senator CONNALLY. I do not think that it is important how far they go, if they charge not over 35 cents.

Mr. FLETCHER. That is for single-trip tickets, the 35 cents, and there is a distinction made between ordinary passenger transportation and the transportation which is accomplished through the com-

mutation and season tickets in what might be called suburban territory.

You see, that 30-mile limitation does not take care of suburban territory in cities like Chicago and New York. If you leave that 30-mile provision in there you have persons who are using season tickets and commutation tickets, some of them living 29 miles away and others living 31, 35, and 40 miles away, and it is a clear discrimination in favor of those who are nearest the metropolitan centers and is a discrimination against others. In Chicago, for instance, with which city I am perhaps more familiar than any other in the United States, the suburban territory on the Northwestern Railroad runs as far as Kenosha, Wis., and that is 51 or 52 miles. Now, all the way from the city of Chicago to Kenosha, there are great numbers of people who work in Chicago and buy these season tickets, 10-ride tickets, tickets that are good for a month, tickets that are sometimes good for a greater length of time, and to accomplish the ends sought by the House committee I think that 30-mile provision should be changed to 60 miles.

Senator LA FOLLETTE. As a matter of fact, Judge, does the railroad sell these commutation tickets only to people who are regular commuters?

Mr. FLETCHER. No; they do not. They sell them to anybody else who wants to use them, Senator.

Senator LA FOLLETTE. So the mileage limitation really is not very important.

The CHAIRMAN. It is intended, Judge, to take care of that situation by the language "or to amounts paid for commutation tickets for 1 month or less."

Mr. FLETCHER. Some of those commutation tickets, Senator, are good for periods of a month, some of them are sold for 2 months, and even for a year in many cases.

Senator GERRY. Do not you have very strong competition in those distances with automobiles?

Mr. FLETCHER. Oh, yes, Senator; indeed we have.

Senator GERRY. Therefore, to increase this limit would be liable to decrease the automobile traffic, and where they want to conserve gas, that might be helpful.

Mr. FLETCHER. That is a very good suggestion.

Senator CONNALLY. Judge, it looks to me like the language "or to amounts paid for commutation tickets for 1 month or less" would include those. If you strike out "for 1 month or less," you would have it, would you not?

Mr. FLETCHER. Possibly so, Senator.

Senator CONNALLY. It says "or to amounts paid for commutation tickets for 1 month or less."

Mr. FLETCHER. As the thing is written now; yes. We had construed that language to mean to have two classifications, one where there were ordinary commutation or season tickets regardless of the length of time that they might be good for but limited to 30 miles.

Senator CONNALLY. Why not say "for 1 month or more," instead of "less"?

Mr. FLETCHER. Some of them might be for less.

Senator CONNALLY. There may be tourists up there.

Mr. FLETCHER. It would be better to strike out "for 1 month or less" entirely.

Senator CONNALLY. If a man buys a ticket for less than a month he is not a permanent residential commuter, he is on a joy ride, and he ought to pay.

Mr. FLETCHER. Here is what happens: You buy 10-ride tickets sometimes in these commutation cases and they are good for any period less than a year, and he may use up that 10-ride ticket in much less than a month.

Senator CONNALLY. He is not doing it regularly on his business or he would want it for longer.

Mr. FLETCHER. He does, Senator, because those 10-ride tickets are usually unlimited, and his family can use them.

Senator CONNALLY. All right.

Mr. FLETCHER. Anyhow, that is my suggestion, that the committee give consideration to extending that distance from 30 miles to 60 miles to take care of situations that I am sure would be thereby relieved in Chicago and New York, and perhaps other places.

One other slight suggestion on that. You notice the peculiar language used there, "shall not apply to amounts paid for transportation which do not exceed 35 cents." Now, suppose a man goes up to a ticket office and says, "I want to buy four tickets here, single tickets." The fare in each case is less than 35 cents per person, but he says, "I want to buy one for myself, one for my wife, one for each of my two children." In that case he will pay out $1.20 for the four tickets, or very likely he would want to buy a round-trip ticket.

Senator CONNOLLY. He would just hand the money to the old lady and let her buy them.

Mr. FLETCHER. That is one way to do it, Senator. You can distribute them around like you distribute your tickets for a baseball game, each person holding his own ticket. I realize that; but that would be an unnecessary and awkward arrangement. Furthermore, the round-trip ticket situation enters into it.

What we are suggesting is—I do not want to take too much time on it—after the word "transportation" in line 17 there be added the words "for trips where the regular railway fare does not exceed 35 cents." If the committee will have its experts look at that suggestion, I shall be very much obliged.

Now, the next suggestion I want to make, and I make it with a little hesitation——

Senator SMATHERS (interposing). Before you leave that subject, Judge, do not you think the draftees and soldier boys ought to be excluded?

Mr. FLETCHER. I was just coming to that, Senator.

Senator SMATHERS. I thought you were leaving that out.

Mr. FLETCHER. I was about to put forth that suggestion. The special rate the railroads have made, after conference with the Government officials, is 1¼ cents per mile for selectees, or perhaps I should say for anyone who is serving his country in military camps, if they buy round-trip tickets, the purpose being to make as low a rate as possible to persons now in the camps serving their country in a military capacity, when they want to go home, or go back on holidays, week ends, or upon occasions of that kind. There have

been bills introduced into the Congress to make that rate 1 cent a mile. One bill was thoughtful enough to say that the Government would make up the difference between the 1 cent a mile and the regular rates on the railroads. I do not know whether those bills will prevail or not, but if you put this 5 percent tax, in the form in which it is here, in the act, providing, as it very properly does provide, that that tax shall be paid by the buyer of the transportation, that will make the cost fall on the selectees, if I may use that term to represent all of those in the Army, and we had thought that the committee might very well give consideration to exempting from the 5 percent tax amounts paid under these special tariffs which have been filed with the Interstate Commerce Commission by the railroads applicable only to persons now in military service. I am very much afraid if you put that additional tax on the soldiers it will result in a good deal of complaint, and perhaps a demand that the Government should pay that tax or in some form or other changing the present law, which would be a disadvantage to all concerned.

Senator CONNALLY. You would provide that it must uniform?

Mr. FLETCHER. That is right. I think the tariff provides, in making the 1¼-cent rate applicable it must be uniform.

Senator VANDENBERG. The soldier also has to get a certificate from his commanding officer?

Mr. FLETCHER. That is right. He has to be in uniform, he has to get some kind of credentials identifying him as making one of these trips home and back. He has to buy a round-trip ticket.

Senator VANDENBERG. It is called a furlough rate and applies only to furloughs?

Mr. FLETCHER. That is right. I do not think there should be any difficulty in the committee finding language which would exempt that, if the committee so decides.

The CHAIRMAN. That exemption was made in the admission tickets.

Mr. FLETCHER. I was going to refer to that. I will not particularly stop to refer to that, but on pages 44 and 45 of this bill, section 541, soldiers in uniform are allowed to go to amusement places without paying the amusement tax, which is a pretty good precedent, I think, for the suggestion I am bringing forward.

I have one other observation before I attempt to discuss the 10-percent tax, and that is with reference to the capital-stock tax, applicable to all corporations. That has been substantially increased in this bill, and I am not making any complaint about that at the moment, but you will recall that in the act of 1938 which imposes a capital-stock tax it is provided that the taxpayer shall have the right to make the declaration of value every 3 years. That is, he can make a declaration of value in 1938, he can make a declaration of value in 1941. So that coincides in time, I mean, with this particular bill. So that in 1941, as I recall the provisions of the 1938 statute, taxpayers have a right to make a declaration of value, I mean a new declaration of value.

Now, it is provided in the law that taxpayers may have a right to make a declaration of value in 1939 and in 1940, but only upward. You can make a declaration upward in 1939 and 1940, but you

cannot make a declaration except to increase the amount of valuation placed upon the capital stock.

Now, I think that the members of this committee understand the theory that underlies this capital-stock tax. No effort is made by the Government to police the matter. It is not a question whether you have declared in fact the real value of the capital stock, it is an arbitrary selection you are permitted to make. You can put your own value on the capital stock. If you make it high it increases your capital-stock tax but decreases your tax elsewhere under certain circumstances. If you make the capital stock value low, why, you decrease the amount of your capital-stock tax, but it increases the tax in other directions if certain things happen.

Somebody over in the House spoke of this tax as being a crap-shooting proposition. You gamble, so to speak, risk your judgment on what is going to happen.

Now, what we are asking here, Mr. Chairman and members of the committee, is that this law be so written that the taxpayer be permitted in 1942 to make a new declaration of value. I say that for the reason that we are now facing a new law, many of the provisions in this act having to do with excess profits and other kinds of taxes, and we are facing a very uncertain state of affairs. Nobody knows what is going to happen in business; nobody knows what is going to happen in the field of international relations; nobody knows whether 1942 is going to be a period of increased or decreased prosperity. It seems to me, in face of the fact, that we have a new law, introducing very uncertain factors into the situation and by reason of the present troubled and uncertain condition of the world, there ought to be given the privilege to the taxpayer of making a new declaration of value in 1942 at least, when they can see a little more clearly just what is going to happen, and I make that suggestion hopefully.

I come then to the subject to which I wish to devote most of my attention, and that is this 10-percent excess-profits tax. I think that was discussed yesterday, Senators, by Mr. Dorrance, I believe it was, who was a coal operator. I had the pleasure and profit of reading his testimony, and I thought he made it very clear to this committee just how that would operate most injuriously to the coal industry, by reason of the fact that in the so-called base period the prices of coal were fixed by a very remorseless rule of competition, whereas in the present time, in the current year, they are fixed by public authority, and by reason of that the coal industry is able to show better returns in the current year than in the base period years, 1936, 1937, 1938, and 1939. Along that same line I want to make a special plea for a few minutes on behalf of the railroad industry of the country. I do not think it is necessary, Senators, for me to spend time in trying to explain just how this excess-profits tax works out, further than to say that there is given to all corporate taxpayers the right to select whether their excess profits shall be calculated according to the average earnings method, sometimes called the income method, or whether they shall select the invested capital method. That has been the subject of much debate. My recollection is that the Treasury, in its appearance before the House committee and before this committee, looked with disfavor upon the right to select the average

earnings method and favored very strongly the invested capital method.

Of course, there are two schools of thought on that subject. If you consider that this excess-profits tax should be imposed only upon those who are earning money in the current year, in amounts substantially in excess of their normal earnings, if that is the theory of an excess-profits tax, then the average earnings method seems to me to be sound. On the other hand, if you are going to say that all earnings are excessive if they exceed a certain proportion of the investment, whether in time of peace or in time of war, or normal times, or in disturbed times, if that is to be the theory upon which you proceed then the invested capital method would have its appeal.

But the point I am making, Mr. Chairman and Senators, is that the Congress ought to decide one way or the other. So far it has held to the view that the taxpayer should have the option of selecting which one of these methods he prefers, but this bill, as it comes to you from the House, combines the two methods in a way which I shall try to explain, and if the taxpayer selects the invested capital method and finds that the credit which the act allows him wipes out his earnings to the point where there is no excess profits taxable income, it is not satisfied with that but goes on then and applies to him the average earnings method to the extent of taxing him at 10 percent on the amount which his earnings in the current year exceed average earnings in the base period. So it gets the poor, unfortunate taxpayer going and coming, and for that reason it seems to me it presents a real injustice.

The committee will find on page 43, the bottom of the page, and over on page 44 of the House report (H. Rept. 1040, 77th Cong., 1st sess.), not the bill but the House report, how this works, and it is explained very clearly. I shall not take the time of the committee to go over that, but it is there very clearly stated as to just how you go about taxing the man whose interests demand that he should select the average earnings method over and beyond the taxes imposed by that method to the extent of 10 percent of the excess of his earnings in the current year over the base year.

Well, that means this: Here is a corporation, or a line of business with comparatively large investments. Somebody has described that as business built in a high-cost period. They have had, for one reason or another, an exceedingly unfortunate experience in the base period, 1936, 1937, 1938, and 1939. At the present time their earnings are better; they have gone through a period of starvation, so to speak, and the time has come when there is an opportunity for them to rehabilitate their property, reduce their debt, and recuperate to a certain extent. This tax bill comes in and says, We will penalize you by reason of the fact you are earning more now than in the base period. Although it appears you are not earning any more than a fair return upon the value of your property at the present time, although the 7 percent credit which the act permits has wiped out your excess earnings, still, by reason of the fact that you are earning more than you did in the starvation period, we will find out how much more you are earning now than you did then and tax it at the high rate of 10 percent. That is the one thing about which I most bitterly complain here at this time.

I do not think, gentlemen, that this method can be justified on any logical basis. I do not think it can be justified with due regard to consistency. Either you are to be taxed in accordance with your experience in the base period compared to the present time, or you are to be taxed upon the theory that you are entitled to earn, without being subjected to excess profits tax, some return upon your invested capital. I say with great deference that I cannot understand how the Treasury can justify such a theory as this, which is inconsistent either with the one method or the other.

There is support, of course, as I have tried to say, in logic and in reason, for the selection of the average earnings method, or in many cases for the selection of the invested capital method, but to combine the two together I do not think is sound.

Senator WALSH. Do you care to state which one you prefer?

Mr. FLETCHER. Now, that is a question, Senator Walsh, that each corporation must decided in the light of its own experience.

Senator WALSH. Suppose Congress decided to make its policy one of these methods, which one would you prefer?

Mr. FLETCHER. Looking now at the interests of my clients, if you mean that, Senator Walsh, all of the railroads, except three or four, possibly a few more than that, are compelled to select the invested-capital method, by reason of the fact that they have relatively a large capital investment and very poor earnings in the base period. I would not be here if that was not the fact, I should not be troubling this committee.

Senator BYRD. Do you think that you can apply that to many other corporations?

Mr. FLETCHER. In regard to many other corporations it would be very different.

Senator BYRD. It might be the reverse.

Mr. FLETCHER. It might be quite the reverse. I hope I violate no confidence when I say I was informed yesterday by a well-informed gentleman, much more familiar with business conditions than I am, that probably three-fourths of the corporations in the country would prefer the average-earnings method. That is not true of the coal industry, that is not true of the lumber industry, and that is not true of the railroad industry. By reason of the poor earnings in the base period, for reasons which I could explain if I had the time and you had the interest, and by reason of the comparatively large investment in this class of business, they are compelled to select, for the most part, the invested capital method.

You understand this special tax, Senator, does not apply if you take the average-earnings method.

Senator WALSH. I understand.

Mr. FLETCHER. That has no room in the picture at all. It only applies to those who select the invested-capital method.

Now, of course, there would not be so much injustice in this, Mr. Chairman, if the base period was other than the years 1936, 1937, 1938, and 1939. If we had some way of finding out what was a really normal period for the railroad industry it would be different. If you take 2 years in that period and 2 years in the 1920's it would make a very different picture, or if the committee could see proper to give the taxpayer the right to select 3 years out of the 4 and divide

his total by 3 rather than to require all 4 years, maybe it would furnish a certain measure of relief, although I earnestly ask the committee to exclude from the bill entirely this special 10-percent tax.

Now, as I have said in reply to Senator Walsh, there are a few railroads that would be able to survive, or at least not be subjected to great hardship by reason of this special tax, and in fact there are a few railroads that will probably select the average-earnings method. I refer particularly to railroads that are located in what we call the Pocahontas district and have had a good deal of luck in hauling coal even during the period of depression, roads like the Norfolk & Western, and others of that type; but in that connection, also, I would like to mention a question which inevitably arises here and to which I would like to address myself a little later more in detail.

This bill changes the method of deduction. Under the present law you deduct income tax from the excess profits taxable income before you make your calculation as to the excess-profits tax, but you are not allowed to deduct from the taxable income, in determining the income tax, the excess-profits tax. This bill proposes just the reverse of that process. It proposes to prohibit you from deducting the income tax from earnings to get a base to calculate the excess-profits tax, but to permit you, as a compensation for that, to deduct the excess-profits tax from the income-tax base. Now, that fact, of course, as the House committee has pointed out, reduces the 7-percent credit in reality to 4.9, because you pay 30 percent income tax and 7 percent of 30 percent is 2.1 percent, and subtracted from 7 percent leaves you 4.9 percent.

This situation would be corrected to some extent if the committee could see proper to go back to the present rule and allow the deduction of income tax before excess-profits tax is calculated.

Well, I started to say, as illustrating the unfairness to railroads—if that is not too strong a term—of applying this 10 percent excess profits to the excess of their income in the current year over the base year, to the poor earnings of the railroads in the base year; I have a table before me, and I do not want to encumber this record, Mr. Chairman, with too many tables, but I have a table before me here which shows the situation on the railroads, class I railroads, in the United States in the years 1936, 1937, 1938, and 1939.

In the year 1936, the net railway operating income—and that means the income of the railroads before you deduct their interest and rents—was of such a figure that it allowed only 2½ percent upon the property investment. The net income of the railroads that year, which means income of the railroads after they have paid their interest and rents, amounted to only $164 630,000. But that does not tell the whole story. To that amount there had to be charged profit and loss debits in very considerable amounts representing, for the most part, the cost of retirements, which reduced the taxable figure for that year down to $6,819,000.

Senator BYRD. What year is that?

Mr. FLETCHER. That is 1936, and that is the best of the 4 years for the railroads, by far the best of the 4 years.

Senator BYRD. You mean all the railroads only had a net income of $164,000.000?

Mr. FLETCHER. All the railroads had a net income of $164,000,000, after they paid their interest, before any dividends were paid, but out of that they had to pay the cost of retirements, capital charges, profit-and-loss charges, as it is called, which reduced the taxable income down to $6,819,000 in the year 1936, the best of the 4 years.

Senator BYRD. What is the capitalization? What is the investment?

Mr. FLETCHER. The investment upon which that is counted—I have the exact figure here, but stating it generally, it amounts to about $25,000,000,000.

Senator BYRD. That means a profit of $6,000,000 on an investment of $25,000,000,000?

Mr. FLETCHER. That is the picture. That is taxable income, you understand.

Senator BYRD. That is approximately the actual profit, is it not?

Mr. FLETCHER. That is right. Now, in 1937, when business had begun to fall off, the return on the investment was 2.27 percent for the railroads of class I, with the figure of $98,000,000 of net income which, after making profit and loss charges, produced a deficit of $11,870,000 in taxable income.

Now, 1938 was the poorest of the 4 years. There the return was only 1.43 percent upon the investment. There was an actual deficit, after the payment of fixed charges, of $123,471,000, which figure grew to a deficit of $224,000,000 after the payment of the cost of retirements and other charges to profit and loss.

In 1939, when the return was 2.25 percent, business had picked up a little; the net income was $93,000,000, and after making the proper deductions for retirements there was $202,813,000 of a deficit. The average deficit for those 4 years on the class I railroads was $108,000,000.

Now, the result of that was, with these charges to profit and loss, that the capital investment on the railroads was reduced something like a billion dollars in those 4 years and the previous period of depression.

Senator BYRD. Do those figures contemplate deduction for depreciation and anything that is allowable under the Federal income tax?

Mr. FLETCHER. Yes; that is true. That is, the last figure I gave does so contemplate.

The point I make here is that these 4 years which, if taken for the base period, certainly do not represent, at least I hope they do not represent, a normal period for the railroad industry.

Senator BYRD. Why, Mr. Fletcher, are you so much concerned about that when you can select the invested-capital method?

Mr. FLETCHER. For this reason, Senator: We are making a little money this year, for the first time in a long time. You take the earnings of a railroad and you use the invested-capital method, and you apply a credit of 7 percent—it is 8 percent on the first $5,000,000 but in most of the large railroads that does not go very far—you find that wipes out the excess profits, we will assume for the purpose of the argument, but here comes along this law and says, even though you do not have any tax to pay in the way of legitimate excess-profits tax—if I may use that expression—after you have selected the invested-capital method we are going to apply the average earnings

method to you. We are not satisfied with the fact that you have earned nothing over and above 7 percent of your invested capital, you are earning now more money than you earned in the base period, and we are going to get after that. So they subtract from the amount you earn in the present year the amount earned in the base period, which in most cases was zero in the case of the railroads, and they put a special 10 percent tax on that excess. It is that last 10 percent I am talking about and nothing else.

Senator GERRY. What is the condition of your roads due to that low earning period? Has that made it difficult for you to make replacements?

Mr. FLETCHER. Senator, the tendency, the natural tendency, when earnings were poor, with so many freight cars not being used, was not perhaps to neglect the maintenance of the cars that were actually in use but to allow a larger accumulation of what we call bad-order cars. Now, at the present time, the bad-order car situation of the American railroads is the best in the history of the industry. Normally, you would think of 6 percent as a pretty fair condition, when only 6 percent of the cars are in bad order; they are now down to less than 3 percent. That is brought about by the expenditure of money in repairing cars, trying to get ready for the traffic which now confronts them and the emergency with which they are now confronted, the emergency being the necessity for handling the traffic in the interest of national defense.

Senator HERRING. To what do you attribute the earnings this year as contrasted with the 4 base years?

Mr. FLETCHER. That is a hard question to answer. I would say, with all candor, perhaps, that question has qualities of embarrassment, in the light of just what the philosophy of this act is. In other words, it might be said if it is all attributable to the defense program of the country you ought to pay a special tax on it. I am not able to say to what extent the increased earnings are attributable directly to the defense program. Doubtless to some extent. I have no doubt that program has increased it, but I do not think it is responsible for all the increase. Take for instance 1938 as compared with 1936. There was no defense program in 1936, and yet the earnings of the railroads were so much better than they were in 1938 that I venture to entertain the hope, Senator, that if we had no complications abroad and no special emphasis upon national defense at this time there would have been an increase in the normal business of the country. At least I hope so. How much was attributable to the one and how much to the other, I am not sufficiently able and prophetic to state.

The CHAIRMAN. Judge, you know full well it is exactly on the theory that while you have not reached the credit you would decide to take on the invested capital, nevertheless it is due to the defense effort, the defense spending. Many of the large, heavily invested capital corporations have made very great progress, and there has been a great increase. It was on that theory that this added 10 percent was placed on it.

Mr. FLETCHER. In other words, it is not an excess-profits tax but a defense tax.

The CHAIRMAN. That is what it is. It is not an excess-profits tax at all.

Mr. FLETCHER. It could not be an excess-profits tax.

The CHAIRMAN. No; because the answer to that is you have not made excess profits under any definition of the law.

Mr. FLETCHER. Quite so.

The CHAIRMAN. Whether it is a logical tax or not, I have great difficulty in sustaining it.

Mr. FLETCHER. We might all agree if we were not, some of us at at least, embarrassed by obligations in one way or another, we might all agree it is not logical and it is not an excess-profits tax, but I am wondering whether there is merit or justification or justice in putting a tax upon an industry which has, perhaps, we might concede for the purpose of the argument, improved its earnings by reason of the defense effort, whether that alone is sufficient. We must bear this in mind, Senator, which I purposed to express a little later, but in order to qualify ourselves for a defense effort there has had to be a great expenditure of funds in getting ready to do that defense work. The railroads of the country have spent enormous amounts in repairing their cars, as I just stated a moment ago, and in purchasing new cars, and they have given orders now, Senator, for the acquisition of new equipment which taxes the capacity of the car manufacturing plants, and the only thing that is holding them back toward the acquisition of a large amount of new equipment is the scarcity of steel. There are no priorities, you know, in transportation.

Priorities have been granted with respect to the manufacture of steel and the production of aluminum, this, that, and the other, but the transportation agencies of the country, railroads and trucks and the like, have asked for no priorities, and they have been required to put into effect no priorities, because they are taking care of the load and burden offered to them even with the difficulties that surround them, and they would be perfectly able to take care of it at their own expense and not Government expense; at their own expense if they were able to obtain the material to make new cars and repair the old cars.

I wish I had time, because I think it would perhaps be interesting, to call the attention of the committee to the earnings of individual railroads, some of which you know about, in this base period. I have three sheets, which I shall merely mention and pass over, classified as eastern railroads, southern railroads, and western railroads, and in the case of the western railroads, a very important section of the country in which I have lived most of my life and for which I have a great deal of concern, I think you can, even from that position, see the red figures on that statement [indicating], and those red figures represent deficits rather than income during the base years. But I will pass that over.

Now, there is this thing also to be considered in the case of the railroads: Remember it is a regulated industry, it is an industry affected with the public interest, as the lawyers say. The railroads do not determine their rate of return, they do not fix their rates, they are fixed by public authority. Not only are their rates fixed by public authority, but their wages are fixed by public authority to a very great extent.

We have here on the one side the income of the railroads determined by their rates fixed by the Interstate Commerce Commission,

and on the other side the expenses of the railroads fixed by the Railway Labor Board, fixed by boards, rather, under the Railway Labor Act. It is a public utility essential to the public interest. The country has to have their services. They owe this obligation to the public. They owe the obligation to give service in a time like this when national defense is being particularly emphasized. So that, without the ability to control their expenses, and without the ability to control their revenues, they were not in the position during this base period to improve their condition, and in that respect I think it becomes a rather unique industry.

One thing I would like to mention and that is that during this very period when they were having these poor earnings the railroads made substantial expenditures for additions and betterments. They had to do it. Here was the year 1936, the railroads spent $298,000,000 for additions and betterments to their property. That does not mean ordinary repairs now. Ordinary repairs are charged to operating expenses. That means additions to capital.

In the year 1937 they spent $509,000 000. In 1938, that poor year I spoke about when the deficit was $123,000,000, they spent $226,000,000 for additions and betterments.

Senator BYRD. Mr. Fletcher, in that poor year how many railroads in the United States had a net income?

Mr. FLETCHER. I have that figure here, Senator, as it happens.

Senator BYRD. That is 1938.

Mr. FLETCHER. That is 1938. Judging just from my memory—I happen to have it here—57.57 percent of the class I railroads had a deficit that year, and, of course, the difference between that and 100 percent is 42.43 percent who were able to show some net income in that year.

Senator BYRD. How many class I railroads are there?

Mr. FLETCHER. There are about 130. Somebody could give me that figure. I dare say, among my colleagues here. I do not happen to have it myself.

Why were these additions and betterments necessary? They were necessary, of course, in order to go on and serve the public and give the service that the public interest demands and get ready for emergencies that may come along. As the result of those large expenditures, and particularly by reason of the fact that in the 1920's, when there was a comparatively prosperous time, the railroads spent $8,000,000,000 in improving their property, but for that they would not be able to carry the load they are carrying now. They would not be able to carry the load but for the fact that these additions and betterments had been made not only in this base period but previously to such a large extent that they were in a position to increase the traffic that they handle without undue difficulty.

Senator BAILEY. Can you tell me what has been the average dividend paid to railroad stockholders?

Mr. FLETCHER. Senator, that is a minus figure.

Senator BAILEY. What?

Mr. FLETCHER. That is a minus figure, if you take all the railroads into consideration.

Senator BAILEY. Take the class I railroads.

Mr. FLETCHER. I mean the class I railroads. Some railroads have paid dividends pretty steadily. The Pennsylvania Railroad maintained its record of paying a slight dividend.

Senator BAILEY. But most of the railroads have not been paying dividends?

Mr. FLETCHER. Oh, the "dividends" is a kind of lost term. We do not use it any more. Nobody thinks about it any more in the railroad business.

Senator BAILEY. How many roads are in default on their bonds?

Mr. FLETCHER. About one-third of the railroad mileage in the United States.

Senator BAILEY. How many are in the hands of a receiver?

Mr. FLETCHER. Just about that figure.

Senator BAILEY. How many?

Mr. FLETCHER. About one-third. If you are in default that almost automatically puts you in the hands of the court. The sheriff takes charge of you if you are in default, unless you can borrow the money somewhere.

Senator BAILEY. What portion of the railroads' revenue goes to railroad wages?

Mr. FLETCHER. About 47 percent.

Senator BAILEY. Practically all the other goes for supplies and material?

Mr. FLETCHER. That figure runs much higher if you add those together. I think I have those figures here, Senator. My recollection is that figure is about 23 percent, but I would have to verify that by check.

Senator BAILEY. The other is for taxes, is it?

Mr. FLETCHER. The rest of the revenue, a good deal of it—some of it goes to interest, some of it goes to taxes, a very considerable amount of it goes to taxes, about 9 percent of the whole amount goes to taxes.

Senator BYRD. At that point, what percent goes to State and local taxes and what percent goes to Federal taxes?

Mr. FLETCHER. A much greater percentage goes to State and local taxes than to Federal taxes, Senator. There is no doubt about that.

Senator BARKLEY. They all have to pay taxes on the physical property. The Federal Government does not levy such a tax.

Mr. FLETCHER. That is right. In New Jersey they pay an enormous amount of taxes on physical property.

Senator BARKLEY. There has been some recent publicity about that in the papers.

Mr. FLETCHER. Quite a bit. The leaders of the party to which you and I belong, Senator, do not seem to get along so well on that proposition.

Now, I must hurry through this statement here. I wanted to lay emphasis, however, upon the necessity, even in bad years, of spending considerable amounts for additions and betterments to the property.

Now, what are these earnings that are made now being used for? That is one thing I want to be just as clear and as emphatic about as possible. Undoubtedly the railroads in 1941 are making more money than they have made for some time, making more money

than perhaps they made since 1929 or 1930, I would say. What are they using that money for? In the first place, as I have already intimated in reply to questions from the committee, a goodly part of that sum is being expended in improving their plant, particularly the acquisition of new cars and the repair of present cars, although that does not tell the whole story. They are also spending considerable amounts in building longer sidetracks to handle the traffic they have now, and improving their yard conditions, and things of that kind. I want to say this, if I may say so without impropriety, that the railroads have not called upon the Government to bear any part of that expense.

Senator Herring, I believe, asked me about the effect of the defense program on increased earnings. In many cases plants have called upon the Government to bear part of the defense load, to do the defense work. They have arranged for the Government, properly enough I think, to take the risk. They have said, "You have asked us now to expand our plant here for the manufacture of munitions of war. We do not think we are going to need that plant after the emergency is over. That is a burden you ought not to ask us to bear"; and the Government will have to come in and furnish the money to expand the plant. I think that is fair enough. But the railroads have not asked that. They have, at their own risk and at their own expense, undertaken to expand their facilities, and particularly their supply of equipment to take care of this additional defense load, without making any arrangements with the Government to pay for that increased defense effort.

Senator BYRD. How much have the railroads borrowed from the R. F. C.?

Mr. FLETCHER. Altogether, Senator, they borrowed $810,000,000 and they paid back $345,000,000, and now they owe the R. F. C. $465,000,000. I am disregarding the thousands.

Senator BYRD. Have they borrowed from any other Government agency?

Mr. FLETCHER. Well, the P. W. A. folks had at one time, you know, gotten into the picture and loaned the railroads $200,000,000. They paid $189,000,000 of that back, and they still owe the P. W. A. $11,835,000.

Senator BARKLEY. What was that for? Elimination of dangerous crossings, building underpasses, and things of that kind?

Mr. FLETCHER. You mean the P. W. A. now, Senator Barkley?

Senator BARKLEY. Yes, the P. W. A.

Mr. FLETCHER. That money was largely for the purchase of equipment, as I recall. I have not looked it up lately, but I think that is what it was.

Senator WALSH. What interest are they paying the R. F. C.?

Mr. FLETCHER. That differs with different companies.

Senator WALSH. What is the average?

Mr. FLETCHER. My idea of the present rates—I hope I will not be accused of insincerity if I guess wrong—it is in the neighborhood of 5 percent.

Senator WALSH. Average?

Mr. FLETCHER. Average.

Senator BYRD. Some of it is as low as 3 percent, is it not?

Mr. FLETCHER. I believe there have been equipment loans at 3 percent. That is the most desirable loan from the investor's point of view that the railroad has—the equipment loan. Their loans on equipment are paid back currently by amortization.

Senator BYRD. When you said 5 percent you were speaking of the money the railroads owe the R. F. C.?

Mr. FLETCHER. Yes.

Senator BYRD. The average would be 5 percent?

Mr. FLETCHER. That would be my guess. It might be higher. I am sure it is not lower.

Senator BYRD. My impression is it is lower.

Mr. FLETCHER. I would not be so such about that. May I ask my colleagues here about that figure? Either Mr. Thomas or Mr. Ettinger would be able to answer that.

Mr. THOMAS. It is between 4 and 5 percent, but that is dependent upon certain conditions that are specified in the R. F. C. loans.

Mr. ETTINGER. The original loan started at 6 percent. It ran that way 2 or 3 years, and then, under certain conditions they made a reduction as low as 4 percent.

Mr. FLETCHER. I am going to stick to 5 percent. The R. F. C. is administered by a very careful man, you know. He applies banking principles to his transactions.

Senator BAILEY. Are the railroads able to borrow money now privately?

Mr. FLETCHER. Senator, it is almost impossible to speak of railroad credit as a mass. Some railroads can borrow money without a bit of trouble, and others could not borrow a nickel. It depends altogether on the credit of that particular railroad. Generally speaking, almost any railroad can borrow money for equipment, because those obligations are sold on a special kind of security. They have very good security, and the railroads are required, from time to time, out of earnings, to pay installments on the purchase price, which readily amortizes the debt.

The CHAIRMAN. Judge, I do not want to cut you off at all.

Mr. FLETCHER. I know, Senator.

The CHAIRMAN. We have several other witnesses here today.

Mr. FLETCHER. I am sorry. I will try to hurry through. I was going to say if this 10 percent could be saved much of the money would be paid back to the Government. These railroads are anxious to discharge this debt to the R. F. C. It is not a pleasant thing to owe the Government.

Senator BARKLEY. It would not go to the Treasury, though, would it? It would go to the increased income on the part of the Government agency?

Mr. FLETCHER. It could be made available for loans or any use the R. F. C. wanted to make of it, Senator. I want to say in that connection, I know of two important railroads that have recently been able to discharge their obligations to the R. F. C. by borrowing from private sources.

Senator VANDENBERG. It would also save the Treasury something if you never paid back your loan.

Mr. FLETCHER. I should think so. I think the R. F. C. is going to collect practically all the money. They made a lot of money in

profit on the railroad loans. In other words, they loaned the railroads money and took their notes, bonds, and the like, and sold them at a premium now and then. It is a self-liquidating proposition with the R. F. C. The expenses do not come out of the Treasury, they come out of the profits.

Senator BAILEY. They made a profit of $200,000,000.

Mr. FLETCHER. Yes; that is right. I want to say on this particular point, however, that the railroads do pay a very considerable amount of taxes. Their tax bills amount to over a million dollars a day. I have a statement here that shows what their taxes were for 10 years, and they were in excess of their net income.

Senator BYRD. This is true, is it not, Mr. Fletcher, that if the railroads were not able to pay taxes it would disorganize the tax system of practically every State in the Union, and in every county and in every city?

Mr. FLETCHER. If the railroads stopped paying taxes, it would disorganize the tax system and you would have to close the schools in a great many parts of the country.

Senator BYRD. Nothing could be more serious to the tax system of the States. I believe we who have studied that know that if something happened to the railroads that they could not pay taxes there is nothing that could be more serious to the tax systems of the States and local communities.

Mr. FLETCHER. We have lots of figures on that. We contribute so much to the schools, especially the rural schools, that it would be disastrous if the railroads ceased to be taxpayers. It is true, as you suggested I think, Senator Barkley, that the greater part of the taxes goes to the States, being based on the physical properties of the railroads.

Well, that is our story, Mr. Chairman, on the subject of the 10 percent tax.

Senator VANDENBERG. Mr. Fletcher, let me ask you one question at that point. Let us admit, for the sake of the argument, that it would be unfair to the railroads to penalize them by an extra 10 percent when they chose the invested capital method. Let us admit that for the sake of the argument.

Mr. FLETCHER. Yes.

Senator VANDENBERG. Then let us admit that there are some of our corporations which obviously do not carry their equitable share of the taxes when they choose the invested capital method. Could you suggest any formula by which you could reach one and exempt the other?

Mr. FLETCHER. I could not, Senator. If I did have such a formula I would hesitate, if you will pardon me, to suggest it. It would be a little more than the average witness can assume to say, "I want to be exempted from taxes, but here is a fellow over here that you ought to put them on to." I do not think that would be quite right for me to do.

Senator VANDENBERG. Well, we have the two sets of facts. The 10 percent tax clearly is unfair in one instance, and it is clearly justified in another. I am wondering if there is a middle ground?

Mr. FLETCHER. I had not known, Senator, until you just stated it, that that 10 percent would be clearly justified in some cases. I do not

question your statement, but I do not have the information. I do not know how to answer that question.

Senator VANDENBERG. I am not sure that there is an answer.

Mr. FLETCHER. I am not sure, either.

Senator, I have some other points that I would like to make about amendments to the revenue act as it stands now. Would it be permissible if I address a letter to the committee and make those suggestions in writing and have them incorporated in my testimony so that the committee might see it?

The CHAIRMAN. Yes.

Mr. FLETCHER. I appreciate the fact that I have used all the time that your indulgence would permit.

The CHAIRMAN. Yes; that would be all right. Furnish it to the clerk of the committee and it will be incorporated in the record.

Mr. FLETCHER. I have a few suggestions that are important, looking toward the amendment of the revenue code as it stands now.

In concluding what I have to say with respect to the injustice of the special 10 percent excess-profits tax as applied to railroads, I offer the observation that if this tax is retained at all in the act, corporations with poor earnings in the base period and with large capital investments should, in any event, be relieved from paying the 10 percent tax, if their taxable income is less than some fair percentage on the invested capital. It would be difficult to justify imposing this special tax if the return was no more than 6 percent upon the invested capital. In the Transportation Act of 1920, railroads were permitted to earn under the plan set up in the act at least 5¾ percent upon the value of property. The invested capital base carried in the act is less than the value of the property.

I suggest, therefore, that even if this 10 percent tax is retained in any form, there should be a further provision that it should not apply so as to tax earnings which are below the figure of 6 percent upon the invested capital. Perhaps this might be accomplished by adding after the figure "713" in the nineteenth line on page 16 of the bill as it came from the House the words "or with the use of a credit of 6 percent of invested capital determined under section 715, whichever is the larger, exceeds, and so forth.

Earlier in my testimony I made reference, briefly and incidentally, to some objections to the provisions in the House bill which do not permit deduction of the income tax from the excess profits net income subject to excess profits tax. The present law permits the deduction of income tax before excess profits tax is calculated. The House bill reverses this process and does not permit the deduction of income tax from excess profits income, but permits the deduction of excess-profits tax from the normal income-tax base. We think this is an illogical conclusion. Excess profits should not be assessed until after the income tax has been paid. As the House committee report points out, the effect of a provision which does not allow the deduction of income tax from the excess-profits income, in effect, reduces the rate of credit from 7 percent to 4.9 percent. Some of the difficulty would be avoided if the Senate committee would retain the provision of the present law, permitting the deduction of income tax before the excess-profits tax is calculated.

I desire to say a word on behalf of two railroads, to wit: the Baltimore & Ohio and the Lehigh Valley, that have taken advantage

of the Chandler Act, which permits certain railroads, with the consent of the Interstate Commerce Commission and the court, to defer payment of certain interest, provided an overwhelming majority of the security owners consent. Under this Chandler Act, these railroads have escaped bankruptcy, not by repudiating or reducing their obligations, but by deferring them. Under the terms of the decree of the court approving the agreed arrangements, currently and annually a considerable amount of net income must be set aside for payments to sinking funds, capital funds, and deferred interest payments, with the result that in the year 1941 and in subsequent years there will be very little net income which these railroads can devote to any purposes except taking care of these sinking funds, capital fund, and contingent interest charges. Special consideration should be given to the situation of railroads in this class.

Another situation is worth mentioning and this situation involves not a change in the law now under consideration but some amendment to the act of March 7, 1941, making certain amendments to the provisions of the law dealing with excess profits. The suggestion I am about to make applies particularly to railroads in New England that suffered a great loss of revenue by reason of unusual storms and floods in the year 1938. The railroads were washed out, traffic had to be routed through circuitous and expensive routes, railroad bridges had to be rebuilt and a great deal of expense incurred, in an extraordinary measure affecting revenues in the base period. As a result of these expenses, the base period earnings were greatly reduced and if the special 10 percent excess profits feature is to be retained, it would work with peculiar hardship upon these lines.

The 1941 amendments to the Excess Profits Tax Act provided in section 722 that a taxpayer within 6 months following the filing of its return may apply to the Commissioner for relief by way of a readjustment of its average base period net income in the following circumstances:

SEC. 722. Adjustment of abnormal base period net income.

(a) *General rule.*—In the case of a taxpayer whose first taxable year under this subchapter begins in 1940, if the taxpayer is established—

(1) That the character of the business engaged in by the taxpayer as of January 1, 1940, is different from the character of the business engaged in during one or more of the taxable years in its base period (as defined in sec. 713 (b) (1)); or

(2) That in one or more of the taxable years in such base period normal production, output, or operation was interrupted or diminished because of the occurrence of events abnormal in the case of such taxpayer; and

(3) The amount that would have been its average base period net income—

(A) If the character of the business as of January 1, 1940, had been the same during each of the taxable years of such base period; and

(B) If none of the abnormal events referred to in paragraph (2) had occurred; and

(C) If in each of such taxable years none of the items of gross income had been abnormally large, and none of the items of deductions had been abnormally small; and

The amendment further provided—

(b) *Rules for application of subsection* (a).—For the purposes of subsection (a)—

(1) High prices of materials, labor, capital, or any other agent of production, low selling price of the product of the taxpayer, or low physical volume of sales owing to low demand for such product or for the output of the taxpayer, shall not be considered as abnormal.

(2) The character of the business engaged in by the taxpayer as of January 1, 1940, shall be considered different from the character of the business engaged in during one or more of the taxable years in its base period only if—

(A) There is a difference in the products or services furnished; or

(B) There is a difference in the capacity for production or operation; or

(C) There is a difference in the ratio of nonborrowed capital to total capital; or

(D) The taxpayer was in existence during only part of its base period; or

(E) The taxpayer acquired, before January 1, 1940, all or part of the assets of a competitor, with the result that the competition of such competitor was eliminated or diminished.

The foregoing appears to make no provision for any adjustment on account of rehabilitation of property damaged or destroyed by casualty, unless it can be shown under paragraph (a) (2), that "normal production, output, or operation was interrupted or diminished because of the occurrence of events abnormal in the case of such taxpayer." The difficulty with this language read in connection with that quoted above from section 722 (b) is that the emphasis is on disturbance of production and not on increase in expenses. This might not meet the situation of a railroad whose maintenance expenses had been substantially increased by a casualty but had been able through rerouting or otherwise to handle its traffic. This difficulty might be met if after the words "production, output or operation was interrupted or diminished" were inserted the words "or expenses increased."

In section 23 of the Internal Revenue Code among the deductions allowed from gross income is the following:

(f) *Losses by corporations.*—In the case of a corporation, losses sustained during the taxable year and not compensated for by insurance or otherwise.

In section 711 it is provided that in determining the income for the base period:

(E) *Casualty, demolition, and similar losses.*—Deductions under section 23 (f) for losses arising from fires, storms, shipwreck, or other casualty, or from theft, or arising from the demolition, abandonment, or loss of useful value of property, not compensated for by insurance or otherwise, shall not be allowed;

This provision, however, does not militate against the suggestion that deductions should be allowed for losses occasioned by abnormal events. We are not dealing with allowances on account of property damaged or destroyed, but with abnormal charges to maintenance account as to which there would ordinarily be no occasion for any special allowance. There should, however, be a clear provision that in determining the net income in the base period special allowance should be made for the effect of abnormal events on expenses as well as on income.

One other matter contained in the present Revenue Code deserves attention. I refer to the familiar fact that taxpayers are often called upon to execute agreements to extend the statute of limitations beyond the period named in the statute, if the statutory period does not permit the adjustment of controverted questions within the 3 years provided.

The statute of limitations with respect to the assessment of deficiencies is now the same as in the case of refunds; to wit, 3 years. However, it is frequently necessary for taxpayers to agree to waive the limitation provisions with respect to deficiencies in order that their returns may be adequately investigated and their claims con-

sidered. This will happen more frequently when excess profits-tax returns, involving many moot questions, valuation problems, and so forth, are under review.

Such waivers or extensions of statutory period should be mutual as frequently (especially when several years are involved and interrelated problems have arisen) it is impossible to know in advance whether the result for any particular year will be a refund or a deficiency. Often the net result for several years will be a deficiency, though the final determination for one of those years will indicate a refund due.

Unless a taxpayer is properly advised by Treasury representatives or others, the statute may bar a refund which may not have been anticipated when an extension of time was agreed to with respect to deficiencies.

Despite the foregoing, the Treasury cannot make a two-way agreement. This situation often leads to either a summary determination not properly considered, the filing of many wholly unfounded but "right protecting" claims for refund or to unjustifiable losses by taxpayers, few of whom can be well informed of the intricacies of the finer points of tax procedure.

It is therefore recommended that the Code be amended to provide that upon the execution of any valid extension of the statute of limitations with respect to deficiencies, the period for the timely filing of refund claims be similarly extended automatically.

There is another subject that I would like to discuss briefly, which does not arise out of any provision of the proposed bill, but rather out of the provisions of the present law. This is the adjustment for inadmissible assets that must be made in determining the amount of invested capital. Section 720 of the Internal Revenue Code, as amended, gives the following definition of the term "inadmissible assets":

> (A) Stock in corporations except stock in a foreign personal holding company, and except stock which is not a capital asset; and
>
> (B) Except as provided in subsection (d), obligations described in section 22 (b) (4) any part of the interest from which is excludible from gross income or allowable as a credit against net income.

The term "admissible assets" means all assets other than inadmissible assets.

Under the further provision of section 720, the average invested capital for any taxable year must be reduced by an amount which is the same percentage of the average invested capital as the percentage which the total of the inadmissible assets is of the total of admissible and inadmissible assets. This rule is, however, subject to the further provision of section 720, paragraph (d), which lays down the rule that if the excess profits credit for any taxable year is computed under section 714 (invested capital basis) the taxpayer may in its return for such year elect to increase its normal-tax net income for such taxable year by an amount equal to the amount of the interest on all obligations held during the taxable year which are described in section 22 (b) (4) any part of the interest from which is excludible from gross income or allowable as a credit against net income. In other words, the taxpayer may elect, at its option, to include in normal-tax net income the amount of the interest received on Government obligations, State or Federal, and if it does so, the investment in such obli-

gations may be treated as an admissible asset and included in the invested capital credit. No such election is permitted, however, with respect to stocks in other corporations (except stock in a foreign personal holding company) and the investment in such stocks must be treated under the present provisions of the law as inadmissible assets in any event.

The failure to allow any option with respect to stocks and the dividends received therefrom works a particular hardship and injustice on many railroads which, pursuant to the consolidation provisions of the Transportation Act of 1920, made substantial investments (less than 95 percent) in stocks of other carriers for the purpose of ultimately acquiring control thereof under orders issued by the Interstate Commerce Commission. While these acquisitions were in a sense voluntary, Congress had laid down the policy that the consolidation of all the railroad properties of the United States into a limited number of systems was in the public interest. Under the act, the Commission was instructed to issue an order, approving and authorizing the acquisition of control by one carrier in another, only if, after hearing, it found that such acquisition was just and reasonable and would be in harmony with, and in furtherance of, the plan for the consolidation of railway properties previously mentioned and would promote the public interest. Accordingly, after passage of the Transportation Act of 1920, wherever a railroad acquired a stock interest in another carrier as a step toward control of such carrier, it did so only pursuant to a finding of the Interstate Commerce Commission that such acquisition was in the public interest and in accordance with the aforesaid plan of consolidation.

In practically all instances of this sort the railroad that acquired stocks of another carrier has had little, if any, return in the way of dividends from the stocks purchased. Indeed, the stocks were not purchased as an investment, but rather to carry out the policy of consolidations that had been adopted by Congress.

Therefore, in all fairness, the present law should be amended to give the taxpayer an option with respect to stocks and dividends thereon in the same manner as the option is given with respect to Government securities under section 720 (d).

For a long time the railroads have been burdened, we think unfairly, by the inability to include in consolidated returns lessor railroad corporations belonging to an affiliated group where the stock ownership is less than 95 percent. The property of these lessor companies is operated by railroad lessees, with an obligation in the lease contract under which the income tax of the lessor is paid by the lessee.

The statute in its present form recognizes the propriety, in view of the peculiar situation of the railroads, of dealing with railroad systems as economic units, where substantially all the stock of the constituent companies is owned within the affiliated group. The proposed amendment would extent the privilege of consolidated returns to situations in which it would appear that such privilege is eminently warranted.

Many of our railroad systems include roads that were leased by the proprietary companies for long terms of years. The leased line

is operated as part of the railroad system, just as any operating division, whether owned or leased, and is usually part of a through route. The moneys out of which the rental is paid to the lessor come from the operation of the integrated economic unit which constitutes the parent of lessee carrier. These leases, for the most part, were concluded a generation or more ago, during times when income taxes, at least on the current scale, undoubtedly were not in contemplation. These leases usually provide for rental measured by interest on bonded indebtedness of the lessor and dividends on its capital stock. Some of these leases also provide that the lessee shall pay taxes imposed not only on the leased premises but also on the rentals.

In such cases the lessee is under obligation not only to pay the stipulated rental but, as well, any income tax imposed on the lessor based on the rental income. It thus transpires that although the income tax is measured by the income of the lessor, it is not payable by such lessor or its security holders but by the lessee by virtue of its tax-assumption covenant. The rate or amount of income tax is a matter of complete indifference to the lessor. In truth and substance, the tax is imposed on the lessee. Under the law in its present form, it has transpired that operating railroad companies which have earned no net income and have suffered deficits have nevertheless been required to pay income taxes computed on the rentals which they paid to their lessors; indeed, they have been required to pay pyramided income taxes on the amount of income taxes of the lessors. In these circumstances, it would appear abundantly proper that there should be the privilege of a consolidated return so that there may be no inequity of assessment and so that, being an income tax payable by the lessee, it may be measured by the consolidated net income, if there be any, of both lessor and lessee.

We think the point we are urging would be accomplished by adding a paragraph to the present law in the appropriate place which would provide:

Any corporation (less than 95 per centum of the stock of which is owned by one or more of the other corporations in the affiliated group) may, at the option of the lessee hereinafter referred to, also be included in the affiliated group if it is a common carrier by railroad and its railroad properties are leased to the common parent corporation or another member of the affiliated group under a lease whereby the income taxes of the lessor are an obligation of the lessee: *Provided however*, That any corporation so included in the affiliated group shall not be liable for any tax in excess of the liability that would exist on its part if it had filed a separate return.

I thank the committee most sincerely for its patient attention.

The CHAIRMAN. There are two other witnesses here on the same question. Mr. Stowell, if it is agreeable, we will call you first.

STATEMENT OF L. C. STOWELL, NEW YORK, N. Y., REPRESENTING OFFICE EQUIPMENT MANUFACTURERS INSTITUTE

Mr. STOWELL. Mr. Chairman and members of the committee, my name is L. C. Stowell. I am here on behalf of the makers of business and store machines, and particularly the thousands of purchasers of this equipment who must bear the 10 percent excise tax on business and store machines proposed in the bill now before you.

Let me say at the outset that the Treasury Department did not recommend a tax on these machines, nor did any representative of the users and makers of these machines have an opportunity to appear before the House committee with respect to such a tax. This proposed excise tax of 10 percent on business and store machines was added to the bill after the close of the public hearings before the House Ways and Means Committee. For your convenience, there is inserted in the record, as a part of this statement, a list of articles on which excise taxes were recommended by the Treasury Department.

Beginning on page 65 of the bill and continuing on page 66, there will be found a list of 54 types of business and store machines upon which the tax is to be imposed. Various types of these machines are used in all kinds of businesses. They are used by Government, the lawyer, the manufacturer, those engaged on defense contracts for the Government, in your own offices, by the merchant, and even by the bootblack. You will find some of them in small hardware stores, groceries, bakeries, restaurants, barber shops, small manufacturing plants, and every retail establishment in the States you represent, as well as in each school, college, and hospital located within your State. In fact, as you know, there is hardly a single small enterprise in the country that does not use one or more of these machines. All of these users and others in the same category are potential purchasers.

These business and store machines are the "machinery of management," just as machine tools are the machinery of production. The machinery of management must be obtained and used before the machinery of production can be obtained and put into use, as well as all during the time the machinery of production is operating. For example, one of the world's largest plants for the manufacture of aeroplane motors, the Wright Aeronautical Corporation, rose like a mushroom. Before a spade full of earth was turned, however, management set up temporary quarters and installed temporary office equipment to provide vital control. There, as huge orders were placed for production machinery, some of the largest orders ever written for office equipment were placed at the same time. This is proof, indeed, that however fine its production machinery might be, this great plant could not operate or even prepare to operate without equally modern machinery of management.

These machines, the machinery of management, are the tools of business, small and large, standing equally in that regard with all other types of tools. They bear the same relationship to business that machine tools do to factories, that farm machinery does to the farmer, or the hammer and saw to the carpenter, or the plumber's tools to the plumber. There is no more reason for taxing these machines than there is for placing a tax on the tools of labor.

THE TAX AND THE NATIONAL DEFENSE PROGRAM

William L. Batt, of the Office of Production Management, as reported in the press recently, said:

> Many folks might scoff at the idea that the typewriter was an engine of war, but I submit that in the language of total war the typewriter, according to its proper meaning, is indeed in a sense an engine of war, for what sort

of a defense program could we conduct without typewriters? All of the paper work in defense industries would have to be laboriously done by hand. We would need several times the amount of paper and employees for clerical work. That would mean diversion of labor from other fields and a huge extension of the paper industry with all its implications in terms of economic dislocation.

He argued that typewriter production must increase because, obviously, with an increase of 25 or 30 percent in our national income we are going to need more typewriters for industry to function efficiently. The same applies to the entire list of business and store machines.

A trip through any of the numerous Government departments in Washington or elsewhere, or any business establishment, will give an adequate picture of the importance of office machines today. It is not too broad a statement to say that the United States Government could not be run without modern office machines. It will be obvious to anyone making a study of the situation that office machines should not be selected as a separate and distinct group to be the subject of taxation when the tools of production, agriculture, and defense are not taxed. The release of manpower arising from the use of office machines alone makes the contribution of office equipment to the national-defense program unique. This saving should be encouraged in every possible way and not discouraged by adding a substantial tax to its cost.

A representative of this industry has recently been called to Washington by the Priorities Division of the Office of Production Management to discuss the application of the A–10 preference rating plan to all those companies which need it. The officials of the Priorities Division of the Office of Production Management have become convinced that dynamic office equipment needs the assistance of a preference rating. These officials define as "dynamic office equipment" the exact machines which are listed in the tax bill.

The Priorities Division of the Quartermaster Department of the United States Army has recently requested that "business machines—all types" be placed on the critical list of items needed in the national-defense program.

These actions on the part of the Office of Production Management and the Quartermaster Department of the United States Army indicate clearly the vital importance of these products to all Government activities, business activities, and the national defense.

We believe this proposed tax is uneconomic. A 10 percent tax will fall with particular weight on the small retailer, businessman, and individual employer, because he must have modern business and store equipment, and the cost of it looms larger in proportion than in the larger business establishments. Numerically the small business men would be by far the largest payers of the tax.

Business machines are tools in the use of which over 2,000,000 people earn their living. No other tools with which people earn a living are being taxed.

We also believe there is a misunderstanding as to the amount of taxes to be collected.

Public announcements have given the estimated tax collections on business and store machines of $21,000,000. Conservative estimates of experienced men in the industry, with many facts to support their judgment, estimate that the tax collections will be $7,500,000, and to

the extent that the national-defense program requires increasing amounts of office equipment that total will be reduced.

Approximately 50 percent of all office machines being made today are going directly to immediate defense agencies of the United States Government and the direct defense industries, on which purchases no tax would be collected. This amount is growing rapidly.

A study of a cross section of the office equipment industry shows that taking 1938 as a base, the sales to the United States Government have increased 2½ times already, and will be above the 300 percent mark soon.

It is estimated conservatively by some of the companies in the office-equipment group that 70 percent of their total production will soon be going into either one of these two channels—namely, direct to the United States Government or to the defense industries on Government requisition, both of which would be nontaxable. Furthermore, where the equipment is not purchased on Government requisition, and is used in defense work, there will be no net tax, since the increased cost will be reflected in the cost of the goods manufactured.

Let me summarize:

1. This tax is discriminatory because these are the only tools, with which people earn their living, which it is proposed to tax.

2. Numerically it will fall heaviest on the many small businessmen, who are least able to bear it.

3. It will not produce the revenue estimated.

4. The tools of management are as important as the tools of production to national defense.

In conclusion, we feel strongly that this is an ill-advised tax as we have pointed out both from the standpoint of Government and small business. It must be remembered that this tax is not borne by the manufacturer but by the purchaser.

May I quote a statement made by a representative of the Treasury Department before the Ways and Means Committee of the House of Representatives, as follows:

> In the field of excise taxation, it is proposed that a number of new taxes be imposed and the rates of some existing taxes be increased. We have endeavored to avoid excises which would fall on the basic necessities of life and excises which, while productive, would constitute an increase in the cost of doing business and thus would be passed on to the Government and to the public in general price increases. We have, however, selected certain luxury articles which, though widely used, are not necessities.

The tax proposed is a direct violation of this principle.

We respectfully request your committee to eliminate this tax on business and store machines.

EXHIBIT A.—*Recommendations of the Treasury Department with reference to excise taxes*

Tobacco:
- Cigarettes: Additional 75 cents per 1,000.
- Cigars, tobacco, and snuff: Double rates.

Liquor:
- Distilled spirits: $1 per gallon additional.
- Fermented malt liquors: $1 per barrel additional.
- Wines, cordials, and liqueurs: Increase of 16⅔ percent.

Other excise taxes:
- Gasoline: 1 cent per gallon additional.
- Soft drinks: 1 cent a bottle and equivalents.
- Passenger automobiles, parts, and accessories: double rates.

Check tax: 2 cents per check.
Admissions: Reduce exemptions from 20 to 9 cents.
Tires and tubes: Increase rates from 2½ and 4½ to 5 and 9 cents.
Telephone, telegraph, cable, etc.: Lower exemptions and increase rates.
Passenger transportation: 5 percent of amount paid (35 cents exemption).
Telephone bill: 5 percent.
Furs: 10 percent of retail-sale price.
Jewelry: 10 percent of retail-sale price (1932 act exemption).
Matches: 2 cents per 1,000.
Radio sets and parts: Increase rate from 5½ to 10 percent.
Toilet preparations: Revise basis.
Trunks, suitcases and other luggage: 10 percent.
Phonographs and phonograph records: 10 percent.
Candy, chewing gum: 5 percent.
Musical instruments: 10 percent.
Bowling alleys: $15 per alley, billiard or pool table.
Club dues, initiation fees: Lower exemptions and redefine base.
Playing cards: Increase rate from 11 to 15 cents.
Safe deposit boxes: Increase from 11 to 20 percent.
Cabarets: 4 percent of total charge.
Photographic apparatus, etc.: 10 per cent.
Clocks, watches, etc.: 10 percent.
Mechanical refrigerators: Increase rate from 5½ to 10 percent.
Sporting goods: 10 percent.

Senator VANDENBERG. Mr. Stowell, what would you say to substituting a small general manufacturers' tax for all of these special excise taxes?

Mr. STOWELL. Senator, I am afraid I am not a tax expert, but it seems to me if there is going to be a sales tax or a manufacturers' tax it should be on everything.

Senator VANDENBERG. I agree with you.

Senator WALSH. Is there a great variety in the price of these machines?

Mr. STOWELL. Yes, sir; a very great variety. The typewriter sells for $115.50 and the highest priced bookkeeping machine probably for $2,500, and there is every range between those two.

Senator WALSH. There would be a tax of $250?

Mr. STOWELL. That is correct.

Senator BAILEY. Can you tell me to what extent our Federal Government and the State governments rent these business machines rather than purchase them?

Mr. STOWELL. Yes; there are various types of machines that are leased, tabulating equipment, and so forth.

Senator BAILEY. That is one machine that the Government leases. It is not allowed to buy that.

Mr. STOWELL. There are certain other types of machines that are leased, the tabulating machines being the principal product of all.

Senator BAILEY. The State of North Carolina leases a great many tabulating machines.

Mr. STOWELL. And business machines, too.

Senator BAILEY. This applies only to machines sold?

Mr. STOWELL. My personal interpretation of the act is it applies to both.

Senator BAILEY. I notice in the title here, the introductory language, it says "sold."

The CHAIRMAN. Pardon me, Senator. My understanding is that a sale is, in the regulations, interpreted to mean lease. It covers leases as well as sales.

Senator BAILEY. I was going on the language in line 4, the word "sold." Of course, it could be construed that you sell it on time, and that is a lease.

Mr. STOWELL. I think there is general language, either in the back of the bill or the front part of it, which covers that, but I am not certain.

Senator BYRD. What do the Treasury experts say to that? Does it include leased?

Mr. WRAY. I believe the sale there is defined to include certain types of leases.

The CHAIRMAN. The sales to the States are not taxed?

Mr. STOWELL. They are not taxed.

The CHAIRMAN. Nor the leases to the States?

Mr. STOWELL. No; I believe that goes to States, subdivisions thereof, and municipalities.

The CHAIRMAN. Yes; this tax law was recommended by the Defense Committee, was it not?

Mr. STOWELL. I am not sure. Mr. Leon Henderson appeared before the Ways and Means Committee and expounded a theory of cutting down on the use of office equipment. I do not know that he mentioned office equipment, I know he mentioned automobiles. That was on the theory that if you tax them the people will buy less and there will be more of the raw materials going into those machines available for defense.

The CHAIRMAN. Yes; I think it came from Mr. Henderson. He made the recommendations. He supplied a list subsequent which included the store machines.

Mr. STOWELL. Actually, Mr. Chairman, the office-equipment industry uses very little material when compared to the total material of the country. I made an estimate the other day. I will admit it is purely an estimate, but my estimate is we use about one-twentieth of 1 percent of the steel of the country, which of course is nothing in the main program. Labor is the big thing that goes into office equipment.

Senator BARKLEY. How many concerns are there manufacturing office equipment?

Mr. STOWELL. There are 35 concerns that are members of the Office Equipment Manufacturers Institute. It depends on how you define office equipment, but probably there may be 15 others. Most of the concerns, however, the important ones, are in the 35 group.

Senator BARKLEY. Are there one or two of the 35 who are members of your association that do a large amount of business?

Mr. STOWELL. A number of companies do a large business. There is no one company that dominates the field, if that was the import of your question.

Senator LA FOLLETTE. Mr. Stowell, could you furnish for the record an amplification of your contention that it will not yield the revenue estimated?

Mr. STOWELL. I will be very glad to do that.

Senator DANAHER. Mr. Chairman, a question.

The CHAIRMAN. Yes.

Senator DANAHER. Did you happen to see the United States News for August 8, 1941, in which it depicted the tools of defense?

Mr. STOWELL. Yes; I did.

Senator DANAHER. In 1939, Mr. Chairman, the record, as reported by the United States News, shows a total purchase of $24,000,000 by the Government of machines for office equipment. In 1940, $35,000,000; and in 1941, $100,000,000. The Government's use is so great, in the article that appeared in the United States News issue of August 8, 1941, the matter is so important, that I would ask that the balance of the article be introduced in the record, unless there is some objection.

The CHAIRMAN. It may be inserted.

(The article referred to is as follows:)

[From the United States News, August 8, 1941]

TOOLS OF DEFENSE

Increasing Government Purchases of Office Equipment

(1939, $24,000,000; 1940, $35,000,000; 1941, $100,000,000)

Behind the grim front-line machines of modern war are peaceful-looking office machines which handle a vast amount of paper work for the Army and Navy. The click and whirr of typewriters and tabulating machines at military headquarters are as much a part of machine-age fighting as the scream of dive bombers and the rumble of tanks in the front lines.

In fact, William L. Batt, Deputy Director of Production, of the Office of Production Management, says the typewriter in total warfare has become an engine of war. Without machines for its office tasks, the Army would get snarled in its paper work. Then large-scale organization for total war would be impossible.

Mechanization of paper work is keeping step with use of machines for land, air, and sea fighting. As the pictogram shows, Government purchases of office machinery have increased tremendously under the national-defense program.

Trade authorities estimate direct Government purchases of office machines this year will approximate $100,000,000, or one-third of all office-machine sales. Directly or indirectly, defense may account for three-fourths of this year's estimated $300,000,000 office-machine sales. Previously, Government purchases took about one-sixth of the industry's output.

Army purchases of office machinery in the fiscal year ended last June 30 jumped to around $6,500,000, compared with $565,000 in the previous year. For an Army of 1,500,000 men, more than 50,000 typewriters alone had to be acquired.

Defense purchases of office machines were added to the Government's usual large requirements. Even in peacetime, the United States Government is the greatest single buyer of office machines in the world. Uncle Sam's office force of more than 500,000 clerical workers uses thousands of typewriters, adding and addressing machines, and mimeographs. Much tabulating machinery of advanced types had to be installed for the New Deal ventures in social security, public works, crop control and other undertakings involving big-scale accounting.

Now the increasing scope of Government activity for war accelerates the shift of machines in the office as well as in the field. Most of this machinery has been developed since the World War. In the 1914–18 conflict office machinery meant chiefly such mechanical aids as the typewriter. The main record-keeping jobs were done by hand.

Now tabulating machinery is specially designed for the huge accounting tasks of Government and military organizations. The Adjutant General's office in the War Department, profiting by the experience of private business, is using machinery in handling the records of individual soldiers.

Keeping tab on the movements of 1,500,000 men in itself is a heroic task of record filing and sorting. Tabulating machines have solved this problem for the Army. Electrically operated machines sort and classify cards which record the endless changes in the Army's manpower. Office machines likewise have lightened the task of the Quartermaster Department in keeping up-to-date inventories of thousands of items of supplies.

Senator DANAHER. I would like to ask the witness one other question. On page 63 of the bill let me read lines 3, 4, and 5:

> There shall be imposed on the following articles, sold by the manufacturer, producer, or importer, a tax equivalent to the rate, on the price for which sold * * *.

Then it includes this business equipment. Is there any undue advantage given to a manufacturer under that language provided he sells through direct outlets rather than through jobbers and distributors?

Mr. STOWELL. No, sir. He will collect the tax if he does not sell it. I am expressing only a personal opinion. The industry is divided on that. There are companies in the industry that sell through dealers, and all the companies, practically speaking, sell through dealers in some of the smaller points in the country districts. I assume that the dealer will collect the tax in that case, and there are a great many office equipment dealers throughout the country.

Senator DANAHER. If a manufacturer sold directly, through, would he not be able to sell at a great deal less, by virtue of the fact that he is selling through his own organization rather than through distributors?

Mr. STOWELL. There are some economies. On the other hand, manufacturers cannot afford to have their own distributing point in some districts, because they would only be distributing their own product, and in a country district a man may distribute typewriters, adding machines, store machines, and other things all in one store and I would say he would collect the taxes. The manufacturer would only collect the taxes when he would sell direct to the consumer himself. That is my interpretation of the law.

Senator DANAHER. Under section 3441 of the Internal Revenue Code, there is provided a method for determining the sales price. It says, and I quote the pertinent portion:

> If an article is sold otherwise than through an arm's-length transaction at less than the fair market price the tax under this chapter shall, if based on the price for which the article is sold, be computed on the price for which such article was sold in the ordinary course of trade by manufacturers or producers thereof as determined by the Commissioner.

Do you know of any difficulty in the administration of that particular provision which gives the Commissioner the right to set up the price for which the manufacturer sells?

Mr. STOWELL. I do not know of any, because within the confiines of the United States the companies that sell direct, or sell a portion of their product direct, would sell, roughly, at the same price at which the dealer would sell. We do not compete with the dealer. It is not a matter of the dealer selling one of the machines, in my view, and we are selling in the same district with him. If we have an office we do the selling. We have an office in Washington, there is no dealer in Washington. In Hagerstown we have a dealer, perhaps. We do not deal with anybody else in the District. He is the representative of our company.

You have to render service on these things, too, and we have to all have a very large service organization, and that means you have got to have a substantial establishment.

Of course, another point which I did not make in my brief is the matter of export sales. Export sales would not be taxable. Our

export business, as you gentlemen know, has shrunk, but we still do more business than the general public thinks we do. The investing public thinks the export business has gone overboard completely. It has not. It has not; it is much less than it was before the hostilities in Europe. There is no tax collected on that business, at least if I am correct in my statement.

Senator BYRD. What percent of the export business do you have now as compared to normal times?

Mr. STOWELL. In normal times our own company had 30 percent, Senator, outside the confines of the United States.

Senator BYRD. What has that shrunk?

Mr. STOWELL. That has shrunk two-thirds.

Senator BYRD. What is the percentage for the industry as compared to before the war?

Mr. STOWELL. It is two-thirds to one-third. That would be about 15—between 10 and 15 percent, probably. That varies for different companies, of course. My own company, however, in normal times exported one-third of their product outside the continental United States.

Senator BYRD. Now you export about 10 percent?

Mr. STOWELL. Yes. It varies between 10 and 15 percent sometimes.

The CHAIRMAN. Any further questions?

Mr. STOWELL. Thank you very much, gentlemen.

The CHAIRMAN. Thank you for your appearance.

(Mr. Stowell submitted the following letter for the record:)

UNDERWOOD ELLIOTT FISHER CO.,
New York, August 15, 1941.

Hon. WALTER F. GEORGE,
United States Senate,
Washington, D. C.

DEAR SENATOR GEORGE: As you suggested in our conversation after I had appeared on Wednesday, August 13, before the Senate Finance Committee on behalf of the Office Equipment Manufacturers Institute in opposing the proposed 10 percent manufacturers excise tax on business and store machines, I am submitting to you an explanation of a paragraph of my statement before the Senate Finance Committee which reads as follows:

"Public announcements have given the estimated tax collections on business and store machines of $21,000,000. Conservative estimates of experienced men in the industry with many facts to support their judgment estimate that the tax collections will be $7,500,000 and to the extent that the national-defense program requires increasing amounts of office equipment, that total will be reduced."

The Office Equipment Manufacturers Institute is in possession of data from 24 of its present 34 member companies, the 24 companies representing all of the larger companies in the membership of the Institute with but one exception. This data makes it possible to give the following reasonably accurate estimate. Total estimated volume of sales of the items listed in the tax bill.

1941, at retail	$176,000,000
Sales to Government, Federal, State, county, municipal (not subject to tax)	100,000,000
Total	76,000,000
Possible tax	7,600,000

Figures were submitted during July by the Secretary of the Institute, Mr. E. D. Taylor, which were used in a letter which was addressed to the Honorable Colin F. Stam, of the Joint Committee on Internal Revenue. These figures showed a possible tax of $4,500,000. The reason for the difference in our present estimate of $7,600,000 and the $4,500,000 estimate mentioned just above is as follows:

On arriving at the $4,500,000 estimate, 40 percent was deducted from the $76,000,000 figure in the above table to arrive at a so-called manufacturers price upon which to base the tax. Because we are not certain what basis might finally be allowed for computing the manufacturers price and, further, because we wished to make our statement before your committee a very conservative one, we have disregarded this item completely and have used a round figure of $7,500,000.

I trust the above information will be satisfactory to you. If there are any other questions you may wish to have answered, I will be happy to supply you with the needed information.

I wish to emphasize again our strong belief that the proposal to tax business and store machines should be eliminated entirely from the bill by the Senate Finance Committee and your assistance toward accomplishing that end will be sincerely appreciated.

Sincerely yours,

L. C. STOWELL.

(The following letters relating to the proposed new manufacturers' excise taxes (sec. 522), as applying to "(6) Business and store machines," are typical of many received by the Senate Committee on Finance. The other letters of this nature are on file and have been brought to the attention of the committee.)

BAUMANN WHOLESALE DRUG CO.,
Shreveport, La., August 21, 1941.

THE SENATE FINANCE COMMITTEE,
Washington, D. C.

GENTLEMEN: I have been considering the purchase of some cash registers and bookkeeping equipment to help me keep the information necessary to control my business and make out all the reports now demanded by State and Federal agencies—now I see in the papers that Congress proposes to place a 10-percent tax on such machines.

If you are going to tax us in order to meet the expenses of this war, and I think most people around here will agree with me on this, why not place a tax on everything so that each person will bear his and her share?

These business machines are just as necessary to us businessmen as planes and tanks are to our Army, so please don't pick us out as the particular class who will have to pay more than its share of the bills.

Respectfully yours,

L. J. BAUMANN.

EXCHANGE OASIS CAFE,
Houston, Tex., August 21, 1941.

UNITED STATES SENATE FINANCE COMMITTEE,
Washington, D. C.

GENTLEMEN: At a recent meeting of the Houston chapter of the State Restaurant Association of Texas, of which I am president, I was appointed to write you regarding our position on the proposed bill now before Congress contemplating a 10 percent excise tax on cash registers.

We have a membership of 87, mostly small restaurant operators. While we realize that increased taxes are inevitable and we expect to carry our part of the load; all members present at the meeting felt that cash registers least of all should be taxed and that 10 percent was entirely out of line.

Cash registers are a business necessity and a merchant could not operate successfully without the protection and information they provide.

They are an intricate machine and already carry a price that is almost prohibitive.

Since the tax that the Government will receive will depend largely on the systems used by merchants, it should encourage rather than discourage the purchase of cash registers.

We feel that a tax of 10 percent on a business necessity is exorbitant and will deter rather than aid tax receipts.

Very truly yours,

C. M. LINDSEY,
President State Restaurant Association of Texas.

LAWRENCE COUNTY RETAIL DRUGGISTS ASSOCIATION,
New Castle, Pa., August 20, 1941.

SENATE FINANCE COMMITTEE,
Washington, D. C.

GENTLEMEN: Our organization is opposed to the 10-percent excise tax bill as applying to store equipment.

We feel that the retail business is already burdened with more than its just share of tax.

We earnestly request that your committee not recommend such tax.

Respectfully,

LAWRENCE COUNTY RETAIL DRUGGISTS ASSOCIATION.
By CARL S. PAISLEY, *Secretary.*

FARMERS' & CONSUMERS' CO., INC.,
Fort Worth, Tex., August 21, 1941.

SENATE FINANCE COMMITTEE,
Washington, D. C.

GENTLEMEN: We have been reliably informed that your committee has approved a tax to apply on calculating and office business machines. If this is true we wish to register a vigorous complaint. Among the overhead we bear is the expense in connection with the food stamps, a charge by the banks to make collection at Dallas, all the excise taxes applicable. Business machines are an absolute necessity and surely there is no need to tax a businessman with the tools for use in his business.

Please reconsider your approval of this tax.

Yours truly,

FARMERS' AND CONSUMERS' CO.,
By W. E. GUINN, *Comptroller.*

SEABOARD OIL CO., INC.,
Fairfield, Conn., August 22, 1941.

SENATE FINANCE COMMITTEE,
Washington, D. C.

GENTLEMEN: I have watched with growing concern the increased taxes on the small independent merchant in this country.

The contemplated tax on office equipment, cash registers, and similar items that are not luxuries but absolute necessities to my business seems to me to be directed at the small businessman. All of these articles are necessary to conduct a business and make enough profit to pay the heavy taxes we already have to bear.

I would appreciate any effort that you may make in changing this tax legislation so that it would be fairer to the independent merchant of this country.

Very truly yours,

GEORGE N. SERRE,
Vice President and Secretary.

Mr. VANDENBERG. Mr. Chairman, at this point in the record, may I ask that there be inserted for the information of the Senate a short statement made by Mr. Stam on the general subject of a general manufacturers excise tax as printed at pages 86 and 87 of the House hearings? It is very illuminating and covers the entire proposition.

The CHAIRMAN. The clerk will give it to the stenographer, Senator Vandenberg.

(The statement by Mr. Stam is as follows:)

GENERAL STATEMENT AS TO GENERAL MANUFACTURERS' EXCISE TAX PROPOSED IN 1932

As an emergency depression measure, a general manufacturers' excise tax was proposed in 1932 in H. R. 10236, Report No. 708, Seventy-second Congress, first

session, and reported to the House of Representatives by the Committee on Ways and Means. In general, it was modeled on the principles of the Canadian sales tax and was designed to prevent pyramiding or imposing several taxes as a product passes from manufacturer to manufacturer, dealer to dealer, and so on, resulting in cumulating or duplicating the tax. Manufacturers and producers were to be licensed. Goods passing from a licensed manufacturer, producer, or registered dealer to another manufacturer, producer, or registered dealer were to be free of tax. Foodstuffs, farmers, and small businessmen were to be exempt. Otherwise it was considered advisable to restrict exemptions and keep the base very broad. The rate proposed at that time was 2¼ percent on the manufacturers' price determined at the factory or place of production and was designed to raise for 1933 about $595,000,000. The proposal was debated in the House and defeated.

Features of 1932 proposal

Rate.—Rate was to be 2¼ percent, to raise, in 1933, $595,000,000.

Imposition of tax.—The tax was to be imposed generally upon the price at which the manufacturer or producer should sell the commodity. Provision was made for determining the sale price which was to be the basis of the tax. In general, it was to be the manufacturer's or producer's price at the factory or the place of production. It was to be imposed upon the sale of every article sold in the United States by the manufacturer or producer thereof, except manufacturers or producers exempt from licensing under the bill, with certain exceptions necessary (1) to prevent pyramiding and (2) exceptions required by the Constitution.

Exceptions to imposition.—1. Exceptions necessary to prevent pyramiding included provision for the tax-free transfers between licensed manufacturers of articles for further manufacture. Licensed manufacturers were to be allowed to sell to registered dealers, free of tax, articles to be resold to licensed manufacturers for further manufacture.

2. Sales for exportation and sales by manufacturers to States and political subdivisions thereof, and agencies thereof, were exempted for constitutional reasons. (Sales to the United States, the Territories, and the District of Columbia were not exempt.)

Exemptions.—Necessity for a wide base was considered necessary and emphasized. There were a few specified exemptions, including:

1. Farmers.
2. Staple food products.
3. Small manufacturers.

Farm products and foodstuffs exempted are set out in section 602 of the bill, H. R. 10236. Farmers were exempted from licensing (sec. 606). Small manufacturers and producers, with gross sales of less than $20,000, were exempted to lessen the administrative burden which would be occasioned by licensing them (sec. 606).

Essential tests of a sound plan

The Committee on Ways and Means set up, as six fundamental tests of a sound manufacturers' tax, the following (Rept. No. 708, 72d Cong., 1st sess.):

(1) The rate should be low, so that undue burden will not be imposed.

(2) Certainty, both as to liability and account, must be attainable in advance of the sale.

(3) Pyramiding must be prevented.

(4) The tax must be imposed uniformly and without discrimination.

(5) Provision must be made for the least administrative difficulty (such as classifications arising in connection with exemptions).

(6) Adequate authority must be granted to assure a sound, smoothly functioning, and flexible administration.

Certainty.—It was considered essential that persons required to make returns and pay the tax must know in advance of the sale whether the sale is taxable and the amount of tax liability. Also he must be able to rely on such determination. Retroactive imposition or change in method by which the tax is computed were to be avoided, as likely to result in hardship and break-down of the tax.

Certainty was provided by authorizing advance decisions by the Commissioner by preventing retroactive changes and rulings and regulations, and by authorizing final closing agreements.

Elimination of pyramiding.—Imposition of several taxes with respect to any article (pyramiding) was considered to have been eliminated by a system of licensing, described below.

All manufacturers and producers (other than those whose gross receipts were less than $20,000, who were exempt) were to be licensed. Provision was made for sale of articles tax-free from one licensee to another. By this method, the product of one manufacturer which was to be used as a material by a second manufacturer, could pass through all stages of manufacture without the imposition of a tax. Thus, the tax was to be imposed but one, and that upon the final sale of a finished product as it entered the channel of consumption.

Also, in order that partly manufactured goods could pass through wholesalers, dealers, or importers, the licensing system was applied also to persons of this class, or "registered dealers." They could purchase tax-free articles which they were to resell to licensed manufacturers for further manufacture. In this respect, the 1932 proposal differed from the then existing Canadian system, where all wholesalers were licensed and could make all their purchases tax-free. By this feature of the 1932 proposal the heavy administrative burden of issuing licenses and supervising licenses was to be avoided.

Uniform application of tax.—It was desired that each member of a competitive group pay tax upon substantially the same basis as all of his competitors. Manufacturer's or producer's price at place of manufacture or production was to be the base of the tax.

Avoidance of administrative difficulties.—Such avoidance was considered necessary in order that the tax work fairly. For instance, a large exemption list would have required an administrative agency to pass on proper classification, such determination would involve delay and retroactive application, with hardship on business.

Wide scope of tax.—By section 617 of the bill the articles on the sale or importation of which the tax would be applied included commodities of every description, thus spreading the incidence of the tax over a broad field.

Additional administrative personnel.—Such personnel was authorized.

Effective date of the tax.—It was provided the tax would be ecffective 30 days from the date of the enactment of the tax.

Sales tax not to apply to articles already taxed.—Articles already subject to Federal excise taxes were not to be subject to the tax.

STATEMENT OF ALVIN E. DODD, NEW YORK, N. Y., PRESIDENT, AMERICAN MANAGEMENT ASSOCIATION

The CHAIRMAN. Mr. Dodd, will you give your name, please?

Mr. DODD. Alvin E. Dodd, president, American Management Association.

The CHAIRMAN. You are addressing yourself to the same subject that Mr. Stowell discussed?

Mr. DODD. Yes, Mr. Chairman.

The CHAIRMAN. You may proceed with your statement.

Mr. DODD. What I would like to do, Senator, is to give a sort of highlight of this 4-page memo I have. I do not need to go into all of it.

The CHAIRMAN. Yes.

Mr. DODD. Rather, I want to speak for management, both business and industrial, and to try to interpret the feeling that management reflects through the organization of which I am the president, rather than speaking for any special group of manufacturers making these machines or anything related to that sort of thing, because this 20-year-old association of which I am the head has, as its objective, better management. That includes everything it contributes to make efficient business operation, more skillful and economical manufacturing, more intelligent and productive selling. Composed, as it is, of about 4,000 industrial and commercial companies and their execu-

tives interested in advancing management techniques, we are interested in all phases of management. We make no profit; we do no lobbying, and advance no propaganda, nor espouse any causes except that of better management. So our sole interest is the solution of management problems.

Of course, let me state parenthetically, we recognize that money has got to be raised, and also, I want to indicate full support of the principles set forth by the Treasury Department to this committee on April 24. In other words, what I am going to say is hung on the principles enunciated by the Treasury rather than on being against something per se. Rather, I think that this excise tax that Mr. Stowell was talking about is somewhat against the principles that I believe the Treasury enunciated very correctly, and those were two cardinal principles really: That the money should be raised equitably and should be raised with a minimum of disruptive effect, that is, should be collected with a minimum of interference with the effective mobilization of all our manpower, managerial capacity, business enterprise, and national resources, and that the additional tax burden necessitated by the emergency should be distributed equitably among the several segments of our population.

While the Treasury gave some other observations on principles that I have down here, I will skip some of them, but in the field of excise taxation, it is proposed that a number of new taxes be imposed and the rates of some existing taxes be increased.

The Treasury said they would endeavor to avoid excise taxes which would fall on the basic necessities of life, and excises which would constitute an increase in the cost of doing business and thus would be passed on to the Government and to the public in general price increases. The Treasury said they had selected certain luxury articles which, though widely used, were not necessities.

Then they also pointed out that the program outlined would do effectively the job, and in fairness to everyone. So that I believe you will agree with me that the Treasury's suggestions—and I am now quoting from what Mr. Sullivan said when he was representing the Treasury, that—

> The Treasury's suggestions distribute the burden in a fair and equitable manner and that this entire tax program will be accomplished without disrupting or dislocating industry or our economy.

The passages of this quotation which I have stressed are clear indications of the intention to be equitable and to be nondisruptive.

Now, as authorities on industrial management and on defense have pointed out—Mr. Stowell did it very well—the typewriter and business machine are engines of war. For what sort of a defense program could we conduct without typewriters? Some of the people in industry suspected that something was going on in Iceland weeks and weeks before, because they were all ready to send typewriters and business machines up there before any soldiers sailed to Iceland. For what sort of defense program could we conduct without the business machines? All of the paper and calculating work in defense industries would have to be laboriously done by hand. The production of business machinery must increase because, obviously, with huge increases in our production we are going to need more in order for industry to function efficiently. We are very much concerned

about the speed-up in this whole production situation, or the lack of it. Such efficiency, in turn, is another of those principles set forth by the Treasury Department.

So, I submit for the consideration of this committee that the imposition of an excise tax upon business machinery—certainly today, at least, in the light of today's endeavor toward the epitome of all-out defense—is contrary to the very tenets to which both Government and management are trying to adhere.

In the Treasury Department's April statement to the House Ways and Means Committee, the point was brought out that "one important motive" in the imposition of excise taxes should be to curtail consumption—hence, of course, production—of items which compete with an all-out defense program. Is this not a contradiction of purposes? We must have more, not less, of business machinery to do our defense job. You look at the questionnaires that the O. P. M. sends out and what is the first line on top? "Put in typewriting."

I believe there is no plan to impose excise taxes upon plows, harvesters, or the lathe or milling machine, or upon the shipbuilder's tools or the loom that weaves the soldier's uniform. The business machine is just as basic an implement of war, an instrument of defense, a vital tool for keeping other tools going, for we certainly exist by records. Such records as we must have to do a proper defense job are possible only through business machinery of various kinds. Why put an excise tax on one small segment of our defense machinery? Indeed, the Government finds business machinery so important a factor in direct defense that the Priorities Division of O. P. M. has pronounced it an "essential industry defense supply" with a rating of A–10.

Furthermore, the Government is today taking aproximately 50 percent of the production in this field. That picture you are going to have put in the record is a very dramatic example of that sort of thing. Of course, as the Government does not pay taxes on that high percentage of the output they are taking, the revenue would be relatively small, and, I suspect, very much less than was originally thought of, because when that was figured out it is doubtful that they had realized what those pictures show and how much less it would bring. But that is not the important point. The important point is that it is a very discriminative tax, as I have pointed out.

So may I urge in summary your consideration of the fact that management—the commercial and industrial management whose views I have tried to give you—will pay a tremendous share of the defense bill in any case. It can produce more revenue from increased business than from an inequitable excise tax on one small segment of essential defense machines.

I come back to the thought you raised a while ago, Senator Vandenberg.

Senator VANDENBERG. You mean you agree to a small manufacturers' sales tax in substitution for the excise taxes?

Mr. DODD. Yes; I think, that is, on an equitable basis. I sincerely believe, however, that the time has come for us to have the political courage to bring the income tax down into the lower brackets. I also believe that an excise tax (that will be inequitable anyway) will contribute little toward solving the problem of increasing revenue.

Thank you very much.

Senator VANDENBERG. If this bill goes through, there is a manufacturers' sales tax on probably 3,000 items of commerce, so we have already abandoned any thought that it is against the law to discuss a sales tax, and if you are going to have a half you might as well have a whole one.

Mr. DODD. A lot of people do not like sales taxes; I do not believe Congress likes them, but what are we going to do?

Senator VANDENBERG. We do not like any of the taxes.

Mr. DODD. Mr. Chairman, I desire to read into the record a letter addressed to the committee by Mr. William H. Evans, secretary, National Office Management Association, expressing opposition to the proposed excise tax on office equipment.

(The letter referred to is as follows:)

NATIONAL OFFICE MANAGEMENT ASSOCIATION,
Philadelphia, Pa., August 11, 1941.

SENATE FINANCE COMMITTEE,
Washington, D. C.

GENTLEMEN: Your clerk, Mr. Johnston, has suggested that this association, composed of approximately 1,750 individuals interested in better management, express to you through Mr. Dodd, its reaction to the proposed excise tax on office equipment.

Our members are opposed to the imposition of such a tax because of its evident effect upon office efficiency. Modern industrial and financial activities are dependent almost completely upon the paper work of the office. In a thousand different ways, from the computation of pay rolls to the conduct of correspondence, machines play an important part in business. Typewriters, computing devices, addressing apparatus, and the countless other mechanical aids enable the office manager to discharge his responsibilities in a fraction of the time which would otherwise be necessary.

Furthermore, office help which would be required to replace machinery is not now available. This condition has already severely handicapped private and governmental organizations.

In these times no obstacle should be thrown in the way of increased productivity, and no industrial enterprise can move any more freely than its office routines permit. It is our belief that the problems of the office would be greatly intensified if such a tax were to be levied.

On behalf of the members of our association, therefore, I request the rejection of the proposed tax.

Respectfully yours,

WILLIAM H. EVANS, *Secretary.*

The CHAIRMAN. Thank you very much. Mr. Lawrence.

STATEMENT OF JOHN V. LAWRENCE, WASHINGTON, D. C., GENERAL MANAGER, AMERICAN TRUCKING ASSOCIATIONS, INC.

Mr. LAWRENCE. Mr. Chairman and members of the committee: My name is John V. Lawrence. I am general manager of the American Trucking Associations, Inc., with offices at 1424 Sixteenth Street NW., Washington, D. C.

The association is a federation of 50 individual associations representing our industry in the various States, the District of Columbia, and the Territory of Hawaii. Among its members are represented all of the various types of trucking service.

Members of the various State associations are members of the national organization, and they exercise their franchise through such local associations.

Power in the national organization lies in a board of directors, consisting of seven members from each State, Federal district, or Territory, drawn from all the various classes of truck operations.

At the outset, let me state that the motor-carrier industry stands solidly behind the efforts of the Congress to give the Nation an adequate defense, a defense which will enable it to successfully meet any eventuality which the future may bring. We realize, of course, that this means spending vast sums of money, some of which must be raised by increased taxes, and all of which must eventually be paid by such levies.

The trucking industry, at the present time, pays each and every one of the general business taxes which other industries are subjected to.

In addition to these ordinary taxes paid by all businesses, the truck operators are, and for sometime past have been, paying to the Federal Government the annual sum of over $100,000,000 in the form of excise taxes on trucks, accessories, parts, fuels, and lubricants, a form of taxation to which no other industry is subject.

We appeared before this committee on the excess-profits tax proposal of 1940. We want to again thank you for the very sympathetic consideration that was then given our problem by you. Because of the capital structure peculiar to this industry, we were not in most cases able to use the invested capital basis for computing this tax without punitive results. Because of low earnings, with many carriers in the red—we are in very much the same situation that Judge Fletcher's people were in—in the base period the average earnings method under the original act of 1940 rested heavily on our people. Considerable relief was granted them in the 1941 amendments which were passed by the Congress. We do hope that the average earnings method will be retained as an alternative to the invested capital basis of computing the excess-profits tax.

Adequate truck transportation facilities are an essential factor in carrying on the present defense program of this country. A quick survey conducted by the motortruck committee of the Automobile Manufacturers Association, the results of which were included in a brief filed with William S. Knudsen, Director General, Office of Production Management, on April 24, 1941, showed that 36 companies engaged in defense production had 4.3 percent of their incoming traffic and 22.1 percent of their outgoing traffic move by motortruck. The total percent of incoming and outgoing traffic was 12.1 percent.

As typical of unsolicited comment in those replies, the brief said, one aircraft manufacturer reported 90 percent of its tonnage handled by truck, because the trucks permitted a lower minimum load. Thus smaller quantities could be accumulated quicker by truck than by rail.

Another aircraft manufacturer reported 50 percent of its tonnage handled by truck, with 100 trucks a day moving in and out. Both of these firms expected decided increases during the last half year of shipments handled by truck.

A survey made by a leading truck-trailer manufacturer recently of 455 motor carriers disclosed that the amount of their defense business ran anywhere from 10 percent of their volume to 95 percent of their volume. That cannot be exact, because in common-carrier traffic particularly, one never knows, for instance, when a bit of material passes through their hands, some may go into defense and some may not, and of course, that was not segregated.

Manufacturers' excise taxes were originally imposed as emergency taxes on articles deemed to be luxuries, or at least dispensable conveniences. Automotive products are clearly necessities today, because of the very use to which they are put. This is particularly true of equipment, parts, tires, fuel, and so forth, for truck transportation.

As I indicated before, trucks, in special State taxes on license tags and gasoline, more than pay their share of road construction and maintenance cost. Chairman Eastman of the Interstate Commerce Commission in his study as Federal Coordinator of Transportation on Public Aids to Transportation found that, without crediting motor-vehicle operators with Federal excise taxes paid, or special motor-vehicle taxes diverted by the States to nonhighway purposes, these same operators overpaid their share of highway costs by $501,138,000 between the years 1921 and 1937. This annual overpayment showed a steady increase, reaching its peak in 1937, when it amounted to $110,772,000.

Mr. Eastman found the trucks more than paid their share of highway costs, by as much as $287 per vehicle per year on the largest for-hire vehicles.

The act of June 25, 1940, increased excise taxes on tires by 11.1 percent, on tubes by 12½ percent, on truck chassis by 25 percent, on parts by 25 percent, and on lubricating oil by 12½ percent. In addition, one-half cent was added to the Federal excise tax on gasoline, or an increase of 50 percent for defense purposes.

The bill before this committee, as it comes from the House of Representatives, doubles the already increased rate of excise taxes on equipment, tires and tubes and parts—and I refer to truck equipment. In addition, a 5 percent tax is placed on trailers and semitrailers, not in effect before. This is an impost placed on one form of transportation not visited on all others.

As I indicated before, earnings from 1938 on have been very slim. They were slim in 1936 and slim in 1937. Class I motor carriers had an operating ratio of 97.26 percent in 1938 and 95.14 percent in 1939. Chairman Eastman, of the Interstate Commerce Commission, in a concurring opinion in MC–F–1108, Keeshin Freight Lines, Inc.—Issuance of Notes, decided by the Commission on February 3, 1940, held that prosperous conditions in the motor-carrier industry required an operating ratio of 90 percent. In recent months, with rising costs, carriers who formerly netted 5 percent on their gross revenue have seen their percentage shrink in half.

These increased excise taxes will still further shrink this revenue to the vanishing point, particularly if this Committee should go further and recommend an excise tax on the gasoline used.

Specific figures, however, speak probably more eloquently than I am able to. One truck line operating on the Atlantic coast, and which keeps close account of the mileage and gasoline consumption of its trucks, indicates that its vehicles average slightly in excess of 114,000 miles per year—that is the intercity vehicles—with a gasoline consumption of 4.2 miles to the gallon. This mileage, which applies to their interstate over-the-road trucks only, is not unusually high. At this rate, each road truck would consume 27,143 gallons of gasoline per year. An increase of 1 cent per gallon in the gasoline levy would cost this company $271.43 per truck per year.

Another company, also operating in the Atlantic coastal area, but with a shorter operating radius than the line just referred to, has an average gasoline consumption for all of its vehicles, both over-the-road and the lighter and more economical pick-up trucks, of 8,000 gallons per year. The heaviest over-the-road trucks, in contrast, consume over 19,000 gallons each annually. An increase of 1 cent in this tax would mean an increased annual cost to each truck of $190.

Another operation, operating in Missouri and nearby States, has an annual per-vehicle consumption of over 12,000 gallons.

Those figures I have given are just typical. We could pick them across the country in varying mileages, but they are all high.

Quite to the point, also, is the fact that this increase in operating costs could not be passed on down the line, eventually to be paid by the ultimate consumer, as is the tax, for instance, on cigarettes. It is easy enough to say, "Why not have the rates increased?" but that is not easily done in an industry whose rates are regulated as a public utility.

We cannot very well, under our tariff rules, issue a freight tariff to a man and say we burned 17 or 17½ gallons and the tax will be so much and that is included and distributed to the shippers.

The CHAIRMAN. Your industry would rather have the $5 use tax on the automobile——

Mr. LAWRENCE. That would be a fraction of what the increase would be if the gasoline tax were increased 1 cent.

The CHAIRMAN. Than the 1-cent-per-gallon increase on gasoline?

Mr. LAWRENCE. Yes; I might mention right here that our industry is a little different than what most people base price theories on. A man manufactures shoes, or a lot of other commodities that just run through a production line, and if he doubles his production the chances, are his unit profit, say it is 10 cents a unit, is going to increase on the double production when he ships those shoes, but on transportation it is much different. Take for instance in Senator Vandenberg's city of Detroit in his State; Detroit is typical of troubles that a transporting agency has in getting a balanced movement for freight in-bound and out-bound, so much moves on its own wheels, whereas the trucks that the clothing people use moved in, and the parts go on their own wheels. That has been the bugbear of transportation.

I was speaking of defense. We have movements out of Akron, to one of these eastern airplane plants. It is overnight service. Trucks leave at 8 or 9 o'clock at night, and deliver early the next morning at the airplane plant. They want parts quickly. They thought it was splendid business. That truck operator, by dint of effort, built up a return business from this eastern city that pretty well balanced his load. His rates are based on 62½ percent load factor. He has got to get at least that on the round trip, whereas if he gets five or six extra loads at night and he has nothing to go back he is losing money on every load he handles.

The same thing with camps in the Southwest. Where you had towns of 5,000 people before, with a balanced situation worked out after months and years of effort, they have suddenly 30,000 or 40,000 people in this territory and everything is moving in. While you may say this upsurge of traffic is helpful in increasing the growth of

business, it cuts the margin of profit, because the traffic gets unbalanced and the operating ratio goes up. It is different from the manufacturing business in that respect. So the only out we have is to get an increase in rates, and anyone familiar with public-utility rates knows it is quite easy to get rates decreased before a public commission, but it is another problem to get them increased. It is long drawn out and they are broke by the time their rates are increased.

Now we appeared before this committee before. I might mention before concluding that we have this problem, too, that the size of a unit is restricted, naturally, and properly so, by State law, that we cannot just hook on something more when we have an increased load. We have got to put another man on the truck. Our labor actually runs about 50 percent of our gross operating dollar. We have more labor to pay, we have more loaders. In lots of States we have to break the load into two loads, with almost 50 percent increase in cost. So the increased volume does not convert itself into increased profit. In other words, the margin on the unit gets smaller and smaller as it grows up in times like these.

We have appeared before this committee before with our problems, and have not failed to receive sympathetic consideration. We are quite confident that again we will receive the same degree of consideration and we hope accord with our ideas. Once again we wish to reiterate that we are entirely in sympathy with the national-defense program, cost what it may. But we urge that you refrain from taking a chance on crippling transportation on which, in the event of hostilities, the success of our military and naval operations must, in the last analysis depend.

Senator VANDENBERG. As the bill now stands, then, the only thing apparently that you complain against is the new excise taxes?

Mr. LAWRENCE. That is so; they are practically doubled, as I recall, Senator. Of course, we have always over our head the threat of the gasoline tax. We are thinking about that also.

Senator VANDENBERG. Do you want to substitute the general sales tax for the excise tax?

Mr. LAWRENCE. In the record before the House committee, in the extension of my remarks in the House hearings, we pointed out we felt it was a fairer proposition not to visit those larger taxes on a selected few.

Senator BARKLEY. Do you think, with the experience we have had in excise taxes, that we can pass a general sales tax in a few minutes?

Senator VANDENBERG. Let me follow up Senator Barkley's suggestion. We have established the principle of a general manufacturers' sales tax. Let us say it is 3 percent this year; if your problem next year requires additional revenue you confront the very simple expedient of increasing your rate. You do not have to write your law all over again. It is an advantage instead of a disadvantage.

Senator BARKLEY. That is being done in this bill. That is what this bill is, to increase excise taxes.

Mr. LAWRENCE. I guess we were unfortunate enough to be selected as the first. It is just a continual increase.

The CHAIRMAN. Are there any other questions?

Senator GUFFEY. Mr. Lawrence, how much does this tax cost the trucking industry?

Mr. LAWRENCE. If you take the whole country the cost is very great. I tried to take segments and pointed out specific trucks. There is a lot of question about the average consumption, because there is no proper detail on the trucks of this country. The Public Roads Administration is commencing this year, for the first time, to make a detailed inventory of trucks. They leave the factory, they are rebuilt, remodeled, reengined sometimes, so it is difficult to ascertain that. Many statisticians claim if you take the trucks from the little truck used by the grocery store up to the large road truck, the average is about 1,200 gallons. My own guess, taking the average, would nearer be 1,600 to 1,800 gallons a year.

Senator GUFFEY. That is the industry as a whole. I am trying to figure how much revenue the Government is going to lose if you carry out your wish. What proposition do you have to raise the money for the Government?

Mr. LAWRENCE. Senator, I am not a tax expert. The Treasury estimates are in on the excise taxes, I understand. We are just pointing out that we feel it is just coming back to the same old well all the time.

Last year we had, without complaint in the whole industry, an increase of half a cent on gasoline, but it is beginning to pinch now, coming back and back again.

Senator GUFFEY. What tax do you propose in favor of this excise tax?

Mr. LAWRENCE. I am not a tax expert.

Senator GUFFEY. Would you favor the joint return; that cuts off $300,000,000?

Mr. LAWRENCE. I am not familiar enough with that, sir.

Senator GUFFEY. All right.

The CHAIRMAN. All right, Mr. Lawrence. Thank you, sir.

The next two witnesses are Mr. Vernor and Mr. Riley, who are listed here. Now, I presume you gentlemen wish to come around, both of you.

STATEMENTS OF JAMES VERNOR, DETROIT, MICH., AND JOHN J. RILEY, WASHINGTON, D. C., REPRESENTING AMERICAN BOTTLERS OF CARBONATED BEVERAGES

The CHAIRMAN. You are Mr. Vernor?

Mr. VERNOR. Yes, sir.

The CHAIRMAN. And this is Mr. Riley?

Mr. RILEY. Yes, sir.

The CHAIRMAN. Will you state your name and whom you represent, Mr. Vernor?

Mr. VERNOR. My name is James Vernor, Detroit, Mich., appearing for the carbonated beverage industry and representing its association.

The CHAIRMAN. And Mr. Riley is John J. Riley?

Mr. RILEY. John J. Riley, secretary of the same association.

The CHAIRMAN. The same association?

Mr. RILEY. Yes, sir.

The CHAIRMAN. You gentlemen have a written brief?

Mr. RILEY. We have submitted a statement, Senator. I think it is in that folder that the clerk is passing out.

The CHAIRMAN. Do you wish to present the brief for the record, or do you wish to present the substance of it orally?

Mr. VERNOR. I would like to make a few statements, Senator, and then I would like Mr. Riley to present a summary of the brief.

The CHAIRMAN. You may do so.

Mr. VERNOR. First, I would like to assert the position of the industry that we have every desire to share our just share of this burden that we know we must have. I realize the position you are in in raising the tax burden. We do not care to sidestep anything. Any equitable tax we certainly will do our share in, but we consider the tax as proposed in the House bill a very inequitable tax.

This business is somewhat different than some of you gentlemen that buy any soft drinks in hotels may imagine. Eighty-five percent of our business has a 5-cent roof, and certainly it cannot be classed as a luxury with 85 percent with a 5-cent roof. We have a 5-cent roof price on 85 percent of our production. It is an absolute impossibility to maintain production and increase that 5-cent roof. The profits in the industry depend entirely on the net profit per case, and depend more on volume than anything else. If anything is done in the nature of disturbing the 5-cent roof, thereby destroying the volume, naturally the industry is in trouble.

I would just like to present one more picture of this to the Senators, and that is the set-up of the industry itself. That is shown in this chart that I believe we have given you with the brief.

There is, I believe, a wrong impression on the type of the industry; that is, that it is made up of plants that are making considerable money and are large plants. That is very erroneous. We have approximately 6,309 bottling plants in the industry.

The CHAIRMAN. What number, Mr. Vernor?

Mr. VERNOR. 6,309. Sixty-four percent of those plants produce less than 25,000 cases per year, and on any basis of profit that you might give them per case they could not earn over $2,500 or $3,000 to save themselves in any way they tried. In other words, it is an industry of small business rather than of large business. Twenty-seven percent of them produce between 25,000 cases and 100,000 cases per year. So that 91 percent of them produce less than 100,000 cases per year, which, in my estimation at least, could not make the highest net earnings, on any of those 91 percent, over $10,000 or $12,000, a year on their invested capital. I am only bringing that out to bring out the type of the industry and the fact that 91 percent of the industry are small businesses and only 9 percent are what you might call fairly large concerns.

Now we have prepared the brief that has been submitted, and Mr. Riley has a summary of that brief. At this time I would like Mr. Riley to give you that summary.

The CHAIRMAN. Very well, Mr. Riley.

Senator BARKLEY. Let me ask you before you begin: I notice in the chart here you have got different kinds of drink, and among them is sauerkraut juice. Do you regard that as a soft drink?

Mr. VERNOR. No; we do not.

Senator BARKLEY. That is more of a table drink.

Mr. VERNOR. That will be brought out, Senator, in the summary.

Senator BARKLEY. I just happened to see that. I wondered if you cataloged that among the drinks like Coca-Cola, grape juice, and the like.

Mr. RILEY. I might say, Senator, there are a lot of things there that we do not put in the identical category of soft drinks, but they are drinks sold through the same sources, and to some extent are on a competitive status with a soft drink.

Senator BARKLEY. "Hearts Delight," is that a soda-fountain drink?

Mr. RILEY. That is a canned drink that, with the possible exception of some greater quantity of fruit juice used and the lack of carbonation, is identical with many drinks that are put in bottles by the bottlers.

Senator BARKLEY. Go ahead.

Mr. RILEY. As Mr. Vernor has said, we are speaking on behalf of the soft-drink industry. As we interpret the provisions of section 551 relative to the proposed tax on soft drinks, they may be briefly summarized as follows:

On bottled carbonated beverages (up to 33-ounce bottles) the tax proposed is one-sixth cent per bottle if bottled to retail at not more than 10 cents.

One-third cent per bottle if bottled to retail at more than 10 cents and not more than 20 cents.

One-half cent per bottle if bottled to retail at more than 20 cents per bottle.

On bottled carbonated beverages (bottles over 33 fluid ounces) 6 percent of the price for which sold.

Then there is a tax on finished and fountain sirups of the kind used for making carbonated beverages sold otherwise than in bottles, a tax of 6 cents per gallon, and on carbonic gas sold for similar use, a tax of 4 cents per pound.

These two latter taxes, of course, are intended to apply to those sirups and carbonic gas sold for fountain use, not for bottle use, the bottle being taxed on the per bottle basis.

Two observations on the provisions of section 551 are: First, the definition of taxable "soft drink" is such that its practical effect is to exclude a wide variety of noncarbonated soft drinks manufactured and sold in closed containers as well as by the glass by numerous manufacturers, soft-drink stands and fountains. The definition subjects to the tax on finished drinks only the types of soft drinks which are carbonated—that is, those impregnated with carbonic gas, and commonly known as carbonated beverages, soda water, or pop. The effectiveness of the definition in excluding from the proposed tax all soft drinks but those which are carbonated seems to make the provision more correctly referred to as a "carbonated beverage tax," rather than a general soft-drink tax.

Now, the tax on sirups and gas for fountain use does not change this situation, as only sirups of the kind used for carbonated drinks, or gas sold for use in carbonated drinks are taxed.

The second is: Inasmuch as between 80 and 90 percent of bottled carbonated beverages are sold at retail in the common types of 5-cent bottles, with the greater proportion of the remainder in 10-cent bottles of less than 33 ounces, the first bracket applying a rate of one-sixth cent per bottle seems to be the only one here requiring consideration. The other rate brackets applicable to bottles have no great importance, from the standpoint of this brief discussion, because they are mostly of lesser application due to the smaller quantities that are sold. That one-sixth-cent rate means a tax of 4 cents on each case of 24 of the 5-cent bottles, or 2 cents on each 12-bottle case of the 10-cent bottles up to 33 ounces.

Our statement outlines these basic features of the proposed tax on carbonated beverages which make it objectionable in this way:

First, such a tax takes the form of an added special tax on earnings of the carbonated beverage bottler, where ordinary earnings exceed the tax, or is a capital levy where such earnings are less than the amount of the tax.

Second, it is discriminatory and seriously complicates competitive conditions, because it not only selects one item from the numerous foods items carried by every grocery in the country for taxation, but also limits such selection to a segment of the soft-drink industry itself.

Third, it is basically unsound in relation to the industry.

Fourth, because of the effect of this tax upon the bottlers' earnings taxable under the income-tax provisions of the bill, and these other factors, the net revenue yield from the industry may be expected to be substantially less than that estimated.

The tax on carbonated beverages appears as one planned for absorption by the bottler, or the retailer, or both. In any event that would be its practical effect because of the very nature of the industry, which, for the vast bulk of its product, operates under the 5-cent roof that Mr. Vernor has spoken of, and which experience has shown we must keep if we expect to keep the business alive.

Senator VANDENBERG. Let me ask you at that point. In the World War you faced an extra tax. In some instances was an effort made to pass the tax on? Was the 5-cent roof raised?

Mr. RILEY. It had a very serious effect. That was one of the reasons the tax was taken off.

Senator VANDENBERG. That is what I was going to ask.

Mr. RILEY. It was a different type of tax, but that was the effect of it.

Senator VANDENBERG. A retail tax?

Mr. RILEY. It was a tax on the bottle. It had a very serious effect in the increased price to the consumer.

Senator BARKLEY. What was the tax?

Mr. RILEY. It was 10 percent of the bottler's price.

Mr. VERNOR. When they raised that price to 10 cents it cut the volume exactly in two. The volume went right in two.

Senator VANDENBERG. How about 1932, when you had approximately the same tax that is proposed now? What did you do? Did you try to raise the retail price?

Mr. RILEY. The retail price was not raised, but we suffered the same things that we rather anticipate in this bill.

Senator VANDENBERG. What did you suffer?

Mr. RILEY. We suffered a cut in the profits, a large portion of the earnings of the bottler, for one thing. In other words, that was a tax on earnings in addition to this ordinary income tax.

Senator VANDENBERG. So you have now the experience at both ends of the line to prove, first, that you cannot lift the roof; and second, that you cannot absorb it?

Mr. RILEY. That is right.

The CHAIRMAN. When was the sirup tax imposed?

Mr. RILEY. That was put in two different bills, Senator. The first was in 1921 and the last one in 1932.

The CHAIRMAN. In 1932?

Mr. RILEY. Yes.

Senator BARKLEY. Let me ask you: The ordinary drink that costs 5 cents a bottle to the public, to the consumer, produces a gross of $1.20 a case to the retail distributor; is that right?

Mr. RILEY. If he sells it for a nickel a bottle straight; that is true.

Senator BARKLEY. If he sells it for a nickel a bottle for 24 bottles—what does he pay for the 24 bottles?

Mr. RILEY. His price may vary according to the different drinks, but the common price is between 70 and 80 cents.

Senator BARKLEY. Well, we will take Pepsi-Cola or Coca-Cola. What is the price on those?

Mr. RILEY. I think the price on those is 80 cents.

Senator BARKLEY. So he gets 60 cents profit?

Mr. RILEY. No; 40 cents, Senator.

Senator BARKLEY. Yes, 40 cents. And the tax would be 4 cents on that case. One-sixth of a cent per bottle, that is 4 cents. So that after paying the tax he will still have 36 cents. Of course, that is not net profit.

Mr. RILEY. This tax is not on the retailer; this tax is on the bottler.

Senator BARKLEY. That is true. If that is passed on it has got to go on through the retailer.

Mr. RILEY. The retailer will not take it.

Senator BARKLEY. Suppose it is passed on to the retailer; suppose he did pay this tax to the bottler, who has paid it in the first instance, that is 4 cents a case. Suppose the retailer pays it. He would pay 84 cents instead of 80 cents, unless the bottler pyramided the tax and charged him more than 84 cents a case, which I do not suppose any bottler would do. Do you say the 4 cents cannot be absorbed out of the 40 cents?

Mr. RILEY. My knowledge, in saying it could not be absorbed, sir, is rather limited, because I am not familiar with the problems of the retail grocer. The grocer who is familiar with the problem says right at this moment this 40 cents is not sufficient to cover the ordinary costs of maintaining his stock, to cover his movement costs which, in the case of the 5-cent bottle, means the same movement that he may incur with a 25-cent or 30-cent article, plus refrigeration and cooling costs, plus the cost of accounting for the deposits that he must get on the bottles, plus the cost of handling the empty bottles and sorting them when they come back. That is his argument.

Senator BARKLEY. Yes. He has made that argument to you?

Mr. RILEY. Yes.

Senator BARKLEY. And you are making that argument to us?

Mr. RILEY. This tax is not on the retailer.

Senator BARKLEY. You are claiming that the retailer cannot absorb it.

Mr. RILEY. That is in our brief, Senator.

Senator BARKLEY. You are telling us what the retailer has told you. I wonder whether it would be entirely out of the ordinary procedure if somebody knows whether he can absorb it, not simply hearsay, who would come here and tell us that?

Mr. RILEY. Well, of course, I am telling you what is common knowledge in the trade.

Senator BARKLEY. I am not trying to multiply witnesses, but I am trying to get at the facts.

Mr. RILEY. It is a matter of such common knowledge in this industry that everyone in the industry knows it. I am sure Mr. Vernor can explain to you some of the difficulties in retailing, because he is an actual bottler of soft drinks. He can tell you what their attitude is.

Senator BARKLEY. It is your position that the bottler cannot pass it on to the retailer?

Mr. RILEY. That the retailer will not accept it, and the bottler cannot accept it. Furthermore, since the retailer has so many means of avoiding it, not only under the bill, but under the competitive conditions——

Senator BARKLEY (interposing). If they all paid this tax, which amounts to 4 cents a case, one-sixth cent on a bottle, if they all paid it then they are all on the same basis.

Mr. RILEY. All who, Senator?

Senator BARKLEY. All of the bottlers. If they all paid it, which of course they will, and if they all passed it on to the retailer, which they may do in the wholesale price that they get, instead of 80 cents we will say they get 84 cents, that would only mean 4 cents a case to the retailer.

Mr. RILEY. That would be an ideal solution, Senator, but it never would work out that way.

Senator BARKLEY. Why not?

Mr. RILEY. Because that has been the experience of the industry. It will not work out that way. We have some bottlers who are making more than four cents a case. In the past they absorbed the tax, and they will do it again. There is a vast number of the industry who are not making four cents a case and they cannot absorb it. If they do they will go out of business.

Senator BARKLEY. If all the bottlers pay the 4 cents a case tax and they pass it on to the retailer, it is a simple matter of adding the 4 cents to the 80 cents, or 60 cents or 70 cents, whatever it is that they have already paid. That might be hard on the retailer, because the retailer might not be able to charge one-sixth of a cent on the bottle when he sells it to Dick, Tom, and Harry. But the question I am trying to find out is—and I am simply trying to get the facts, because I do not know—whether out of the difference between the wholesale price or the bottler's price to the retailer plus the 4 cents a case the retailer can afford to deal in the drink and make a reasonable profit.

Mr. RILEY. I do not believe he can. From what knowledge I have of the industry, and from what information we have, his net per case, after all of the costs I have referred to are incurred, is just a couple of cents.

Senator BARKLEY. If he pays 80 cents a case and sells it for $1.20, his gross profit is 50 percent. How much of that 50 percent would he have to knock off in order to get to his net profit?

Mr. RILEY. He would have to knock off all except a very small part, perhaps a very small percentage, a case.

Senator BARKLEY. You mean the retailer who is selling bottled drinks is charging enough overhead for all bottled drinks so he can get the profit out of everything else he sells?

Mr. RILEY. I do not say that is true, but it is one of the retailers' contentions that it costs at least a cent a bottle to put out soft drinks. There is 24 cents out of the 40 cents right there.

Senator WALSH. Is there some breakage?

Mr. RILEY. There is plenty of breakage; yes. He must stand the cost of the deposit that he has paid on the bottles broken.

Senator BARKLEY. Take the little automatic—maybe they are not automatic—distributing boxes, or whatever you call it, out in front of a garage or in front of a gasoline station, where you go up and either take a bottle out of an ice-cooled compartment or take it out of an electrically cooled compartment, do you think that it is an average cost of doing business for that particular concern to be out 24 cents a case for distribution?

Mr. RILEY. I do not know what it is, and that amount of cost may not apply in such instances for distribution, because there is less labor charge. But that is only a portion of the movement costs I have mentioned.

Senator BARKLEY. Go ahead.

Mr. RILEY. Of course, on the question of discrimination, the condition that that seems likely to create in the industry and competition resulting from other items for the consumer's nickel, it will bring the retailer to concentrate, we feel, upon these competitive items. And because of his own interests, as I have been speaking of here, in maintaining his own profit, the net effect of this proposal is to put this tax directly on the bottler. That has been the experience, and that seems to be the intention, and was the expressed intention apparently in the Ways and Means Committee, to at least have it absorbed either by the bottler or by the retailer. Our contention is you cannot pass it on to the retailer; that the bottler has to absorb it in some way or another.

Now, as to whether or not this could be absorbed—Mr. Vernor has already shown you that this is an industry of small businesses. We have some large plants, good large plants, but they are just a minute portion of the industry.

We also have plants that make a fair margin of profit. This has been broken down in the chart. Out of the 6,309 plants there are almost 700 plants that are losing money. There are 1,594 plants that have a margin that is not greater than the tax here proposed, 4 cents a case. We have 1,700 plants that have a margin between 5 and 9 cents a case, and then a balance of 2,304 plants on a margin of over 9 cents a case.

Senator WALSH. Is the number of small plants increasing or decreasing?

Mr. RILEY. The number of plants in the industry, Senator, has been relatively stable in the last 4 or 5 years. I could not say definitely just as to that condition.

So that applying this 4-cents-a-case tax to the one-third of the bottlers of the country who are making 4 cents or less, it either takes all of their profit or appropriates part of their capital.

For almost another one-third the tax would take from 45 percent up to 80 percent of their earnings per case. The remainder would be, of course, affected in a lesser degree, but the tax would still take a very substantial proportion of their earnings. This would be particularly serious in the case of those bottlers who, notwithstanding the higher margin per case, have a low sales volume and consequently small income. In other words, there are some of those in the top bracket of earnings per case but which are very small plants.

This tax would, of course, have to be paid in addition to the taxes on net income which they pay in common with all other citizens.

And as I have previously stated, carbonated beverages are the only type of soft drinks in closed containers, that is in bottles, cans, or kegs, which are subject to the proposed tax.

The unfair competitive situation with which the industry is faced, even if it could absorb the tax, seems apparent when we realize the great variety of soft drinks sold in cans, in bottles, or dispensed from bulk by the glass, but differing essentially from the bottled carbonated drinks only in that they lack that characteristic which makes the latter taxable, which seems to put them in that class, and that is carbonation.

To these must be added the numerous types of undiluted fruit juices, concentrated juices, soft-drink powders and sirups, all sold in competition with the carbonated drinks. These untaxed canned and bottled drinks and powders are illustrated in the photograph, which you have in the folder, but the photograph does not illustrate the untaxed drinks of the thousands of corner drink stands and fountains, untaxed because they are not carbonated, and because they use no taxable sirups of the kind used in making the carbonated drinks. Under the bill, these other drinks are thus being endowed with a competitive profit margin, amounting to the tax the carbonated beverage bottler must pay, which they can use to further entrench their position as his competitor in the soft-drink market.

It also seems obvious that those manufacturers of the other items in competition for the nickels of the consumer, such as the popular types of 5-cent candies and other confections, chewing gum, packaged cookies, ice cream cones, and other 5-cent frozen items, will be in the field with this competitive tax margin as an added advantage if any such tax on carbonated beverages is enacted.

Even among the bottlers themselves we have a serious competitive situation. Some of these are outlined in rather detailed form in the statement, but I do want to mention one which I do feel is the most serious, and that is that the proposed tax would result in the concentration of the bottled soft-drink business into the hands of these bottlers who have attained a position of financial strength, and the elimination of many of the weaker members of the industry.

The chart classification shows those bottlers enjoying a profit margin per case of over 9 cents, and while numerous, as I said before, that total includes plants that are small, in small communities with limited sales volume, and must be eliminated from it. We figure there are about one-third, or somewhat less than one-third of the plants in the industry making perhaps fair total earnings that would be able to absorb this tax.

Should any such absorption become an actuality, all bottlers would be obliged to do likewise, regardless of their low margin per case or the limitation upon their annual earnings, or be at hopeless disadvantage in pricing their products to the retailers. A large proportion of them would eventually be bankrupt by this attempt to keep their business intact through the competitive necessity of absorbing a tax equalling the major portion or all of their earnings, or actually in excess of such earnings.

Adding to this competitive situation, if the tax is enacted, of course we could speak to some extent of the bottlers constantly increasing costs. I am not going to take up your time on that, but I do want to point out particularly our problem, our inability to change the size of our package. With one-third of the bottler's total investment in bottles and cases, you do not have the ease of changing the size of the package. To pass the added cost and added taxes on to the consumer is an absolute impossibility as far as our package is concerned.

I think it is important that I call your attention to the item of tax costs. The bottler has borne, and is bearing, his share of increasing Government costs, particularly in the way of State and local license and privilege taxes of various kinds and amounts, to which other business is not always subjected, and also by income taxes.

The additional taxes to be levied under other provisions of H. R. 5417 will add to these costs. For example, bottler's costs of flavoring extracts will be increased by the proposed alcohol tax increase, and his cost of operation will be increased by the proposed new taxes, or higher rates of tax on automobiles, trucks, parts and accessories, tires and tubes, mechanical coolers and refrigerating apparatus, electric signs and electrical appliances, business machines, telegraph, telephone, transportation, radio and outdoor advertising, and the use of motor vehicles. A total of $5,000,000 is believed to be a fair estimate of the total of such added costs to the industry.

This total added to the amount of the proposed tax on bottled sales, plus such further decrease in industry income as may result from the competitive situations engendered by the tax proposal, will substantially reduce the taxable income of the industry as a whole, and, of course, the income taxes computed on such income.

The obstacles to economy in the administration of soft drink taxes in the past and the difficulties of collection seem certain to be repeated under this bill, and must also be considered in this determination of the net results from a revenue standpoint.

For example, the tax of 6 cents per gallon on fountain syrups and 4 cents per pound on carbonic gas for fountain use will invite competitive adjustments, which will make it easily evaded or impossible to administer.

Senator CONNALLY. How much tax do you advocate on soft drinks?

Mr. RILEY. Senator, we do not advocate any tax on soft drinks. We believe it is an entirely impossible tax.

Just as examples; I have three or four but I will mention two. Take flavor, either fruit flavor or artificial flavor, or soft-drink powders—they can be mixed in bulk without a sirup and carbonated and the tax on sirup avoided because there is no sirup used at all, if our interpretation of this bill is correct.

One more example: Chocolate sirup is used in carbonated chocolate sodas, but also in chocolate milk shakes and on ice-cream sundaes. Its taxable status can readily be a matter of endless controversy, because who is to say, or who can say, whether such use makes it of the kind used for making carbonated drinks?

In this connection we must also point out that the proposed tax will fall from 2 to 3 times as heavily on the carbonated beverage bottler as it will on the carbonated beverage portion of soda fountain soft drink sales. As an example, if a bottler sells 120 bottles, on which we will assume there is the price of 80 cents, his tax is 20 cents and his ratio of tax is 5 percent. The same 120 drinks can be exactly the same drink sold by the soda-fountain proprietor for $6 and his tax is 8 cents, and the rate is 1⅓ percent.

Now, we believe it is important that consideration also be given to the characterizations given similar taxes on soft drinks in the past in the reports of the Committee on Ways and Means, the Senate Committee on Finance, and also by the Treasury. In those reports similar taxes, or taxes having a similar effect, at least on the industry, are called in the reports unwise and unjust; they must be paid out of capital and to that extent it constitutes a capital levy; very difficult to administer; widely evaded; administrative nuisance and adversely affecting business; are not great revenue producers; not highly productive; ill-defined and uncertain; widely evaded and evasion cannot be stopped without the employment of a larger number of agents and measures more drastic than the potential importance of these taxes would justify.

On this last statement from the reports I may also call attention to the fact, which I do not think was brought out clearly in the brief, that this tax on finished bottled carbonated drinks and on the fountain sirups, and on the carbonic gas involves, as I said, the 6,300 bottlers; it involves, we estimate, 125,000 fountains, and we have no means of knowing how many dealers sell carbonic gas who will have to pay the tax. So as a minimum you have a total of 131,300 taxpayers from whom to collect revenue, from whom you will have to get the returns and audit them each month.

Gentlemen, I am going to conclude with just a statement which summarizes our brief, and that is that the industry does not argue that its products can be substituted for the meat, potatoes, and flour on which armies are fed. But it does submit it is as manifestly unreasonable to select carbonated beverages from the grocer's stock for taxation as it would be to levy an excise tax on any one of his other items of vegetable juices; fruit juices; frozen desserts; ices and ice cream; dessert, ice cream, and beverage powders and gelatins; sirups; spices; ketchups, prepared mustards, sauces and salad dressings; preserves; fruit butters; jams; jellies; pickles; confectionery and candies; nuts and nut butters; chewing gum; chocolate and other

sirups; prepared foods for dogs, cats, and other pets; tea, coffee, and cocoa.

Senator CONNALLY. How about cigarette and plug tobacco?

Mr. RILEY. I am sorry, we are talking no position on those. I am not familiar with them.

Senator CONNALLY. We do tax those.

Mr. RILEY. We have taken the position that it is unfair and unreasonable to tax any one particular commodity selected from a group when it is in competition with other commodities.

Senator CONNALLY. Then you favor repealing the cigarette tax, the cigar tax and tobacco tax?

Mr. RILEY. I would not want to put our association on record to that extent, Senator. At least the principle of general taxation is the one thing we stand on.

Senator CONNALLY. How about gasoline? You tax gasoline. Why should not soda fountains pay a little tax, and the bottlers? I am just exploring this subject.

Mr. RILEY. Yes. We agree we will have to pay more taxes, we readily agree we will have to pay more taxes, if you will just let me conclude this statement.

Senator CONNALLY. Pardon me.

Mr. RILEY. The soft-drink bottler contends it is most unjust to levy this tax which, due to the factors previously outlined, will have the effect of a special supertax upon his earnings, when he pays the same taxes on income and profits to the Federal Government as the drink-stand proprietor, the canner or the preserver, the ice-cream manufacturer, the chewing-gum manufacturer, the confectionery manufacturer, the dog-food manufacturer, or the manufacturer of any of these other grocery items. The bottler is ready and willing to bear his full share of the Nation's tax burden at this critical time by such increase in taxes of general application as Congress may deem necessary to distribute that burden equitably and in recognition of the equal interest all industries and all taxpayers have in it.

Senator CONNALLY. What is his share?

Mr. RILEY. Beg pardon?

Senator CONNALLY. What is his share?

Mr. RILEY. Any increase in income taxes that is shared equally by all citizens who have the same vital interests that he has in this Government and in its support.

Of course, if there must be a tax on product sales, the soft drink bottler urges that it should be a general tax, levied upon a base sufficiently broad to distribute the burden with the least hardship by taxing all or substantially all commodity sales at the same rate, thus giving this and each other industry a chance of holding its own in the competitive field, producing the maximum revenue, and being the least disruptive of this and other industries in a similar position.

Senator CONNALLY. Would you advocate repealing the beer tax, the whisky tax, and wine tax? They have to pay an income tax, too. You need not answer if you do not want to; that is all right.

Mr. RILEY. I would say this, Senator, however, that we have been concentrating our attention particularly on food items into which we think the soft-drink product falls, because it is on the grocer's shelf with other hundreds of commodities, and soft drinks have been picked out as the one item for special taxation.

Senator CONNALLY. We are helping your business now by taxing beer. That makes the man pay more for beer. The tax is to your advantage, it seems to me, instead of disadvantage.

Mr. RILEY. That is a matter of opinion with which I would not agree.

Senator CONNALLY. Let me ask you this: Do you prefer this one-sixteenth of a cent, I believe it is, on a bottle to be paid by the bottler or would you prefer a 1-cent tax to be paid by the purchaser?

Mr. RILEY. We think both are equally vicious and equally harmful on the industry.

The CHAIRMAN. Are there any further questions?

Senator CONNALLY. That is all I have.

The CHAIRMAN. Thank you.

(The statement submitted is as follows:)

STATEMENT ON BEHALF OF THE AMERICAN BOTTLERS OF CARBONATED BEVERAGES BEFORE THE COMMITTEE ON FINANCE OF THE UNITED STATES SENATE

TAX POSITION OF THE BOTTLED-SOFT-DRINK INDUSTRY

The bottled-carbonated-beverage industry, in a statement before the Committee on Ways and Means of the House of Representatives at the hearings preliminary to the drafting of H. R. 5417 by the American Bottlers of Carbonated Beverages, has presented its general views in opposition to special excise taxation of soft drinks.

In that statement the men and women engaged in the bottled-carbonated-beverage industry indicated their sincere desire to bear their full share of the tax burden required for national defense, but urged that fairness and recognition of the equal interest of all industries and all consumers in the preservation of the American way of life required such burden to be distributed by an equitable system of general taxation—whether it be in the form of increased taxes on income, a general sales tax, or a general manufacturer's tax.

The industry desires to reassert this position before the Senate Finance Committee, and to make apparent the facts upon which such opposition is based, to the end that such facts may demonstrate its entire propriety under our American principles of justice and equality and that by so doing this committee will be aided in finding a proper solution to the revenue problem.

THE SOFT-DRINK TAXES IN H. R. 5417

At the conclusion of lengthy deliberations by the Committee on Ways and Means the proposal to levy an excise tax on soft drinks was incorporated in H. R. 5417 (pt. V, New excise taxes, sec. 551—Soft drinks) in a substantially modified form (1).[1]

As passed by the House, section 551 proposes the following tax:

1. On bottled carbonated beverages (up to 33-ounce bottles), section 3402–b–1–A:

⅛ cent per bottle if bottled to retail at not more than 10 cents.
⅓ cent per bottle if bottled to retail at more than 10 cents and not more than 20 cents.
½ cent per bottle if bottled to retail at more than 20 cents per bottle.

2. On bottled carbonated beverages (bottles over 33 fluid ounces), section 3402–b–1–B: 6 per centum of the price for which sold.

3. On finished syrups of the kind used for making carbonated beverages sold otherwise than in bottles (such as at fountains), a tax of 6 cents per gallon (sec. 3402–c–1); and on carbonic gas sold for similar use, a tax of 4 cents per pound (sec. 3402–d–1).

It should be pointed out that there is no great significance in the one-third-cent and one-half-cent per bottle brackets just mentioned, nor the 6 percent rate on exceptionally large bottles because about 90 percent of bottled carbo-

[1] For notes see supplement to this statement.

nated beverages are sold at retail in 5-cent bottles and on almost all of the balance in the "quart" classification the usual price is 10 cents. That remainder sold in bottles over 33 fluid ounces, or for more than 10 cents, consists of only an extremely small portion of the industry's production.

For purposes of discussion we may therefore consider the vital point to be the one-sixth-cent per bottle tax proposal, which represents a per case tax of 4 cents on each case of 24 small (5-cent) bottles.

It is particularly vital to note here that, because of the diversified nature of the soft-drink industry the definition of soft drinks in the bill (sec. 3402–a–1) causes the proposal to lose its identity as a tax on soft drinks, and to become a special tax on carbonated beverages or soda water. It also is the only tax on a food product (if we except wines) in the bill.

Of equal importance is the fact that, due to characteristics of the industry differentiating it from most others (2), the provision cannot have the expected effect of an excise tax, but becomes a special tax on either the capital or the income of the bottler, as will be outlined more fully later. Obviously, any such result will bear heavily upon this industry of small businesses, more than two-thirds of the units of which have maximum gross sales of less than $20,000 per year (3).

The adoption of a tax rate of one-sixth cent per bottle by the Committee on Ways and Means appears to represent wholehearted recognition of the disastrous results certain to follow a rate of tax which would necessitate an increase in the 5-cent retail price for approximately 90 percent of America's bottled soft-drink consumption.

The apparent theory of the provision, as approved by the House of Representatives, therefore, is to levy a tax to be absorbed by the bottler or by the retailer of carbonated beverages without resorting to a price increase to the ultimate consumer (4).

THERE IS A SERIOUS FLAW IN ANY SUCH "ABSORPTION" THEORY

The fallacy of any such theory is demonstrated by an explanation of the economic basis upon which the bottled carbonated beverage industry must operate (2).

1. *The customary nickel price to the consumer for the bulk of the industry's products constitutes a "roof," which experience shows may not be exceeded without disastrous results upon the volume of sales*

This was clearly demonstrated before the Committee on Ways and Means, based upon the recent experience of the industry in States where an increase in retail price to 6 cents was necessitated by the levying of a 1-cent-per-bottle tax, such as that contained in the original Treasury recommendation.

That it is a well-established economic fact, so far as the soft-drink industry is concerned, is also apparent from the harmful effects of Federal taxes under the Revenue Act of 1918 on soft-drink consumption, concerning which testimony was given at that time as a basis for their repeal.

2. *The profit margin of the retail outlets, upon which the carbonted beverage bottler depends almost entirely as the means of getting his product to the consumer, cannot be decreased*

As an incident to the handling of bottled soft drinks the retailer incurs all of the costs involved in the maintenance of his usual stock, plus those specific costs applicable to this particular product (such as costs of cooling and refrigeration), plus a substantially heavier movement cost per dollar of sales due to low value per unit sale, and the costs of handling the returnable bottles and accounting for the bottle deposits which are typical of soft-drink sales.

Evidence already exists to indicate dissatisfaction among soft-drink retailers with current margin on soft drinks, prior to any further reduction through a shifting of the proposed tax. Grocery stores are a major retail outlet for bottled soft drinks. In a resolution adopted by the National Association of Retail Grocers of the United States, in convention in Kansas City, Mo., on June 19–22, 1939, the grocers alleged insufficiency of current margin on bottled soft drinks to cover the costs of handling empty bottles.

3. *Solvency in the bottled-soft-drink industry, as in every other industry, means that the bottler must maintain a margin of profit on his operations, but such margin requires control of costs (5) to a degree not understood outside the industry*

Examples of some of the more important and current of these cost problems will be helpful:

Sugar is an important factor among ingredient and material costs (*6*). Inasmuch as the quantity of sugar used in a case of bottled carbonated beverages varies from a minimum of 1½ pounds per case to as much as 3 pounds per case or more, depending upon the type of drink and the size of bottle, it is readily realized that an increase of a fraction of a cent per pound in sugar cost may mean the difference between a profit and a loss to the thousands of plants in the industry operating on an extremely narrow margin of earnings per case.

This is particularly true in the smaller plants, where sugar is purchased from local wholesalers in relatively small quantities. Since August 1, 1940, the wholesale price of sugar has increased 85 cents or more per 100 pounds, which means a cost increase of from 1¼ to 2½ cents per case (*7*).

Increased use of fruit juices in bottled carbonated beverages is one of the major developments of the past decade. Because of the higher cost of ingredients and greater possibility of spoilage, this has required investment in special equipment and rigid cost control to keep the consumer's price of the drink within the 5-cent "roof."

For example, surveys by the California-Arizona growers show that during the 1938–39 season approximately 82 percent of the juices processed from navel and Valencia oranges went into beverage bases for the bottled-soft-drink industry, using over 77,000 tons of oranges. Over three-fourths of that quantity was for carbonated-beverage bottlers. Florida-orange tonnage for similar use, while not as large, is reported to have quadrupled in the last 3 years. Over 5,000 tons of grapefruit is diverted annually to the uses of the bottled-carbonated-beverage industry by one growers' association in the Southwest, contributing much to relieve the surplus problem in fresh-fruit sales channels. Only two out of many manufacturers of flavors for the bottler's product report the use of about 75,000 gallons of grape juice annually in such beverage bases. Complete reports would show these examples to represent but a portion of the amount of surplus fruit crop that is used in the manufacture and bottling of carbonated drinks.

The added cost of the proposed tax will be a serious handicap to the bottler in his efforts to make and sell the juice-type drink in the 5-cent market. This may have a most serious effect upon the continued development of that type of drink right down the line from the bottler to the flavor manufacturer, to the fruit processor, and to the fruit grower.

Labor costs involved in the bottling, selling, and distribution of carbonated beverages amount to from 30 to 40 percent of dollar value of sales, so that the steady increase in such costs which bottlers have experienced during the past few years has created numerous problems for them in their effort to keep out of the red.

The average wage scale of labor in the beverage industry, as reported by the Department of Labor, is the highest among the food industries listed (*8*).

An important factor in consideration of this cost item is the attention the industry has given to maintenance of substantially level employment throughout the year, even though two-thirds of its annual production and sales occurs during the warmer period of less than 6 months. This means, in the great majority of instances, that the bottler operates his plant at a loss during much of the remainder of the year and depends upon the compensating increase in sales volume during the summer to bring sales for the entire year sufficiently above total costs to produce a reasonable return on his investment (*9*).

The degree of dependence upon the temperature and the weather for profitable operations is one of the major hazards of the industry.

Selling, delivery, and service are important items of cost to the soft-drink bottler. Increased sales come only through large costs for labor, equipment, and overhead in maintaining that constant sales and service operation, direct to the retailer, which is essential to make soft drinks easily available to the consumer when he wants them, where he wants them, and how he wants them.

This requirement has largely outmoded mass distribution through wholesalers. It has made soft-drink bottling an industry of 6,300 local plants serving the 2,899 communities in which they are located (*10*). It has given to sales and service costs an importance fully equal to plant and ingredient costs, from the standpoint of control and of effect on earnings.

Changing trends in consumer purchasing have contributed to rising costs. The increased purchase of carbonated beverages for home consumption, which has affected a substantial change in the soft-drink market in the past few years, requires the added expense of cartons. A doubling of the investment in bottles has not been unusual because of the delay in their return by home consumers to the retail outlet and the greater bottle losses. While sales volume has been increased, these factors result in a smaller margin per case.

New developments in plant equipment to offset these rising costs, at least in part, and to insure sanitary operation and purity of the products have required heavy investment by the industry (*9*) and consequently increased maintenance and overhead costs. At the insistence of the industry, the practices of bottling on foot-operated machines, and of washing bottles by hand, have been relegated to the past. Today the medium-sized plant ordinarily means an investment of about $100,000 for sanitary and efficient operation and to provide for normal growth.

4. Tax costs are particularly important

All of the taxes now imposed on other kinds of business for local, State, and Federal purposes are being paid by the soft-drink industry.

In addition, the bottlers are paying, in many States, license and privilege taxes of varying kinds and amounts, to which other business is not always subjected. Because of these special State and local licenses, it can fairly be said that in relation to investment, business volume, and earnings, the bottlers of soft drinks are already subject to a degree of taxation which is fully equal to, or in excess of, the taxes laid on many other kinds of business. The industry has borne, and is bearing, its share of increasing State and Federal governmental costs. Because of the vital importance of maintaining the 5-cent "roof price" for the product, these rising tax costs have not been passed on to the consumer.

The additional taxes to be levied under other provisions of H. R. 5417 will create special problems for the industry.

For example, alcohol used in making the flavoring extracts for soft drinks is an important item of cost. At the present time the tax on such alcohol is 1,600 percent of the cost of the alcohol, and represents a tax cost of approximately 1.2 cents per case of the finished soft drink. The increase of $1 per proof gallon provided in this bill will increase this tax cost by one-sixth.

Other bottlers' costs of operation will be affected by the proposed new taxes, or higher rates of tax, on automobiles, trucks, parts and accessories, tires and tubes, mechanical coolers and refrigerating apparatus, electric signs and electrical appliances, business machines, telephone, telegraph, transportation, radio and outdoor advertising, and the use of motor vehicles.

A total of $5,000,000 is believed to be a fair estimate of such added costs to the industry under H. R. 5417.

5. The ability of the soft-drink bottler to meet competition and remain in business therefore depends upon withstanding the "squeeze" exerted on his margin of profit by the force of his costs of manufacture and distribution from below, and by the inflexibility of the retail "roof price" and the dealer's margin from above

Some owners of bottling plants, because of careful control of costs, a fortunate combination of volume and plant capacity, and successful merchandising, have been more successful than others in withstanding this "squeeze," with the result that earnings in the industry vary widely—some produce a higher rate of earnings than others, while many are losing money in their efforts to become established.

Based upon a recent survey of 1940 operations, it is estimated the bottling plants in the industry fell into the following profit margin classifications:

Per case margin (or loss)	Number of plants	Percentage
Loss over 4 cents per case	284	4.5
Loss 4 cents or less	409	6.5
Profit:		
0 to 4 cents	1,594	25.3
5 to 9 cents	1,718	27.2
Over 9 cents	2,304	36.5

It is apparent from the foregoing summary of margin per case in the bottling industry that such a tax would constitute a capital levy upon those bottlers who are losing money or are earning less than 4 cents per case. Over one-third of the industry is in this position. It would be a very heavy special income or profits tax upon bottlers earning as much as 9 cents per case, and its absorption without immediately serious effect upon survival could be accomplished only by that proportion of the industry now earning more than 9 cents per case. The proposal therefore presents a serious threat to the preservation of the industry and to the continuance of employment for many thousands of workers during the critical period which the Nation is facing.

6. *Concentration of bottled soft-drink business*

One result of the proposed tax would be the concentration of the bottled soft drink business into the hands of those bottlers who have attained a position of financial strength, and the elimination of many of the weaker members of the industry.

The above classification of bottlers enjoying a profit margin per case of over 9 cents includes numerous plants in small communities with limited sales volume, and relatively low total earnings per year. It is estimated, therefore, that the larger and financially stronger bottlers whose margin per case may permit absorption of the 4 cents per case tax, by relinquishing a substantial portion of their earnings to that purpose, operate less than one-third of the plants in the industry.

Should any such absorption become an actuality, all bottlers would be obliged to do likewise, regardless of their low margin per case or the limitation upon their annual earnings, or be at a hopeless disadvantage in pricing their products to the retailers. A large proportion of them would eventually be bankrupt by this attempt to keep their businesses intact through the competitive necessity of absorbing a tax equaling the major portion or all of their earnings, or actually in excess of such earnings.

In the end the strong would become stronger, the weak become weaker, and the livelihood and investment of thousands of taxpayers in the industry would be utterly destroyed.

In addition, those members of the industry producing 5-cent drinks and having an investment of million sof dollars in bottles which must be used may find themselves in a precarious competitive position due to this provision of the House bill which taxes the 24-bottle case of small 5-cent bottles at 4 cents per case, but taxes the 12-bottle case of large 10-cent bottles at 2 cents per case. This incongruity is further emphasized by the provision taxing 36-ounce bottles at 6 percent, amounting to between 4 and 5 cents per case, depending upon the selling price to the dealer, even though its retail price is 10 cents (the same as the 32-ounce bottle).

The trade generally considers each large bottle, which usually sells at 10 cents, as the equivalent of 2 of the smaller 5-cent bottles. Sold in 12-bottle cases (compared with 24-bottle cases of the smaller sizes), the retail selling price per case is generally the same, which is also ture of the price per case to the retailer.

Such a situation seems certain to produce extreme inequities.

It must be remembered, also, that the greater number of plants in the bottled-soft-drink industry have no franchise connections with sirup- or flavor-base manufacturers. Most of them purchase their basic raw materials in the open market, compound their own flavoring sirups as the preliminary to actual combination of such flavored sirups with carbonated water. Each such bottler is the flavoring-sirup manufacturer and the bottler combined.

There may be, in the minds of some, an assumption that the flavor and sirup manufacturers may be in a position to absorb a part of the proposed tax, which seems doubtful. But even if that were true, the bill makes no provision of this sort, and the franchised bottlers are in no position to demand modification of existing contracts with flavor and sirup manufacturers to that end. Even if this absorption were possible and occurred voluntarily, it is clear that the large group of bottlers above referred to, who make their own flavoring sirups, would be unable to obtain any tax-cost advantage by such a course, and that they would, therefore, be subjected to a terrific handicap under which many of them would be unable to survive.

The nature of the proposed tax, therefore, is such that it can have no relation to profit margins or volume of profit. As previously stated, the more prosperous bottlers, a relatively small group, may be able to absorb the proposed tax without serious effect on solvency, although for this group it would constitute a heavy special tax on profits—in addition to the taxes they pay on income in common with all other individual or corporate taxpayers.

For the rank and file of the soft-drink bottlers the tax would amount to confiscation of all or a large proportion of the profits, and it would throw a substantial number of them into the loss column—thus actually becoming a capital levy.

THE HOUSE BILL CREATES OTHER INSURMOUNTABLE OBSTACLES

It is most important to realize in considering the carbonated-beverage tax provisions of H. R. 5417 that there are many basic economic factors which differentiate such proposal from other excises listed and which create serious obstacles to the fulfillment of its purposes.

The more vital of these will be outlined:

1. *The retailer has many avenues of escape from any attempt to require him to absorb any proportion of the proposed tax, and he will resist it successfully, with serious effect upon the carbonated-beverage industry*

He may limit his soft-drink stocks to those numerous types of noncarbonated canned and bottled drinks (usually made from a combination of juices, artificial flavors, or other flavoring materials, with fruit acid, sugar, and water), which, excepting for carbonation, are substantially the same as this industry's products, and which are untaxed under the House bill.

He may endeavor to influence customers to purchase untaxed beverage sirups, packaged beverage powders, beverage flavors, and concentrated fruit juices for mixing of soft drinks and mixers at home (*11*).

He may direct his selling efforts to items sharply competitive with carbonated beverages and which are untaxed, or relatively so, such as the numerous popular types of 5-cent candies and other confections, chewing gum, packaged cookies, ice-cream cones and other 5-cent frozen items, and many others.

If he feels compelled to sell carbonated beverages notwithstanding the tax, he may decide to stock only the larger size bottles (such as quarts) selling for 10 cents, because his gross selling price per case is the same but the tax cost to him is only half of that on the smaller bottles.

In any event retailers would tend to concentrate their sales efforts on the fastest moving items. The introduction of new brands and the sale of local brands not supported by costly advertising would alike be handicapped.

As a result of these obvious and natural dealer reactions the final impact of the taxes would be most severe upon the independent bottlers—that is, upon those who would not have the sales promotional support of Nation-wide advertising and other methods of sustaining consumer interest. Thus there would be the same tendency toward concentration of the industry through elimination of the weaker bottlers as would ensue if the more prosperous bottlers absorbed the tax. In this case the weaker bottlers would suffer from a decline of dealer interest in handling their products with a consequent drying up of their sales outlets, rather than from direct expropriation of their profits.

But when a concern is being put out of business, the precise nature of the destructive forces is of less importance than the cold fact that the sheriff is taking over.

2. Other potential competitive problems presented by the "soft drink" tax provision of part I of title V of the House bill are numerous and of vital importance

For example, in those few instances since 1917, when excise taxes have been levied on "soft drinks," not only have there been included such products as carbonated beverages and carbonated waters but also the other types of soft drinks—specifically designated as fruit juices (unfermented), fruit juices (with sugar added), imitation fruit juices, grape juice, mineral waters (natural and artificial), still drinks (meaning noncarbonated), and other table waters (natural and artificial) (*12*).

In the provision here being considered bottled carbonated beverages and carbonated waters have been made subjects of the proposed tax to the exclusion of all of these other types of soft drinks, thus providing the basis for severe competitive problems, disruption of the industry, and demonstrating the utter ineffectiveness of such a tax as a revenue means.

Still drinks—meaning those which are substantially identical in every feature with carbonated drinks with the exception that they are not impregnated with carbonic gas, and do not effervesce—are an important competitor with carbonated beverages in the soft-drink field.

Such drinks are produced by soft-drink manufacturers in bottles; by the canners in cans (*13*); by dairies in bottles (*14*); mixed by the corner drink stand in bulk and dispensed by the glass; and by the soda fountain.

With a cost differential (or profit margin) equivalent to the amount of the proposed tax, the Government will have put the bottled carbonated beverage manufacturer in a competitive position which will be disastrous to him. Competitors selling the bottled or canned noncarbonated drinks may readily influence the retail outlets to give preference to their products on account of their lower cost and greater profit margin because not burdened with the "soft drink" tax.

Noncarbonated drinks dispensed from bulk or by direct mixing of flavoring materials (not syrups) with sugar and water in the glass by drink stands and fountains will likewise operate tax free in competition with the same flavor of drinks in bottles which are taxed solely because they "fizz."

Very low carbonation is a desirable characteristic of some types of drinks (such as some bottled orange drinks, root beer, and others). It seems ironic that one bottler would bear the burden of a special heavy tax on his earnings because he has developed a market for a bottled orangeade with just sufficient carbonation to give it a perceptible tang, while a competitor bottler, canner, dairy, corner drink stand, or fountain proprietor can avoid that burden merely by selling the same product without carbonation.

Fruit juices (with or without added sugar) are an important feature of the soft-drink market, and particularly since they are being sold in 5-cent cans. Iced in the same coolers, vended through the same types of vending machines, and distributed at ball games and similar places by the same hawkers in competition with the carbonated types of drinks (often of the same flavor) in bottles, the proposed tax on the latter seems most unjustified, unfair, and without reason.

This is especially true since the product is developed as a competitive item for sale as a soft drink, in soft drink outlets, and often sold from the same delivery vehicle from which the bottled drinks are sold to the retailer (*15*).

The soda fountain or drink stand where drinks are dispensed in bulk is, of course a major competitor of the bottled carbonated beverage manufacturer.

Such an outlet is the manufacturer of the product it sells, and to that extent is comparable to the bottler. But it sells direct to the consumer at the full retail price, whereas the carbonated-beverage bottler sells to the retailer at wholesale. The benefit of this income differential, plus many cost advantages coming from absence of investment in expensive machinery, delivery equipment, the heavy losses incident to the use of bottles, and from less expense for labor, give the fountain and soft-drink stand a decided advantage over the bottler in earnings per dollar of sales.

Notwithstanding these competitive advantages enjoyed by them, under the provisions of the House bill all soft drinks sold by them excepting those in which carbonated water is used are excluded from the definition of taxable "soft drinks."

This means that all fountain drinks made by mixing water and sugar with lemon juice, orange juice, grape juice, or with any of the variety of artificial flavors, or soft-drink powders—so long as carbonated water is not used—are not in the taxable class.

It is true, of course, that under the provisions of the bill when carbonated drinks are dispensed at such fountains the sirups used are taxed at 6 cents per gallon, but even in that event it is a prerequisite to taxability that a sirup must have existed in the preliminary operation. With carbonating equipment installed in every soda fountain it is conceivable that the sirup tax is subject to easy avoidance by mixing the flavor, sugar, water, or other ingredients in bulk and then carbonating it for dispensing by the glass, or by mixing the flavoring ingredient in the glass and adding sugar and carbonated water.

A further competitive complication is added by the fact that the same finished sirup is commonly used by the fountain or stand for a given flavor of drink in carbonated or noncarbonated form, and for other purposes. Chocolate sirup, for example, is used for preparing chocolate sodas (carbonated), but it may also be used for making chocolate milk shakes, or in chocolate ice-cream sundaes. A question of interpretation immediately arises whether or not this is identified as a sirup "of the kind used in * * * mixing" carbonated drinks because of its use in chocolate sodas, or whether its other (and perhaps more prevalent) uses determine its classification and nontaxable nature.

Carbonic gas tax at the rate of 4 cents per pound is proposed to be levied on that "sold by the manufacturer * * * or by a dealer * * * to any person who sells soft drinks otherwise than in bottles." The tax does not apply to gas made and used by the fountain proprietor. Past experience of the industry shows that gas generating units have been installed to escape such a tax. A saving in cost of 4 cents per pound on carbonic gas may be an inducement to revive this practice, or result in widespread bootlegging of gas for fountain use by irresponsible persons purchasing it from the manufacturers tax-free.

Further, the bottler of the carbonated drinks also faces a serious competitive situation because of gross disproportion between the tax levied on him under the bill and that proposed for competitive fountains and stands, even assuming that the 6 cents per gallon on finished syrups, and 4 cents per pound on carbonic gas, is collectible and paid on all such syrups and gas used by such fountains and stands for the carbonated drinks they sell.

Using a common type of soft-drink syrup, for example, 1 gallon will make an average of 5 cases (120 bottles) of the finished drink, on which the bottler's tax under the bill would be 20 cents. Yet the fountain on 120 glasses of the same drink will pay but 8 cents (6 cents on 1 gallon of syrup, and 2 cents on ½ pound of carbonic gas used).

With a maximum selling price of 80 cents per case by the bottler, his tax is 5 percent of his $4 sale, while the selling price of the same quantity of the same drink by the fountain proprietor is $6 and the tax is 1.33 percent of his selling price.

The competitive advantage of such a disparity in production and tax costs, plus the ability of dispensers by the glass to recoup any such increased cost on the retail sales by a minor investment in smaller glasses, which the bottler cannot do to his bottles, makes the inequities and impracticability of the provision of the House bill most apparent.

This also offers a comparison of the 1.33-percent ratio of the tax on fountain-dispensed carbonated drinks with the position of the carbonated beverage manufacturer who sells his product in tanks (for example) to stands for dispensing by the glass in competition with fountains, and on which the 6-percent rate of tax is applicable under section 3402–b–1–B.

EXPERIENCE ARGUES AGAINST THE "SOFT-DRINK" TAX

The same compelling reasons expressed by the Committee on Ways and Means, the Committee on Finance, and the Treasury as basis for early repeal of previous similar taxes on soft drinks (*16*), enacted as features of emergency Federal Revenue programs, lend full force and vigor to the carbonated beverage industry's opposition to the "soft-drink" tax proposal in H. R. 5417:

1. "* * * It is unwise and unjust, in addition to the income and war-profits taxes, to impose a heavy gross-sales tax upon products out of which the income and profits of a business are made. Such taxes should not ordinarily be imposed at heavy rates unless it is unequivocally intended that they are to be fully and invariably paid by the ultimate consumer" (S. Rept. No. 103, 65th Cong. 1st sess. August 4, 1917).

"* * * The tax in most instances cannot be paid out of the profits in the industry and must be paid out of the capital, and to that extent constitutes a capital levy * * *" (H. Rept. No. 170, 68th Cong., 1st sess., February 11, 1924).

The renewed proposal to tax soft drinks justly bears such characterization. It cannot be passed on to the consumer or to the retailer. It must be added to the bottler's cost of placing his product on the market, appropriating in the guise of an excise tax the whole or a major portion of the earnings of his business as a super-tax in addition to the taxes he pays on such earnings in common with all other citizens. There is nothing in the nature of the product or its relation to defense operations that can possibly warrant such singling it out for special exorbitant taxation on gross sales or profit.

2. "This tax has proved very difficult to administer and is widely evaded" (S. Rept. No. 276, 67th Cong., 1st sess., September 26, 1921).

"* * * An administrative nuisance and is adversely affecting business * * *" (S. Rept. No. 558, 73d Cong., 2d sess., March 28, 1934).

"* * * difficulty has arisen in attempting to establish the present-day definition of finished or fountain syrup, fruit juices, and still drinks, in view of the fact that the beverage industry has developed many new products and practices * * * (p. 77, annual report of the Secretary of the Treasury for fiscal year ended June 30, 1932).

The controversial aspects of any attempt to levy an excise tax on soft drinks are intensified by the immense range of items which properly belong in this category and by the peculiar characteristics of the soft-drink trade.

Some effort appears to have been made to minimize this difficulty by excluding, through arbitrary definition of a soft drink, many types of soft drinks and closely allied competitive products from the tax proposal. The situation thus created by the present tax proposal warrants a conclusion which is sustained by all previous experience; namely, that a general tax on all soft drinks by whomever produced or sold, is impossible of effective administration, while a tax of narrow scope, characterized by greater ease of levy and collection, becomes a grossly discriminatory imposition upon a portion of those taxpayers engaged in the soft-drink industry.

3. "As a considerable portion of the soft drinks sold are compounded at the soda fountain, and not reached under existing law, the taxes levied under existing law are not great revenue producers * * *" (H. Rept. No. 767, 65th Cong., 2d sess., September 3, 1918).

"These taxes are not highly productive * * *; they are ill defined and uncertain; they are vexatious and expensive to the dealers who pay them; and I am informed by those in charge of their administration that they are widely evaded and that such evasion cannot be stopped without the employment of a larger number of agents and measures more drastic than the potential importance of these taxes would justify" (p. 43, Annual Report of the Secretary of the Treasury for the fiscal year ended June 30, 1920).

"Difficult to enforce, relatively unproductive, and unnecessarily vexatious * * *" (statement of Secretary of the Treasury, p. 11, Internal Revenue hearings before the Committee on Finance, U. S. Senate, 67th Cong., 1st sess).

"This tax is a burdensome one and one of the most difficult to collect. The difficulty and cost of administration in collecting the taxes imposed by those sections, the inconvenience caused by these taxes to taxpayers, and the burden which these taxes place upon the industries affected justify their repeal * * *" (H. Rept. No. 179, 68th Cong., 1st sess., February 11, 1924).

The present proposal invites this same critical comment.

There has been a marked tendency to overestimate the direct revenue to be obtained from a tax of this kind (*17*), but with the problems confronting the industry today in its efforts to avoid the disastrous results of any increase in the 5-cent price of its products to the consumer (notwithstanding rising costs of materials, labor, overhead, and taxes), the effect upon ultimate revenue to the Government from the bottled carbonated beverage industry cannot be overlooked.

Those bottlers now operating profitably are paying all taxes levied on business or income. With inevitable taxes on income at rates considerably higher than heretofore known, insofar as the industry continues to produce income, there will be a considerable loss of revenue under these taxes which must be offset against the anticipated yield of the soft-drink tax.

This condition may reasonably be expected to reduce the net additional tax yield from the bottled carbonated beverage industry to no more than half of that now anticipated. Nothing is said here of the added administrative costs of such taxes, but they are likely to be substantial and thus to reduce still further the realized return from this tax.

IN CONCLUSION

1. The result of the soft-drink tax proposed in H. R. 5417 will be to disrupt the bottled carbonated beverage market and concentrate the business into the hands of the financially stronger companies. The consequence will be the closing of many plants through sheer inability to pay the tax out of earnings or to meet competition if they do not.

Were the industry one in which such condition would affect a few large plants in widely separated parts of the country, and which were susceptible to use in the manufacture of other products, the result might not be so serious.

But most bottlers have no other business, their plants are not adaptable to products other than soft drinks, and as an industry in which small plants predominate, located in 2,899 cities and towns in every State, the unemployment, decline in State and local tax revenues, and the general effect upon their withdrawal from community business life, would be widely felt.

2. The industry does not argue that its products can be substituted for the meat, potatoes, and flour on which armies are fed. But it does submit it is as manifestly unreasonable to select carbonated beverages from the grocer's stock for taxation, as it would be to levy an excise tax on any one of his other items of vegetable juices; fruit juices; frozen desserts; ices and ice cream; dessert, ice cream, and beverage powders and gelatins; syrups; spices; ketchups, prepared mustards, sauces, and salad dressings; preserves; fruit butters; jams; jellies; pickles; confectionery and candies; nuts and nut butters; chewing gum; chocolate and other syrups; prepared foods for dogs, cats, and other pets; tea, coffee, and cocoa.

The soft-drink bottler contends it is most unjust to levy this tax which, due to the factors previously outlined, will have the effect of a special supertax upon his earnings, when he pays the same taxes on income and profits to the Federal Government as the drink-stand proprietor, the canner, or the preserver, the ice-cream manufacturer, the chewing-gum manufacturer, the confectionery manufacturer, the dog-food manufacturer, or the manufacturer of any of these other grocery items. He is ready and willing to bear his full share of the Nation's tax burden at this critical time by such increase in taxes of general application as Congress may deem necessary to distribute that burden equitably and in recognition of the equal interest all industries and all taxpayers have in it.

The bottler realizes that increased taxes on income are inevitable, and has no objection to accepting his pro rata increase, and any accompanying hardships, in common with all other citizens.

If, in the solution of the problem, there must be a tax on product sales, the soft-drink bottler urges that it should be a general tax, levied upon a base sufficiently broad to distribute the burden with the least hardship by taxing all or substantially all commodity sales at the same rate, thus giving this and each other industry a chance of holding its own in the competitive field, producing the maximum revenue, and being the least disruptive of this and other industries in similar position.

Respectfully submitted.

AMERICAN BOTTLERS OF CARBONATED BEVERAGES.

NOTES SUPPLEMENTING STATEMENT ON BEHALF OF THE AMERICAN BOTTLERS OF CARBONATED BEVERAGES

(1) At the presentation of the industry's views before the Committee on Ways and Means there was available, as basis of discussion, only a vague proposal submitted by the Treasury to levy a tax on soft drinks of "1 cent a bottle and equivalents."

This proposal was obviously too indefinite and uncertain to permit of specific interpretation, but its general import was clear to those citizens engaged in the soft-drink industry.

On the basis of retail sales it involved the levying of a special excise tax of 20 percent on a simple, harmless, and wholesome food product, sold for 5 cents and depending upon the children and the wage-earners of the nation for its market. On the basis of the bottler's average selling price to the retailer the proposed tax amounted to a rate approximating 33⅓ percent.

In dealing with this proposal it was demonstrated:

1. That neither the bottler nor the retailer of soft drinks could absorb such a tax, as it exceeded their margin of profit many times over.

2. That the "passing on" of the tax to the consumer, by increasing his cost of soft drinks from 5 cents to 6 cents, would have serious effect upon sales volume of the entire industry in competition with other tax-free items devoted to the same market.

3. That a special excise tax on soft drinks is based either upon the false premise that a 5-cent drink is a luxury to the child or the wage earner who are its principal consumers, or upon the false assumption that the bottled soft-drink industry as a whole is an unusually profitable industry, because of which it is an unusually harsh, unproductive, and costly form of taxation.

4. That such a discriminatory tax would be especially disastrous to thousands of bottlers who do not have the support of extensive, Nation-wide advertising, and similar promotional efforts, and would tend toward concentration of the bottled soft-drink business into the larger and financially stronger companies, such as those selling under nationally known brands.

(2) Characteristics of the bottled carbonated beverage industry:

The principal economic characteristics of the industry should be briefly sketched, because they are often misunderstood.

1. Carbonated beverages and other soft drinks are recognized as wholesome food products. They are, of course, nonalcoholic, and are not customarily put in the same classification as alcoholic drinks either from the regulatory or the competitive standpoint

Aside from the well-known characteristics of those drinks comprising fruit and berry juices, and extractives, herbs, or spices, the sugar content of soft drinks contributes definite food, refreshment, and energy values, and in the case of effervescent drinks the carbonation is recognized as contributing tonic and healthful properties. Their manufacture, labeling, and sale are subject to all State and Federal food laws and regulations, the same as other food products. They take their place on the grocer's shelf, or on the lunch counter, among other foods competing for consumer acceptance.

Over 90 percent of the total output sells at the standard price of 5 cents per bottle. While there is no agreement as to what is meant by the term "luxury," it is certainly a misuse of the term to speak of a 5-cent luxury. There is no better evidence of the wholesome nature of soft drinks than the provision usually made for an ample supply to be available at post exchanges, at Civilian Conservation Corps camps and Army posts. They are similarly stocked in quantity on naval vessels.

2. The bottled carbonated beverage industry includes about 6,300 bottling plants in the United States at the present time

These plants vary in size from small concerns having an annual output of only a few thousand cases to a few very large plants in metropolitan areas producing a million cases or more. The industry provides employment for over 80,000 employees and owners.

The shipping of bottled soft drinks of the soda water or carbonated types from one plant to the national market is virtually nonexistent at the present time. An analysis of the census report will show that the ratio of bottled soft-drink production in each State to total production in the country is substantially the same as the ratio of the population of each State to United States population. This is an indication that the industry is primarily a local business, filling local needs from local plants and, naturally, employing local labor, paying local taxes, and otherwise participating in the general economic life of the community.

With the exception of a comparatively small number, all of these plants are locally owned. The majority of plants in number purchase their basic materials on the open market, compound their flavoring materials and finished sirups in their own way, and sell their bottled drinks under their own brands. The other plants operate in somewhat similar manner, the principal distinction being that their basic flavoring materials are purchased from a central source under contract, or territorial franchise, and the finished drink sold exclusively within that territory under the trade-mark controlled by the flavor manufacturer. In this latter group, of course, are those plants producing the nationally known brands; but the territorial rights to which brand, together with the plant and equipment, are owned locally.

3. The consumer market for bottled carbonated beverages is preponderantly among children and among wage earners in the low-income groups

In addition to those outlets serving soft drinks at fountains, the bottled drinks are distributed through virtually every type of retail outlet, a substantial portion being sold the same as other groceries for home use at meals and as refreshment.

It is a recognized fact in the soft-drink industry that carbonated drinks (such as club soda, ginger ale, lemon soda, etc.) have been declining in volume used as mixers. Those used for that purpose are estimated to be not more than 5 percent of the industry's production at the present time.

Outlets making retail sales of bottled soft drinks are estimated at over 1,000,000.

The number of fountains and soft-drink stands making soft-drink sirups, such as those taxable under H. R. 5417, and from whom the sirup tax would be collectible, and dispensing the finished drinks made therefrom, are estimated at over 100,000. In 1939 the Census of Manufactures reported the following numbers of eating and refreshment places where fountains are common: Restaurants, cafeterias, lunch rooms, 99,068; lunch counters and stands, 62,073; soft drink, juice, ice cream stands, 8,051; drug stores with fountains, 39,452; total, 208,644.

(3) Upon the basis of available data, the 6,309 plants comprising the bottled soft-drink industry are divided into the following classifications:

Estimated sales volume per year	Estimated gross sales value	Number of plants	Percent of total
25,000 cases or less	$18,750 or less	4,025	64
25,000 to 100,000 cases	$18,750 to $75,000	1,714	27
100,000 to 250,000 cases	$75,000 to $187,500	382	6
Over 250,000 cases	$187,500 or more	188	3

Just as an illustration of the comparative size of soft-drink plants, compared with candy and chewing gum. For 1939 confectionery manufacturers' production value averaged $238,000 per plant (1,252 plants, value $297,761,813); chewing-gum production averaged $2,250,000 per plant (27 plants, value $60,783,246); bottled soft-drink production averaged $81,200 per plant (4,504 plants reporting, value $365,779,000). Preliminary report, Bureau of the Census, Census of Manufactures, 1939; Value of Products and Value Added by Manufacture, issued December 29, 1940.

Even this average does not sufficiently emphasize the small size of most plants, as its computation does not include figures from about 1,900 plants, presumably because annual production did not total $5,000, which is the minimum covered by the census reports.

Preliminary report (April 5, 1941), Bureau of the Census, Census of Manufactures, 1939; nonalcoholic beverages shows total cases bottled beverages produced 479,055,717, value of production $358,232,407. Average, 74.8 cents per case.

(4) This motive was made clear in the following Washington dispatch (Trenton, N. J., Evening Times, July 1, 1941):

"As one means of raising the remaining money, the committee today looked for a way to tax soft drinks without increasing their retail prices.

"The Treasury proposed that such beverages be taxed 1 cent a bottle, but some legislators said that in States which already had tried such levies, it was found that they seriously impaired the sale of the products.

" 'What we are trying to do,' one member said, 'is to tax soft drinks as much as possible without forcing the retailer to increase his price.' "

Commenting on the provisions of H. R. 5417 as reported by the Committee on Ways and Means, of which he is a member, Mr. Treadway (Massachusetts) made the following comment in the House of Representatives (Wednesday, July 30, 1941, Congressional Record, No. 139, p. 6626):

"In the case of soft drinks the Treasury recommended a rate of 1 cent per bottle. The committee, however, took into consideration the fact that such a tax might cripple the industry since its sales depended upon a 5-cent price. Instead of adopting the Treasury proposal, the committee fixed a rate of one-sixth of a cent per bottle, which of course is equivalent to 4 cents per case. So far as I am informed, the bottling industry will not be able to absorb this tax due to its small margin of profit. I feel that the tax should be eliminated, or at least further reduced."

Commenting upon the same action by the committee, of which he also is a member, Mr. Dingell (Michigan) stated in the House (Friday, August 1, 1941, Cong. Rec., No. 141, p. 6782):

"As to the attitude of your humble servant, I have favored the elimination of this tax in its entirety, especially so since I have been in entire accord with the elimination of the tax proposal with regard to candy."

(5) Costs, for example, involve the following items:

Material:
- Sugar.
- Extracts, acid, color.
- Sirups.
- Carbonic gas.
- Crowns.
- Labels, foil, paste.
- Cartons and glass (when package is sold).

Factory labor and overhead:
- Factory labor.
- Rent.
- Building repair and maintenance, building depreciation.
- Insurance.

Depreciation:
- Machinery and equipment.
- Light and power.
- Water.
- Fuel.
- Machinery repairs.
- Factory supplies.
- Bottle breakage in plant.
- Taxes (manufacturing proportion).
- General factory expense.

Selling expense:
- Sales, salaries, and commissions.
- Traveling expense.
- Sales-car expense.
- Advertising.
- Depreciation on coolers loaned to trade.
- Samples, premium deals, etc.
- Telephone and telegraph.
- Taxes (selling proportion).
- General selling expense.

Delivery expense:
- Drivers' wages.
- Gas, oil, grease.
- Truck repairs.
- Truck insurance.
- Truck tires.
- Truck depreciation.
- Truck licenses.
- Truck general expense.
- Garage rent.
- Paint and repair—cases.
- Depreciation—cases.
- Freight out.
- Freight empties in.
- Taxes (delivery proportion).
- General delivery expense.

Administrative expense:
- Salaries and wages.
- Traveling expenses.
- Stationery and office supplies.
- Postage.
- Insurance and bond premiums.
- Dues and subscriptions.
- Legal and accounting fees.
- Depreciation—furniture and fixtures.
- Taxes (administrative proportion).
- Miscellaneous general expense.

Bottle and case loss with the trade:
Other expense:
Interest.
Discounts and allowances.
Bad debts charged off.

(6) The Department of Commerce reports the soft-drink industry was the fourth largest user of sugar products of the United States refiners in 1939, using a total of 567,473,543 pounds, of which 464,884,942 pounds were used in the manufacture of bottled soft drinks, the major portion of which was cane sugar.

According to a preliminary report of the Bureau of the Census, soft-drink bottling plants used approximately 22,250,000 pounds of beet sugar during 1939, 5,675,683 pounds of corn sugar, and 7,425,196 pounds of corn sirup. These represent substantial increases in the use of these agricultural products in 1939 over quantities previously reported for 1937.

(7) See Weekly Statistical Sugar Trade Journal, published by Willett & Gray, Inc., New York City. Issue of August 1, 1940 (p. 275), quotes prices that date of $4.15 and $4.35 per 100 pounds. Issue of July 31, 1941 (p. 277), quotes current price of 5.20 per 100 pounds.

(8) Note rate of labor costs in beverage industries in comparison to other food industries: Average hourly earnings—All manufacturing, 68.3 cents; food and kindred products, 64.1 cents (baking, 64.4 cents; butter, 49.8 cents; canning and preserving, 51 cents; confectionery, 49.8 cents; flour, 60.8 cents; ice cream, 65.8 cents; slaughtering and meat packing, 68 cents; beet sugar, 56.2 cents; cane-sugar refining, 65.8 cents; beverages, 88.7 cents). (Employment and pay rolls, December 1940, U. S. Department of Labor, Division of Employment Statistics.)

(9) The bottled soft-drink industry is reported to have invested $24,122,464 in new items of plant and equipment in 1939.

Preliminary report (April 24, 1941), Bureau of the Census, Census of Manufactures; Expenditures for Plant and Equipment, by Industry Groups and by Industries, 1939.

(10) Bottling plants in the soft-drink industry are distributed in 2,899 cities and towns of various sizes, as follows:

	Plants
Population less than 2,000	684
Population between 2,000 and 5,000	991
Population between 5,000 and 25,000	1,890
Population between 25,000 and 50,000	683
Population over 50,000	2,081

Census figures show the plants in the soft-drink bottling industry are located primarily as the means of supplying that particular area. In the eight States showing highest bottled soft-drink production (California, Georgia, Illinois, New York, North Carolina, Ohio, Pennsylvania, and Texas) the 1,648 plants included in the census report (1937) show total production valued at approximately $125,000,000, or 45 percent of the total, while those same States have 44 percent of the total population of the United States.

(11) The Successful Grocer magazine, May 1941, under the heading "Kool-Aid soft drinks," refers to the soft-drink powder sold in competition with the bottled drinks as the "Nationally advertised soft-drink powder," stating: "Kool-Aid's current advertising campaign embraces more than 815,000,000 sales messages in 18 national magazines and 3,019 local newspapers."

(12) See sections 313–315, Revenue Act of 1917; sections 628–630, Revenue Act of 1918; section 602, Revenue Act of 1921; section 615, Revenue Act of 1932.

(13) Concerning this type of drink the Western Canner and Packer magazine (1940 Yearbook and Statistical Number) states (p. 121):

"Aside from the pineapple and citrus juices there are a wide variety of other juices packed in the West. Fruit nectars make up the largest proportion of these. Deciduous fruits, particularly apricots, peaches, and pears, are used in making nectars. They are not strictly fruit juices, according to United States Food and Drug Administration rulings, because they include sugar and water with the juice and pulp of the fruit. However, under the classification of nectars of similar names they have been competing with other fruit juices. * * *

In the same issue (p. 119), concerning "Canned fruit juices":

"The phenomenal increase in canned-juice production is not a new story, but a brief résumé of available data gives a factual picture of the development of this

industry in the past decade. In 1929 the total United States canned fruit juice pack (all varieties) was 205,000 cases. A new record was set in 1939 with an estimated output of almost 24,000,000 cases."

The Food Field Reporter of August 4, 1941 (p. 3), comments on the sale of juice drinks:

"Canned juices have proved so popular that the individual style can, about 6 ounces, has been developed. Introduced in the Southern States, this 6-ounce can of fruit juice is a popular item at soda fountains, gas stations, and other soft-drink outlets."

(*14*) The Milk Dealer magazine for February 1941 (p. 75) comments upon the advantages accruing to dairies selling bottled orangeade in competition with bottlers of carbonated beverages as follows:

"That the trend is to fruit beverages is clearly evidenced by the tremendous growth in recent years of the canned fruit-juice industries. From a pack of 153,000 cases a year to nearly 24,000,000 cases a year, in 9 years' time, is little short of phenomenal—proof enough that the American public is 'fruit-juice conscious.'

"With orangeade bases of the better manufacturers today more adaptable to home delivery than ever, the milk dealer still has an advantage over the carbonated-beverage bottler in cutting a wide swath into potential fruit beverage sales. Delivery to the home from dairy retail routes is an advantage any bottler of carbonated beverages would enjoy having. Crowell-Collier's survey showed that 50 percent of all beverages are consumed in the home.

"As home sales are almost always quart sales, the consumer's cost per drink is less than that for many of the nationally known carbonated beverages which must be purchased at a store and carried home. Thus a high quality fruit beverage can be offered to the consumer by the milk dealer at a low cost per drink and with the added convenience of home delivery. Of considerable importance to milk dealers, too, is the fact that quart sales are more profitable than sales from individual bottles."

(*15*) That the soft-drink market is of considerable importance to the canners of juice drinks is indicated by the Southwest Banker magazine, May 1940 (p. 17), in which comment on canned grapefruit juice includes the statement:

"The idea of undiluted chilled juice in the soft-drink outlets 'clicked' immediately, and a new Texas industry got away to a grand start."

and (p. 14):

"One of the innovations of Texas grapefruit canners was the popularizing of a small can selling at cafes, cold-drink places, stores, etc., at popular prices to compete with the usual run of drinks."

(*16*) See exhibit I, accompanying statement on behalf of American Bottlers of Carbonated Beverages (p. 870, hearings before the Committee on Ways and Means, House of Representatives, 77th Cong., 1st sess., revenue revision of 1941) outlining the basis of levying prior taxes on soft-drink products under the various revenue acts, committee and Treasury comments on such taxes and reasons for their change or repeal, including a digest of the various acts showing products taxed, rates, collections, and effective and repeal dates.

(See Hearings Before the Committee on Ways and Means, 77th Cong., 1st sess., on Revenue Revision of 1941, vol. 1, pp. 854–880, covering statements on behalf of soft-drink industry.)

Senator DANAHER. I have here a statement which was unanimously adopted by the Connecticut Manufacturers of Carbonated Beverages, Inc., which I would like to have incorporated in the record.

The CHAIRMAN. That may be done.

(The statement referred to is as follows:)

CONNECTICUT MANUFACTURERS OF CARBONATED BEVERAGES, INC.,
Waterbury, Conn.

Hon JOHN A. DANAHER,
United States Senator, Senate Office Building,
Washington, D. C.

DEAR SENATOR DANAHER: The Ways and Means Committee of the House of Representatives has at present under consideration a proposal submitted by the Treasury Department, of a 1 cent tax per bottle on carbonated beverages, and the bottlers of the State of Connecticut, in conjunction with the members of our industry in the other 47 States of the Union, feel that we must most strenuously object to such a tax as unjust, discriminatory, out of proportion, ruinous to our whole industry, uneconomical, and unprofitable to the Government.

Such a tax would be unjust because, with the exception of the small proportion of manufacturers and bottlers of the few nationally advertised specialty drinks, the great majority of the members of the carbonated-beverage industry own and operate small and medium-sized bottling plants which yield them an income barely large enough for a decent existence. The necessary replacement of worn-out and antiquated machinery, lost and broken bottles and cases, eliminated any surplus profit earned.

In spite of the constantly increasing wages of our employees the price of our product to the consumer has not been raised and the members of our industry would therefore be unable to absorb the proposed tax of 1 cent per bottle, which tax would have to be passed on to the ultimate consumers who are to the greatest extent children and people of medium and small incomes.

The proposed tax is discriminatory because our products have been recognized and classified by the Government authorities as important food products which although not a necessity of life provide the consumer nevertheless with important vitamins, and due to the sugar contents, carbon dioxide, and other ingredients are a substantial aid to the health and well-being of the consumer. They are, therefore, not a luxury as indicated by the proposed tax and should not be singled out from other food products for such a heavy tax burden.

The proposed tax is out of proportion because the biggest proportion of our product is sold for a nickel and a 1-cent tax per bottle would represent 20 percent of the selling price, which rate is considerably higher than that imposed on other products.

The proposed tax would prove ruinous to our industry, because the necessary increased selling price would greatly decrease the consumption of our product and thereby put quite a number of bottling plants, especially the smaller ones, out of business and a great number of employees, especially older men, out of employment. This would also make the proposed tax uneconomical. The Treasury Department figures on a yearly income of $132,500,000 from this tax, but this amount will be greatly reduced by greatly decreased consumption, and other tax sources will be affected by reduced incomes and profits, loss of business, and employment. A similar tax imposed by a few of the States has proved such tax to be uneconomical and unprofitable and expensive to collect and with the exception of one State such a tax on carbonated beverages has been repealed.

Now, the Connecticut manufacturers of carbonated beverages, as well as the members of our industry in the other States of the Union fully realize the wisdom and importance of the defense program as inaugurated by our Government and fully approve thereof. We also realize the necessity of our Government to raise the funds necessary for the execution of such program by taxation and otherwise, and we declare our willingness to fully contribute our just and equal share of the necessary funds, but we must strenously object to be singled out from other food products for such unequitable and unfair tax burden as proposed by the Treasury Department and we appeal to you as one of our Connecticut Representatives in Congress to use all the influence at your disposal to prevent the adoption of aforesaid tax, and if there must be a tax on production sales, to work and vote for a general tax levied on a base sufficiently broad and dis-

tributing the burdens equally by taxing all or substantially all commodity sales at the same rate, thus giving each industry a chance of holding its own, producing the necessary revenue, and bringing the least disruption of this and other industrise in similar practice.

The above statement was approved and adopted unanimously at a meeting of the bottlers of the State of Connecticut held at the Hotel Garde, New Haven, on the 13th day of May 1941.

Most sincerely yours,

THE CONNECTICUT MANUFACTURERS OF CARBONATED BEVERAGES, INC.,
(Signed) OSCAR SILVERMAN, *President.*
(Signed) C. F. G. SCHIRMER, *Secretary.*

The CHAIRMAN. The committee will recess until 2 o'clock.

(Whereupon, at the hour of 12:40 p. m., the committee recessed until 2 p. m. of the same day.)

AFTERNOON SESSION

(The hearing was resumed at 2 p. m., pursuant to recess.)

The CHAIRMAN. The first witness is Mr. Abram F. Myers of the Allied States Association of Motion Picture Distributors.

Mr. MYERS. That is an error; that should be Allied State Association of Motion Picture Exhibitors.

The CHAIRMAN. Exhibitors. All right, sir, you may proceed.

STATEMENT OF ABRAM F. MYERS, WASHINGTON, D. C., REPRESENTING ALLIED STATE ASSOCIATION OF MOTION PICTURE EXHIBITORS

Mr. MYERS. That is an association of independent motion-picture theater owners located in various parts of the United States. The bill as it stands reduces the exemption from payment of admission taxes from 20 cents to 9 cents.

The CHAIRMAN. To 9 cents?

Mr. MYERS. Yes. Our association representing the independent theater owners, did not oppose a general reduction in the exemptions on admissions. In fact, before the House committee we urged that the exemption, so far as it relates to adult admissions, be entirely abolished. Nine cents seems like an arbitrary figure. I never heard of a 9-cent admission, and I can only assume that it was arrived at for purposes of somewhat enabling theaters to continue to charge low admission for children without the payment of a tax. It creates a problem because I am afraid there will be, and my associates are afraid there will be, a tendency in some competitive spots to reduce these 10-cent admissions to 9 cents to evade the payment of the tax and create thereby an unhealthy competitive situation; and so we would suggest to the committee that it reconsider that exemption as it applies to adult admissions, and we hope that the committee will see its way clear to abolish the exemption altogether, so far as it relates to such admissions.

The theater owners I represent also bespeak the consideration of the committee in regard to the more or less standardized 10-cent children's admissions. Children are defined in the Revenue Act as persons under 12, and that standardized admission means that parents are

accustomed to giving the children a dime for the motion-picture show and the imposition of a penny tax means the breaking of another nickel which may not sound like a terrible burden but which actually parents are sometimes reluctant to pay, and in some cases cannot afford. We feel that coupling these two changes together, abolishing the exemption as regards adult admissions and exempting the children's 10-cent admissions, taken together, will not mean any loss of revenue but, on the contrary, will protect the revenue which the bill is designed to raise. That is true, we believe, because in its present form inevitably the children's admissions will go down to 9 cents, and the Government will realize no tax.

We also bespeak the attention of the committee to the definition of coin-operated machines as defined in the act. That definition was rather skillfully drawn to embrace just two categories of coin-operated machines; namely, the so-called pinball machines and the slot machines, which are strictly gambling machines, although the general language refers to entertainment and amusement devices, and it expressly excludes bona fide machines.

Senator GUFFEY. Isn't that what you get out of the slot machine, a little entertainment?

Mr. MYERS. A little experience, I think, because I have heard the percentage being as high as 90 and 10 against the player. There has come into the field in recent times, in the form of coin-operated machines, something known as the movie juke box. It gives a motion-picture program on a screen projected in pretty much the same way that pictures are projected in the theater. Of course, the screen is not so large. That affords competition to the theater, and presumably those who use those machines, patronize those machines, do not go to a motion-picture exhibition and, therefore, do not pay an admission tax. We think that the competition is unfair, because the legitimate motion-picture industry has set up a sort of self-censorship and observes pretty much high standards of decency in its productions. These other productions are practically dedicated to the barroom trade and do not serve any such standard, and we think, possibly selfishly, they should be included in the category of taxed coin-operated machines.

Finally, and here again, while I may be speaking for the protection of our industry, there is also the question of revenue involved. There are a great many so-called free-money movie shows being given in various parts of the country. I might say to Senator La Follette I had a newspaper from Medford which I read, and 3 of the enterprises advertised in that paper offered free movie shows. Well, obviously such patrons do not pay an admission tax. I do not suggest that should be included in the admission tax, but I do think the committee and its staff might give consideration to some form of tax on the amount of compensation received by the man who owns or leases the equipment and who actually gives the show, because it has worked in this fashion. The merchants in a town, or a particular merchant, will engage the owner or lessee of some of this equipment to give a free show in the town to attract people, or will give it in his store to attract customers. Of course, he pays for this show, which is ordinarily given on a 16-millimeter film. I assume that is within the reach of the taxing power.

That is all I have to suggest. The suggestions have been reduced to specific language in the form of a memorandum; and, with the permission of the committee, I would like to file that.

The CHAIRMAN. It may be filed.

(The memorandum referred to is as follows:)

STATEMENT ON REVENUE BILL, H. R. 5417

The following suggestions, relating to the admission tax, are submitted in behalf of Allied States Association of Motion Picture Exhibitors (pt. IV, sec. 541, as introduced in the House):

1. As passed by the House, the bill provides for an admission tax at the rate of 1 cent for each 10 cents or fraction of the amount paid for any admission down to and including 10 cents.

The effect of this is to lower the exemption from the admission tax from 20 cents to 9 cents.

The exhibitors have not opposed reduction of the exemption because they recognize that the Government must increase its revenue.

They feel strongly, however, that the exemption of 9-cent adult admissions is arbitrary and unworkable and may result in some cases in the reduction of adult 10-cent admissions to 9 cents in order to avoid the tax. Also, we have received word that a few drive-in theaters have lowered their admissions to 5 cents, and these should not go untaxed.

We therefore suggest that the Congress abolish altogether the exemption on adult admissions. This can be accomplished by striking from the provision the following words:

"Except that in case the amount paid for admission is less than 10 cents, no tax shall be imposed."

This amendment will not affect the special provision in reference to municipal officers, children, and soldiers, sailors, etc., in uniform.

2. The exhibitors also would like to see children's 10-cent admissions exempted from the tax.

Apparently it was in deference to children's admissions that the House fixed the exemption at 9 cents.

Children's admissions in the neighborhood and small-town theaters are more or less stabilized at 10 cents. Under the bill these will be subject to a 1-cent tax, making the admission 11 cents. This will mean the breaking of another nickel which parents are often unable to afford. Therefore, under the bill, the theaters will have to absorb a penny and cut the admissions to 9 cents, and the Government will derive no revenue therefrom.

Therefore, little or no loss to the Government would be involved in exempting children's 10-cent admissions. On the contrary, coupling such an amendment with the total abolition of the exemption on adult admissions would protect the revenue.

The exemption would apply only to children under 12 years of age.

This suggestion can be made effective by inserting in lieu of the language to be stricken under our first proposal, the following:

"Except that in the case of admissions of children under 12 years of age of 10 cents or less, no tax shall be imposed"—

and by striking from the parentheses in the most succeeding sentnce the words "children under 12 years of age."

3. The debate in the House of Representatives casts doubt on whether the definition of coin-operated amusement and gaming devices (pt. IX, sec. 3267, House committee print) is broad enough to include coin-operated motion-picture machines.

These machines, mostly located in taverns, barrooms, and resorts, exhibit motion pictures on a small screen and are, strictly speaking, motion-picture shows.

They not only compete with theaters, but compete unfairly, since the legitimate-motion-picture industry, through the Breen Board in Hollywood, censors its own pictures and observes standards of decency.

This new juke-box industry observes no such standards, and its films are obviously dedicated to the barroom trade.

The movie juke boxes are no more bona fide vending machines than are the pinball and slot machines specifically described in the bill.

The legitimate exhibitors feel strongly that these juke boxes should be subject to an amusement tax.

Accordingly, they suggest that the first category in the definition should be described as follows:

"(1) So-called pin ball, motion picture, and other similar amusement machines, operated by means of the insertion of a coin, token, or similar object."

4. Finally, the exhibitors feel that to round out the system of amusement taxes and to protect the revenue, the bill should include a provision for taxing free motion-picture exhibitions.

The free shows are operated in this manner:

An itinerant exhibitor owning or leasing a projecting machine, sound apparatus, and some film (usually quite old) will arrange with the merchants in a town, or with an individual merchant, to give a free show as an advertising device to attract people into the town or into a particular store, tavern, or eating place.

These free shows compete directly and seriously with the theaters and tend to cut attendance thereat and consequently to reduce the Government's yield from the admission tax.

The exhibitors suggest that a tax of 10 percent be imposed on the amount of the compensation received by such itinerant exhibitors for staking such exhibitions. This could be accomplished by inserting at an appropriate place, possibly in the section relating to cabarets, roof gardens, etc. (pt. IV, sec. 542, House print), the following:

"Every person owning or leasing motion-picture equipment who shall exhibit motion pictures publicly for or on account of others, at which exhibition no admission fee is charged, shall pay a tax equal to 10 percent of the total amount received for the giving of such exhibition from the person for whom or on whose account the exhibition was held."

Senator LA FOLLETTE. May I ask this question: What has been the tendency of movie attendance? Is it climbing or static or what?

Mr. MYERS. Beginning last winter there was a very decided falling off, and that continues to the present time, and I think from the inquiries I have made in the various parts of the country that it is due in part to the dislocation of people moving from one place to another to take jobs; working on shifts has a great deal to do with it; and also, with more money in their pockets, the people can afford other types of entertainment denied them a long time, and of course, even during the depression, everyone could afford a movie. However, we are hopeful that will pick up with the new pictures coming out in the fall.

The CHAIRMAN. Very well, Mr. Myers. Thank you very much.

STATEMENT OF MRS. JOAN DAVID, WASHINGTON, D. C., REPRESENTING THE NATIONAL LEAGUE OF WOMEN SHOPPERS

Senator GEORGE. Give your name, please, to the stenographer. You may have a seat, if you so desire.

Mrs. DAVID. My name is Joan David, and I am speaking for the National League of Women Shoppers. This group is a national consumers' organization, with branches from coast to coast.

The purposes and activities of our organization have always been directed toward improving the American standard of living. We have worked chiefly to raise wage standards through the use of our buying power, and our efforts have expanded to include attempts to keep down the rising cost of living, since this now seems the major danger to American living standards.

We are interested in the tax bill now before Congress because we realize the effect it will have on the health and welfare of America's millions of low-income families. We realize that the enormous cost of defense has to be paid for out of taxes. But we are alarmed at the

trend of the tax discussion so far. The bill, as it now stands, does not, in our opinion, follow the principle laid down by President Roosevelt when he said:

> It is our duty to see that the burden is equitably distributed according to ability to pay so that a few do not gain from the sacrifices of the many.

On the contrary, under this bill the consumer, through commodity taxes, and the low-income groups, through lowered income-tax exemptions, will bear the greater part of the defense program.

It is misleading to talk about the "90 percent of our people who don't pay taxes." This group is already paying heavy taxes, mostly hidden consumer taxes. The Temporary National Economic Committee, in its Monograph No. 3, entitled "Who Pays the Taxes," shows that the group earning less than $500 a year in 1938–39 paid 22 percent of its total income in taxes. The income group earning from $500 to $3,000 a year paid about 18 percent in taxes. And the group earning between $3,000 and $10,000 paid out about 17.5 percent.

Altogether, the groups earning less than $3,000 a year paid 59.5 percent of all taxes. This disproportionate burden on the groups least able to pay increased throughout the past decade. In 1930, about 60 percent of Federal taxes came from income and corporate taxes and about 40 percent from consumer taxes. By 1940 the figures had been reversed, with consumers paying over 60 percent of the total.

The League of Women Shoppers agrees on the necessity for the raising of revenue for the defense program, and we believe that everyone should participate in the sacrifices necessary for this effort. We do not believe, however, that the poor, millions of whom are already living below the danger line, should be required to pay more until our present tax structure has been adjusted so as to strike at those best able to pay.

We are not tax experts in any sense of the word. But we have studied the situation enough to bring before you certain recommendations which we believe are in the interests of the great majority of the people of our country and in the interests of the defense program.

1. *On the excess-profits tax.*—We see that in the last war excess profits were taxed on the basis of invested capital only. This tax raised 2½ billion dollars in 1918. In spite of this, nearly 18,000 new millionaires paid income taxes in 1918.

Today corporations can figure their normal profits either as 8 percent of their invested capital or as 95 percent of the average profit they made from 1936–39. This allows companies which were making large profits during those years to continue to make such enormous profits indefinitely and never pay any excess-profits tax.

We believe that Congress should follow the example of the last war and tax on the basis of invested capital only. If 2½ billion dollars was raised then, surely far more than that could be expected now. A strong excess-profits tax should be the heart of any good tax bill.

We agree with Federal Reserve Board Chairman Marriner Eccles, when he said:

> The first source of defense revenue should be the corporation tax and excess-profits tax, because, generally speaking, corporations are the greatest beneficiaries, directly and indirectly, from defense expenditures.

And yet, according to the Treasury Department, "the law we call an excess-profits tax does not tax excess profits at all." We wish to urge this committee to investigate thoroughly all possibilities of making the excess-profits tax one of the big sources of revenue for the defense program.

2. We approve, as a step in the right direction, the 6-percent surtax on corporate income. We would like to have the committee investigate the possibility of raising this surtax, since there seems to be some evidence of the ability of the corporations to pay more, on the basis of profits they are now making.

3. We believe that the income from all Government securities, issued in the past or present, should be taxed. We approve the fact that the Government issues no more tax-exempt bonds, but we believe that those issued in the past should be taxed, since their interest makes up a large part of the income of many wealthy persons, as well as banks and corporations, who could and should be paying taxes on them.

4. We know that the Government loses considerable revenue each year through tax evasion. We urge this committee to give special attention to methods of plugging up all loopholes which permit tax evasion.

We were very interested in Secretary Morgenthau's proposal of a simplified income-tax form. While this was apparently designed for the small-income groups, we believe that such a simplified form for all incomes could be devised. This would remove present possibilities of manipulation which so often end in tax evasion. We urge the committee to carefully consider this proposal.

5. We urge a single tax with a rising rate to cover any transfer of wealth—either by gift, inheritance, or insurance. A wealthy man today can give $40,000 to his heirs, leave another $40,000 worth of insurance, and still another $40,000 in his will, before incurring any taxes whatever.

We agree with President Roosevelt's statement that—

> The transmission from generation to generation of vast fortunes by will, inheritance, or gift is not consistent with the ideals of the American people.

We believe, with Mr. Eccles, that a total of $40,000 should be the maximum untaxed transfer of wealth.

6. We urge the committee to investigate the income taxes in the higher brackets. While the rates on these incomes seem high at first glance, we must consider the actual money incomes left to those individuals after all taxes have been paid.

For example, if a man with a million-dollar income paid his full tax down to the last penny, he would still have, roughly, $250,000 left.

This is equivalent to the combined incomes of more than 200 average families. It seems reasonable that some part of such an amount should also be taxed if defense sacrifices are to be widely spread.

Lastly, and particularly significant in view of the recent deluge of adverse comment, we urge that the committee restore the proposed joint tax return requirement.

One of the best-known methods of avoiding the payment of full tax rates is the filing of separate returns by wealthy husbands and

wives. We believe that such families should be required to file a single joint tax return. We feel that exemption might be made for families making less than $5,000, because of the added household expenses when the wife is working. We do not believe that such a law would in any way affect the independence or rights of women. We don't anticipate any broken families. We believe that most married women who live on and enjoy a joint income are willing to contribute to the necessities of the defense effort on the basis of that joint income.

Let me repeat that the League of Women Shoppers realizes the urgency of increased taxation in this time of emergency. We are, however, firmly convinced that a decent standard of living for our citizens is one of the most vital factors in national defense.

Our objection to this tax bill as it now stands is that it does not consider this real problem—the danger of further lowering American living standards. We grant that at some future time such drastic action may become necessary. But we believe that at present there is no valid reason for Congress to impose heavy taxes on low-income groups and consumers while all the possibilities we have outlined for shifting the tax burden to those able to pay remain unexploited.

We wish to urge this committee to investigate all the possibilities for increased revenue which we have briefly outlined. Unless this is done, the heavy, unfair, and, at present, unnecessary sacrifices imposed on the low-income groups will be inevitably reflected in the health of the people—and will constitute a major blow to the ability of the Nation to defend itself.

We are grateful to this committee for granting us the opportunity to present our views on this bill.

The CHAIRMAN. Thank you very much.

Senator DANAHER. What is the League of Women Shoppers, Mrs. David?

Mrs. DAVID. Well, it is a group of women, well-educated, many of them business and professional women. I would guess in reference to joint tax returns, that 90 percent of them are married. Most of us are people with a little time to spare. We meet together in discussion groups. The group itself divides into several committees: Education, labor, housing—mostly public-interest affairs.

Senator DANAHER. Is this league incorporated?

Mrs. DAVID. Yes.

Senator DANAHER. Where is it incorporated?

Mrs. DAVID. I believe in New York; that is where the national headquarters are.

Senator DANAHER. How many members are in the league?

Mrs. DAVID. I don't know the national membership; there are over 400 members in Washington. The league has branches in 10 States and the District of Columbia.

Senator DANAHER. Does it have an executive committee?

Mrs. DAVID. Yes.

Senator DANAHER. Who selects that?

Mrs. DAVID. They are voted on by representatives of the various branches of the league.

Senator DANAHER. And did the executive committee participate in the preparation of this statement?

Mrs. DAVID. The executive committee, as I understand it—through representatives from that committee known as the emergency committee—prepared and provided the statement and it was then sent to each of the branches and approved by them.

Senator DANAHER. And how were you selected to come here?

Mrs. DAVID. The statement was to be presented by a member from New York who was unable to get down for the occasion and I guess I happened to be the one member in Washington who was able to come here.

Senator TAFT. Who are the officers of the league?

Mrs. DAVID. I have a letterhead here that shows the names of the officers.

The officers are honorary president, Aline Davis Hays; president, Sophia Ames Boyer; vice presidents, Mrs. Sherwood Anderson, Nina P. Collier, Fannie Cook, Marion Hathway, and Lillian Hellman; secretary, Iris Winsor; and treasurer, Freda Sternberg.

The sponsors are Mary C. Baker, Mrs. William A. Douglas, Dorothy Canfield Fisher, Lucile Webster Gleason, Inez Hays Irwin, Freda Kirchwey, Dorothy Parker, Cornelia Bryce Pinchot, Mrs. Carl Sandburg, Gale Sondergaard, Mrs. Stephen S. Wise, and Mary E. Woolley.

Senator TAFT. Who made that study as to the relative tax burdens to which you referred?

Mrs. DAVID. I think most of that was derived from a report by the T. N. E. C. I wasn't present at the drafting of the report, but, as I understand it, most of the figures were secured from that report.

Senator LA FOLLETTE. They have a monograph on that, a study of it?

Mrs. DAVID. It is called Who Pays the Taxes.

The CHAIRMAN. Any further questions?

(No response.)

STATEMENT OF JAMES F. STILES, JR., NORTH CHICAGO, ILL., VICE PRESIDENT AND TREASURER, ABBOTT LABORATORIES

The CHAIRMAN. Mr. Stiles, you are the vice president and treasurer of Abbott Laboratories?

Mr. STILES. Yes.

The CHAIRMAN. You wish to address yourself to the question of——

Mr. STILES. The normal tax and excess-profits tax of corporations.

The CHAIRMAN. All right, Mr. Stiles, we will be glad to hear you. You can be seated or stand.

Mr. STILES. I have been seated, Senator; I will stand, and confine my remarks to this little paper. I think the clerk has submitted copies of it to all the members, and we can read it together.

I welcome the opportunity to appear before this committee to express my appreciation of your action in amending the second Revenue Act of 1940 by the passage of H. R. 3531 last March, known as the special relief bill. Your cooperation in the preparation of that amendment was, in my opinion, one of the most constructive acts of your committee, and its retention is without doubt most essential to the existence of hundreds of growing companies all over this country.

I am convinced that, while it is necessary for Congress to levy and for all of us to pay all the taxes that can be raised, it is not your intention to tax normal profits of any company as excess profits, when it is possible to determine what are excess profits.

For this reason I am appearing on behalf of my company and many other companies similarly situated to present a problem which I hope will receive your earnest attention. I also wish to propose a solution which I believe is simple, equitable, and necessary.

The problem is how to determine fairly the normal profits of a growing corporation. Under the present law, as amended last March, a formula was adopted which recognizes normal growth during the base period. But there is no recognition in the law of the fact that normal, reasonable growth may and should continue after the base period.

Every growing organization today must, through constant research and development work, discover better means of making new and more useful consumer goods, which must be sold for less money if it expects to keep on growing. Such companies form the backbone of our normal peacetime economy. Their discoveries during the past have made, and in time to come will continue to make, our country outstanding in the world in that respect.

If such growth companies by reason of their research are able to contribute to the economic welfare of our Nation, and in so doing increase not only their profit but their pay roll, then I believe you will agree with me that at least that increase in profit which bears the same relationship to their pay roll as their normal profit bore to their pay roll during the base period is and can be justly called normal profits.

I therefore submit to you for your consideration the following simple formula for determining normal profits of a growing company:

Determine the average ratio during the base period of pay roll (subject to social-security taxes) to net profit (net income after deduction of normal tax, or to the profit before normal tax depending on how the law is finally written) and use such ratio to determine the base credit for normal profits in each subsequent year, for example—

Gentlemen, you have all the formula there in front of you and I really see no reason for going into these figures. I would ask, however, that they be copied in the record.

The CHAIRMAN. Yes; that will be done.

(The table referred to follows:)

Year	Pay roll subject to social-security tax	Net profit after normal tax	Profit before normal tax
1936	$1,000,000	$600,000	$705,882
1937	1,500,000	900,000	1,058,823
1938	1,400,000	800,000	987,654
1939	2,100,000	1,200,000	1,481,481
Total	6,000,000	[1] 3,500,000	[2] 4,233,840
	Example of application for current year		
1941	$3,275,000	$2,500,000	[3] $3,289,473
Less pay roll on defense contracts or subcontracts	275,000		
	3,000,000		
Base credit for current year		[4] 1,750,000	[5] 2,116,920
Amount subject to excess-profit tax		750,000	1,172,553

[1] Which is 58.33⅓ percent of pay roll, column 1.
[2] Which is 70.564 percent of pay roll, column 1.
[3] Figures used are based on 24 percent. Normal tax.
[4] 58⅓ percent of column 1. ($3,000,000.)
[5] 70.564 percent of pay roll column 1. ($3,000,000.)

If the ratio of pay roll subject to social-security tax, during the base period, is used as a yardstick for the current year, then when you deduct pay roll used on defense contracts, or subcontracts, you automatically make all profit on such contracts subject to the excess-profits tax.

Mr. STILES. Now, the $3,500,000 net profit after normal tax is 58 and a fraction percent of pay roll subject to social-security tax, whereas profit before normal tax is $4,233,840 or 70.654 percent. The example for the current year assumes pay roll is $3,275,000. The net profit after normal tax, $2,500,000, and profit before normal tax, $3,289,473.

I have suggested that you take out the amount of pay roll paid on defense projects and apply to that balance of $3,000,000 the ratios sustained during the base period.

Senator CONNALLY. Why do you adopt that standard pay roll subject to social-security tax?

Mr. STILES. Because, sir, after applying various ways of arriving at a formula, I found that by the use of pay roll, subject to social-security tax, a taxpayer cannot inflate his excess-profits credit through the payment of large salaries to officers or a restricted group of high-paid employees, and reports showing pay roll, subject to social-security tax, are already on file both in the Treasury Department and the taxpayers' records giving the necessary information.

In presenting this formula for determining normal profits in a growing company, I desire to make very clear the following:

(1) It is not offered as a substitute for any of the present methods but as an additional provision or yardstick.

(2) It is not offered as a panacea for all difficulties nor do I presume to say it is the only method. It is a simple, logical, and fair one. In fact, its very simplicity makes it a desirable alternative both from the standpoint of the taxpayer and the Treasury Department.

(3) I do believe its adoption will definitely encourage those companies, whose pay roll in the lower brackets expands as they grow, to keep on growing—and thus they will pay more normal tax plus

excess-profits tax if their net profit, after normal tax or profit before tax, depending on how the law is written, increases faster than their pay roll.

(4) If adopted as an additional alternative, I believe it will very definitely be an incentive to cooperation in increasing employment, stimulate research and development work, and thereby strengthen our national industrial relationships.

(5) Its simplicity makes it easily understood and at the same time it can be applied to thousands of organizations which operated at a profit during the base period, each one of which might have a different relationship between pay roll (subject to social-security tax) and net profits (after normal tax), depending on many factors peculiar to their own business.

(6) I believe that growing organizations will play a vital part in the economic readjustment which must take place after the defense spending is discontinued. The knowledge they acquire by continuous research and development work, as well as the steady employment and normal profits which will arise by new discoveries, will not only help to pay the defense bill but put us in a position as a Nation to meet competition in the new world relationships which will arise after this conflict is over. Certainly we need, Senator, not and must not stop all present development and postpone all progress until the emergency is over.

Senator CONNALLY. Nobody proposes to do that that I have heard.

Mr. STILES. All this formula does is to use the average earnings method with pay roll (up to $3,000 annual salary per employee) as a common denominator. It says to everyone of us:

> If you are a growing corporation, if your nondefense business and your profits increase, and if at the same time your pay roll increases in the same proportion, then your growth is normal, the kind we wish to permit and encourage, and your profits will correspondingly be considered normal.

It does not interfere with the defense program but it does encourage industries to keep on growing and to find new ways to replace materials now needed for defense. It rewards them for putting men to work—which will be the real problem when the defense spending stops.

The success, nay even the preservation, of our entire economic system will depend on what we can and will do after this great struggle is over.

I have suggested that "this option should not apply to any part of a corporation's profits arising directly out of defense contracts or subcontracts." In making this suggestion I had no thought of profiting by increased employment due directly to defense spending.

The idea that capital alone makes profit is fundamentally wrong. Only when capital employs human effort or when it is loaned to an enterprise which employs human effort is economic value created and profits accrue to the investor. Therefore, pay roll, the basis for compensating the producer of economic wealth, related to the net value of what he creates (profits) is to my way of thinking a practical, simple yardstick for measuring normal profits.

When you consider placing increased tax burden on well-managed growing corporations, I urge you to weigh carefully these simple facts.

While the corporation is in fact a legal entity, it is in reality an American institution. It has fundamentally two major functions—

(*a*) To provide the mechanism by which economic wealth is created and distributed.

(*b*) To redistribute the economic purchasing power in the form of wages and dividends.

Every tax placed upon a corporation must interfere with these functions. A well-managed growing corporation bears the same relationship to the economic welfare of its customers, employees, and stockholders, as the hospital does to the physical welfare of the community, and churches and schools to our spiritual and mental development. Therefore, when taxes become the major burden on the institution which creates national wealth and income, we not only restrict but penalize the production of the very thing we must have for taxes.

Such a burden slows down progress and may even break down the internal mechanisms which are necessary for their continuation.

I do not contend that the Government should not tax corporations in time of emergency to the very limit of their ability to pay. But a normal tax of 25 to 30 percent plus a penalty tax up to 50 percent is beyond the safety point unless the application of such tax is based upon some relation to or measure of the normal functions of the corporation.

I realize we are in a period of great international difficulty; a period when every citizen of our beloved country should be willing to make many personal sacrifices; a period when our every act should promote cooperation, create confidence, and inspire courage. It takes all three of these elements to operate successfully a growing business during normal times.

I realize that to meet this defense program, you must of necessity raise sums of money far greater than any one of us, as individuals, can comprehend. Under our present tax laws you are depending on private enterprise to provide a large portion of this sum. It is essential, therefore, that private enterprise must continue to remain in a position where it can create and distribute an ever-increasing amount of economic wealth and national income. I urge you, therefore, in preparing the final draft of this measure to give serious consideration to the necessity of providing a yardstick, which will permit growing organizations to keep on growing.

Finally, gentlemen, as citizens, we must rest this matter in your hands with confidence that you and all members of Congress, as business directors of our country, will be exemplary in all matters of appropriation for nondefense activities; allowing economy to be your watchword, and always remembering that every dollar of needless expenditure raises our outstanding indebtedness, increases the need for more taxes, and may be the spark which will start an economic conflagration. Thus, by your example, you will encourage our free enterprises to continue their progress in raising our economic standard of living. Let our Government establish a defense which in every sense of the word will defend our American way of life, and together we will build a Nation where no foreign "ism" will ever arise, and by the benefit of constructive, or may I say, incentive legislation confidence will be created and courage will inspire every heart.

Mr. STILES. That is correct, Senator. If you will refer to the third paragraph on the first page, I tried to cover that in stating that the problem is how to determine fairly, normal profit. Under the present law amended last March, a formula was adopted which recognizes normal growth during the base period, but there is no recognition in the present law that normal, reasonable growth may and should continue after the base period.

The CHAIRMAN. That is right. You are undoubtedly putting your hands on the evil in the excess-profits tax. It doesn't make any difference whether we agree with you or not as to this particular matter, but if you are going to stop progress and growth, the result will soon become evident. It is on the same theory as the tax on estates. If you continue to tax estates we won't be getting anything from the estate tax in 25 years. You have to have some reason in the law.

As I interpret your formula, it is intended as a relief to those, what you might call, rapidly growing or developing companies not covered fully under the growth formula, which the Treasury did work out in the second bill in 1940.

Mr. STILES. Senator, you have said it better than I could.

The CHAIRMAN. Of course, the problem in all excess-profits tax is first, to determine what are excess profits. If you are going to do it arbitrarily, you haven't gotten anything but simply a legislative statement which might have no relation to the fact of what is or is not excess profits. That is the problem and, in any true excess profits, it would have to be worked out with respect to every business. That is your concept, isn't it?

Mr. STILES. Yes.

The CHAIRMAN. And since you cannot work it out, specially for every business, you have cases that are most unjustly dealt with under most any general formula you have for determining the normal tax as distinguished from the excess profits; and I personally think that there is much in your suggestion here, if it could be worked out and practically applied, because you don't propose to change any rates in the bill; you are not concerned with that?

Mr. STILES. No, sir. We are paying just what you gentlemen decide. I am not objecting to anything. I am merely trying to suggest a simple formula for arriving at a fair basis for tax.

The CHAIRMAN. But suggesting a possible way of relieving that particular class of corporations who have not been as much helped as others.

Mr. STILES. Yes; you might be interested in knowing that I have received over 4,000 unsolicited letters, all urging that I present this thought to this committee and to the Ways and Means Committee. It has taken much of my time answering those letters. I have brought them down here; I didn't want to introduce personal letters before the committee, but they are here available.

The CHAIRMAN. Thank you.

Senator CONNALLY. Are you selling any of your pharmaceutical products to the Army?

Mr. STILES. Yes.

Senator CONNALLY. You sold more this year than last year?

Mr. STILES. Yes.

Senator CONNALLY. You sell to veterans' hospitals?

Mr. STILES. Yes.

Senator CONNALLY. And you have been doing that for a good many years?

Mr. STILES. Yes.

Senator CONNALLY. You have been selling the Army a good deal more this year than last, have you not?

Mr. STILES. I wish we could sell them more, but, in some way or other, they only use a few of our products. I wish I knew how to sell them more, but, up to the present time, we have not sold them so much. We specialize in antiseptics, anesthetics, and hypnotics——

Senator CONNALLY (interposing). Hypnotics?

Mr. STILES. Yes.

Senator CONNALLY. You have been trying to practice that here today.

Mr. STILES. You are very complimentary to me here today. I wish I were able to do as well as you can.

Senator DANAHER. Does your company produce Abbott's Bitters?

Mr. STILES. No. We have nothing bitter about our company.

Senator DANAHER. Not even experience?

Mr. STILES. No; it has been a real pleasure to be here. I enjoyed coming here very much.

Senator TAFT. Couldn't we accomplish something of the same sort by adjusting the base period every 2 years?

Mr. STILES. You might be able to accomplish very much in that manner. Your action on the Davidson suggestion, which you adopted last March, was most constructive, and I am absolutely sincere when I say that. Senator Vandenberg knows that I complimented members of the Treasury Department for what they did in that matter. However, it still leaves a ceiling over any future progress. I have had various people say, "Why hire any more fellows; why build or add to a plant?" referring to the fact that, if they do, the increase in earnings will all go in taxation.

Senator CONNALLY. Not all.

Mr. STILES. Well, I just told you, 95 percent in our case for the first 6 months of this year.

Senator CONNALLY. That is because you are in the higher brackets and making so much.

Mr. STILES. That is very complimentary; you are very kind to me.

Senator CONNALLY. Those are excess profits.

Mr. STILES. Well, we will be in the higher brackets under the pending legislation.

The CHAIRMAN. Thank you.

STATEMENT OF RALPH HETZEL, JR., WASHINGTON, D. C., REPRESENTING THE CONGRESS OF INDUSTRIAL ORGANIZATIONS

The CHAIRMAN. Do you wish to file the brief for the record, or read parts of it?

Mr. HETZEL. I would like to read portions of it.

The CHAIRMAN. You may put the whole brief in.

Mr. HETZEL. I know that President Murray would have liked to have been here representing the C. I. O., but his doctor has required him to rest.

I thank you, gentlemen.

Senator CONNALLY. What does your company manufacture—make?

Mr. STILES. Pharmaceutical supplies.

Senator CONNALLY. A general line?

Mr. STILES. Yes.

Senator CONNALLY. During the past 4 years, this base period, has your business increased?

Mr. STILES. Steadily That is the reason we appreciate your action in amending the Second Revenue Act of 1940.

Senator CONNALLY. If you should choose the base period of the 4 years, as set out in the bill of last year, you would get a very good allowance, would you not?

Mr. STILES. Senator, may I give you an example of the first 6 months? Our taxes were 95 percent of our increasing earnings in the first 6 months of 1941 as compared with the first 6 months of 1940. Under the present revenue act, 95 percent of our increased earnings are represented in taxes.

Senator CONNALLY. How much increase was that; what percentage of increase? You made a very large increase in profit over the same period?

Mr. STILES. I think our profits show an increase in 1941 over 1940.

Senator CONNALLY. That is right. How much?

Mr. STILES. They increased approximately in the same proportion of our sales, or about 15 percent. Isn't that true? May I ask my associate?

Senator CONNALLY. Yes.

Mr. STILES. About 15 percent.

Senator CONNALLY. Of course, the emergency, the increased business due to the boom had nothing to do with it.

Mr. STILES. I should say it had something indirectly to do with it.

Senator CONNALLY. Just because you don't make cranks or bullets does not mean you have not shared in the demand for goods. There is no question but what you have been helped by this thing.

Mr. STILES. There is no question about that.

Senator CONNALLY. These Army camps are located all over the country and every merchant, within reach of them, derives some beenfit as a result. He is helped; everyone is. Your company made 15 percent more, you say in 1941 over 1940.

Mr. STILES. But we have done that every year for the past 8 years. We have steadily increased from 15 to 17 percent.

Senator CONNALLY. Then you are all the more able to pay some taxes.

Mr. STILES. I am not complaining about the tax; I am trying to suggest a constructive method of applying it.

Senator CONNALLY. But you state you feel you should not penalize a growing and prosperous business.

Mr. STILES. Well, do you think we should?

Senator CONNALLY. Well, how about one that is not growing and so prosperous?

Mr. STILES. Do you think we should penalize one that is?

Senator CONNALLY. You are not being penalized. If you pay your taxes, that is not penalizing you. We have to carry out this program and to procure the money to do it, we have to collect taxes.

Mr. STILES. I am not talking about the amount of taxes. I am trying to talk about the method of allocating them.

Senator CONNALLY. You are calling this 15-percent increase a normal increase? It is not normal because it is 15 percent more than you have ever made in your life.

Mr. STILES. We are growing, the same as we have been; that is all.

Senator CONNALLY. Yes; you are growing because you have opportunity here for your ingenuity and your salesmanship.

Senator TAFT. And other companies have been going down because they didn't have that ability for success in their business.

Mr. STILES. We are working hard; our business is growing as a result of it.

Senator CONNALLY. I understand, from the energy you have displayed here, how you did it.

Senator LA FOLLETTE. How would this alternative method affect higher incomes?

Mr. STILES. How would it affect them?

Senator LA FOLLETTE. Yes.

Mr. STILES. It would have no affect on higher incomes nor would the total amount of higher incomes affect the base credit of any corporation which would benefit by this formula. That is one of the reasons for suggesting pay roll subject to social-security tax (the first $3,000 paid any employee during a taxable year) as the common denominator between the base period and the current year.

Senator LA FOLLETTE. Take your own company and apply this alternative you suggested; would you pay more or less tax?

Mr. STILES. If we employed more people in the lower bracket, we would pay less tax.

Senator LA FOLLETTE. Suppose this thing went into effect now, and you took advantage of this alternative method; how would it affect the total amount of taxes the Abbott Co. pays to the Treasury; would it increase or decrease that amount?

Mr. STILES. Frankly, I should say it would have a decreasing effect. I haven't applied this formula to our current earnings, so I cannot tell you exactly.

Senator LA FOLLETTE. What effect would it ultimately have on revenue?

Mr. STILES. I believe it will stimulate increased employment and activities in business.

Senator LA FOLLETTE. But we may not be able to wait for that. What effect would it have if we let it be applied to this calendar year? Would it be more or less money for the treasury?

Mr. STILES. I can't even hazard a guess.

Mr. Stam is probably better able to say that than I would be.

The CHAIRMAN. What you are suggesting is really a relief measure, a specific relief proposal for rapidly developing growing companies.

Mr. STILES. Yes; other than those developed as a result of defense spending.

The CHAIRMAN. Yes; you exempted those. In the supplement of the second Revenue Act of 1940, to which you referred, we did try to work out the growth formula, which does help. It is a relief measure in some situations.

Senator BARKLEY. Will you state for the record your position with the C. I. O.?

Mr. HETZEL. I am director of the economic division, C. I. O. headquarters.

Mr. Chairman, we recognize the pressing difficulties before the committee and the spirit in which we come here is to be constructive and helpful.

The new tax bill, as passed by the House of Representatives, fails to meet labor's specifications for sound taxation in many respects. As President Murray pointed out in testimony before the Ways and Means Committee, the present tax system, to say nothing of State and local taxation, rests with undue heaviness upon the wage earners, farmers, and other working people. Thus, the already heavy burden resting upon the low-income consumers would be increased, not lightened.

The effect of this tax bill upon the general character of the Federal tax system can be seen in part by the fact that the current tax bill adds a tax system composed of less than three-fourths of ability-to-pay taxes and more than one-fourth consumption taxes to a Federal tax system which was already composed of 54-percent-consumption taxes and 46 percent ability to pay.

Therefore, though the percentage of ability-to-pay taxes in the whole Federal structure will be improved by this bill, the weight of taxation upon consumption has substantially increased. Where this tax on consumption rests on wage earners' income, it means more wage cuts and less wages than before.

The C. I. O. proposals.—President Murray in his testimony before the House Ways and Means Committee set forward three principles to improve the Federal tax system. They were:

1. Repeal of all excise and sales taxes which bear upon working people's incomes, those incomes below $2,500 for married couples and $1,000 for single persons. No additional sales taxes or excise taxes should be enacted.
2. Income-tax exemptions should be returned to $2,500 and $1,000 and no income taxes should be laid below that level.
3. All new tax income should at this time be collected from increased taxes on high individual incomes, estates, and growing corporation profits. These include taxes on excess profits, undivided profits, tax-exempt securities, and inheritances.

On the basis of these proposals, the C. I. O. is emphatically opposed to the suggestions that personal income-tax exemptions must be lowered and that more extensive excise taxes be imposed.

We urge that the committee restore the mandatory joint return. The inclusion of this measure would close one of the most serious loopholes in the progressive income-tax structure.

Senator CONNALLY. In other words, you favor the proposition that if a man is working and his wife is also working, both of them earning income, that on that they be permitted to file surplus returns; is that it?

Mr. HETZEL. As in the House bill, or as suggested by the President, with some allowance for earned income.

Senator CONNALLY. You want the earned income exempted but not the other? Now I ask you if you favor putting them in a joint return and paying on that one where a man works and his wife also works?

Mr. HETZEL. We would be perfectly willing to accept the position of the Treasury on that.

Senator BARKLEY. In the case suggested by Senator Connally where both husband and wife are working and earning income and are required to make a joint return by which they would pay more taxes than the two separately would pay, that likewise reduces their compensation for work to that extent, does it not?

Mr. HETZEL. As I understand it, yes; to a certain degree. However, the report of the House committee said it would not on joint incomes below $4,000 and if the general income exemption suggested in this memorandum would apply that exemption would be substantially higher and I don't believe that cutting into incomes in those levels would be very serious, even though it is earned income.

As this paragraph says, the inclusion of the measure would close one of the most serious loopholes in the income tax structure. After all, the most extensive use and abuse of the returns has been in the highest brackets. So far as I know, it has not been a serious matter in the lower brackets. It would collect revenue, as the committee well knows, in the higher-income brackets and among persons who can well afford to pay. To allow this bill to be passed without this provision will be a shocking defeat for an effective tax policy.

It is the sincere contention of the C. I. O. that whatever additional revenues may be necessary can be collected on the ability-to-pay basis from higher taxes on the large individual incomes, estates, and extensive corporation profits.

Sales and excise taxes.—The House bill fails to improve the Federal sales or excise-tax situation. As a matter of fact, it adds a number of new taxes which will bear upon working people, such as the $5 tax on every automobile, additional taxes on tires and tubes, matches, soft drinks, and such.

The C. I. O. urges the reduction, rather than the extension of Federal sales taxes. It is well known that sales taxes bear with unequal heaviness upon the low-income groups. As President Murray's testimony pointed out to the House committee, in the last 10 years the burden of Federal taxation upon the working people has grown heavier in size and proportion. It is a shocking record. In 1930, for example, approximately 68 percent of all Federal tax income was raised by taxes on individual income, corporations, inheritance, and gifts, while about 32 percent came from consumption taxes, excise or sales. In 1940 the percent of taxes coming from the income, corporation, and other progressive taxes fell to 46.3 percent, while taxes bearing primarily on consumption, that is, sales and wage taxes, rose 53.7 percent.

Senator BARKLEY. Do you include in that figure the social-security figures?

Mr. HETZEL. Yes.

Senator BARKLEY. Ought that really to be figured? Of course, it is true just as a matter of naked taxation but whatever taxes are levied for social security are levied for the benefit of the workers, and is it really exactly accurate to draw that comparison when considering the subject without attempting to take that fact into consideration?

Mr. HETZEL. The basis of the comparison was the general effect of the tax system upon the income of the low-income groups. Now, as

you know, our position relative to the social-security tax is that an increasingly larger portion of it should come from general revenue.

Senator CONNALLY. More like a pension.

Mr. HETZEL. The point is, it should come from general revenue.

Senator CONNALLY. That is what I said—a pension.

Mr. HETZEL. *Personal income taxes.*—President Murray has taken the position that the C. I. O. will support the most effective possible progressive personal income-tax system. This, in our view, means an income tax which begins not lower than the 1939 exemptions of $1,000 and $2,500. A sound individual income tax is so devised as to be fully and clearly progressive; the effect is both economically sound and just to individuals.

We have proposed the bottom limits of $1,000 for single persons and $2,500 for families because we believe that these annual incomes are an absolute minimum for the decent livelihood of American working people. The budget of the Heller committee for research in social economics showed that in March 1941 a family of 5 in San Francisco required $2,211 as a minimum for health and decency, and that is a very minimum budget. Between the time this budget was priced and June 15 cost of living as a whole has gone up 2.9 percent and food 6.5 percent. These figures are for the city of San Francisco. The cost of living for the country as a whole has advanced even more.

Taxes which strike below these levels of income are, in substance, cuts in the standard of living. For wage earners they mean real wage cuts.

It is labor's sincere belief that a great disservice is done to defense by cutting the standard of living of those who income is already inadequate to furnish them with their basic needs.

Consumption cuts.—The argument is now being made that taxes which bear upon the consumption of wage earners and low-income groups are necessary in order to prevent inflation. This argument is the basis for proposals to spread the income tax to lower income groups and to lay extensive sales taxes, or purchase taxes, as they have been euphemistically called.

It would not be suitable here to engage in an extensive discussion of the inflationary situation. I think it is necessary to say, however, that proposed taxes upon low-income groups would not in the present situation do a great deal to prevent the price rises now imminent. The major effect of such taxation would be to reduce the standard of living, to cut the purchase of materials that are still available in sufficient supply, and to induce resentment among the working people of the country.

According to the latest available C. I. O. estimate, unemployment remains at 6,305,000 for June. It is highly improbable that such unemployment will be reduced by more than one and one-half million during the next year. That is optimistic. If national income is frozen by placing extensive curbs on consumer purchasing power, this and even greater amounts of unemployment will become a permanent feature of the economy, even in a period of enormous defense expenditures. Already Mr. Leon Henderson has suggested that the so-called priorities unemployment, against which the C. I. O. has warned for some time, may cause additional unemployment of at least 2,000,000.

Senator CONNALLY. The morning papers say unemployment was reduced 300,000 during the month.

Senator BARKLEY. What portion of the figure 6,300,000 that you estimate will be still unemployed is made up of unemployables?

Mr. HETZEL. The basis of our calculation doesn't include unemployables in that unemployment. That is, this calculation is made up by subtracting the number of employed from the total working force of people who can work.

Senator BARKLEY. Are there any accurate, dependable figures as to the number of unemployables in the country?

Mr. HETZEL. I don't know of any figures on that; there are some census figures, the details of which I do not know.

Senator BARKLEY. We all know there are a lot of people out of work who cannot work and who could not work before the depression started, and who never can work. They are either ill or crippled or for some reason are unemployed, and in all these estimates of people out of work I have wondered for a long time how many of the number are made up of unemployables for one unfortunate reason or another who couldn't get a job if there was nobody out of work. You have no exact figures. I confess I do not know.

Mr. HETZEL. I doubt if accurate figures could be made on that. A man may be unemployable in certain circumstances. That is, if you give him only 10 days to learn a job or harden himself, he will not be able to work. In another circumstance, if you give him 60 days he may be able to do the job. Again, if an employer will take a man over 45 he is employable; otherwise not.

Senator BARKLEY. The number, of course, is flexible but it would be helpful if there was some way we could find out how many people are not working and how many of them cannot work.

Mr. HETZEL. We have tried to get the Federal Government to make a decent, dependable, continuing classification of unemployment. We would be very glad to get out of the field in a minute if they would do so.

Senator GERRY. Do your figures of unemployed contemplate those completely unemployed?

Mr. HETZEL. Completely unemployed. Our employment figures are those taken from the Department of Labor statistics. As I recall, they require that a person work a specific number of days a week during a specific period to be considered employed.

Senator VANDENBERG. It is a fact that the abrupt curtailment is already causing widespread unemployment and threatening more of it, is it not?

Mr. HETZEL. That is true. We are very much alarmed indeed. We think it a scandal of a major nature that when we are trying to utilize our manpower to the fullest, men are to be put out of work. Automobile workers of the number of 200,000, and other——

Senator VANDENBERG. Workers or refrigerators, washers——

Mr. HETZEL. Yes. Workers in the refrigeration, washing-machine industry, and those engaged in the manufacture of aluminum products, and a great many others—I could go on with a very long list.

Senator VANDENBERG. I suppose the State of Michigan is as much benefited from defense contracts as any State in the Union, and yet in spite of that it is on the verge of a major economic crisis because of the too abrupt and unsound curtailing of priorities and such.

Mr. HETZEL. We agree with you.

Senator VANDENBERG. If this goes on, priorities and curtailment will do more damage to the United States than Mr. Hitler will do the rest of his life.

The CHAIRMAN. We hope.

Senator VANDENBERG. We hope.

Senator BARKLEY. Let me ask you this: If it be true that it is necessary to inaugurate certain priorities in order to get materials for national defense, assuming that must come first, what is the remedy, what can be done to absorb the unemployment that would result by the exercise of these priorities, whether abrupt or curtailed?

Mr. HETZEL. Well, I think that in the past 12 months there has been the most serious and fundamental failure on the part of the persons responsible for production of essential commodities, such as steel and aluminum, and that the only way to meet the necessity of providing a sufficient flow of those materials for the kind of production we are going to have to get our defense materials out and employ our people, requires planning that is far beyond their ability or desire. We have proposed, through President Murray and through our various unions in each of these commodities, what we consider to be concrete, effective plans to speed up the production, in steel and aluminum, for example. The general proposal was for an industry council to be set up in each industry where industry and labor jointly concerned wuld be jointly charged with the responsibility of seeing that the job was done.

Senator BARKLEY. That doesn't answer my question. Let us take the automobile industry in Michigan, about which it has been decided, or at least an effort is being made to curtail production because steel, aluminum, or other materials necessary to make automobiles are needed in making guns, tanks, and airplanes, and things of that sort. Now, let us suppose that is necessary and, of course, you cannot help what has gone on in the past, we are looking now into the future, and granted that somebody in the steel and aluminum business was not very farsighted in preparing for the supply of steel that we might need; and it now turns out that we now have this need. Now, granting that, we face a situation where if it is necessary to curtail production to develop more material, what is the concrete plan by which the man thrown out of his job in the automobile, refrigerator, or any other industry is to be placed in some other job or industry, because that is the only way I know of they can continue to work? What is the concrete situation under which that is to be done?

Mr. HETZEL. Several of our unions, Senator, have made concrete proposals relative to this problem. However, we stick to the basic principle they ought to expand steel, but, specifically, for example, we believe that the cut in the production in the automobile industry can be so leveled out that it is related to the increase in the production of the new plants now in Michigan. If they cut automobiles 50 percent, there will be an hiatus for a considerable period of time during which many men will be unemployed during the transition. If their jobs can be held together until spring, the problem will not be nearly so acute.

Senator BARKLEY. You mean the dislocation ought to be staggered so that workers from one industry which is being curtailed will be

able to take their place in another defense industry as they are relieved?

Mr. HETZEL. That has been done already in Buffalo with the cooperation of the O. P. M. where the Chevrolet plant is shutting down. It requires 6 months to shift to defense work and the men who are to be shifted to this defense work are being prepared to be put into their new jobs. Another proposal is to give them a dismissal pay or subsistence wage. Other proposals are to give the men who have experience seniority. There are other proposals which have to be explored jointly with the industry. It is a joint problem, it seems to me.

Senator BARKLEY. I agree with you. It would have no direct bearing on the question of taxation, but it is an important matter which cannot be ignored.

Senator VANDENBERG. May I just comment in response to your question, Senator Barkley, to this extent? The complaint, as it comes to me, in the seriously affected areas in the Middle West is not against the curtailment per se, but against the abruptness with which major curtailments are made and the summary fashion in which priorities are suddenly precipitated. It takes a little time to integrate a nondefense employment over into a defense operation, but there is no time allowed for the transition. Our people are suddenly confronted with these major restrictions; it is just more than they can assimilate. I completely agree with the witness. My theory is that the domestic dislocation will do our total defense effort severe harm. Now, the effort, it seems to me, ought to be to cushion these curtailments instead of so summarily precipitating them in situations where they cannot be assimilated.

The CHAIRMAN. You gentlemen have discussed this matter interestingly. Will you proceed, Mr. Hetzel?

Senator BARKLEY. I move that ought to be referred to Mr. Knudsen who knows more about that. He comes from Michigan.

Senator VANDENBERG. Well, he is more or less an outsider on it.

Mr. HETZEL. The price rises, outside of the rises in farm products with which the committee is familiar, have come from causes not based in the rising purchasing power of the low-income groups. Important among these causes are:

1. Shortages of specific essential materials, specialized equipment, and transportation.
2. Monopoly control of prices.
3. Price speculation and excessive accumulation of inventories.
4. Unplanned public purchasing.

The more serious field where supply of material will be unable to meet the demand is that in so-called consumer durable goods; that is, of course, automobiles, radios, washing machines, refrigerators, and so on. These shortages are most serious. First, they provide a most serious hindrance to effective defense production. Secondly, they will be the cause of shocking economic dislocations which will smash literally thousands of businesses and throw hundreds of thousands of men out of work. And third, they will prevent the production of certain types of goods for which there will be a demand.

The existence of these shortages are really a very grave public scandal. It is shocking indeed that the men whose lack of foresight

and whose adherence to business as usual are responsible for a failure to meet these shortages are still in positions of high public office and are still responsible for defense production.

An examination of the patterns of purchasing by the low-income groups shows that only a minute part of the wage earner's budget could, at best, go to the purchase of such consumer durables. Most of the wage earner's income must be devoted to the purchase of food, clothing, and shelter. For example, the budget of the Bureau of Labor Statistics, for computing the amount of wage earner's income which goes to various products, gives food as accounting for 34 percent of the budget; clothing, 10½ percent; rent, 18 percent; fuel, electricity, and ice, 6.4 percent; house furnishings, 4.2 percent. The miscellaneous item amounts to 27 percent. In this miscellaneous item only 2.2 percent goes to automobiles out of 7.8 percent for transportation; 3.7 percent goes to medical care; 3.6 percent for household operation; 5.2 percent for recreation, and so on.

Senator BARKLEY. In your figures, 2.2 percent for automobiles, did you include the purchase of gas?

Mr. HETZEL. No; that 2.2 is solely for the purchase of the car. Gas and tires are separate.

As a matter of fact, then, the major expenditures of a wage-earner's family are in the three items of food, clothing, and rent. According to this index, they take 65 percent of the income. Possibly 5 percent of such an income would go to the so-called consumer durables and scarce materials.

Senator VANDENBERG. Well, then, if any form of a manufacturer's sales tax was to exempt food, clothing, and rent, it would substantially remove the major portion of your complaint, wouldn't it?

Mr. HETZEL. It would remove part of one item, Senator. We are still opposed to such a tax even with those items taken out.

Senator VANDENBERG. I understand that, but mathematically it would reduce by half, your protest?

Mr. HETZEL. On this aspect of the argument?

Senator VANDENBERG. Yes.

Mr. HETZEL. Yes; it would be a most serious mistake to cut wage-earners' low incomes in the hopes of cutting down wage-earners' demands for the 5 percent of consumer durable goods which they may use. Most wage earners can afford only second-hand cars at that.

Certainly no one would hold that the Nation, either from lack of materials or manpower, is not able now to produce all the food, clothing, and housing our people should have.

It seems perfectly clear that until every possible penny of tax income is taken from the upper brackets of income and from corporation profits, no penny should be withdrawn from families where it will mean less to eat or wear.

Higher income taxes.—Therefore, on behalf of the C. I. O., I urge the further increase of income taxes in the high brackets. We would urge the closing of loopholes which have made the actual payment of income tax in the high brackets sometimes as little as half of the nominal rates. And I would say, parenthetically, that as far as I know there are no actual figures on the actual rates paid in the higher income brackets. The so-called rates are only a computation of the various taxes which are levied upon such incomes theoretically,

but actually what the average man with a million dollars income pays we have no figures.

Senator CONNALLY. They are available at the Treasury. They issue a pamphlet each year that shows all that information.

Mr. HETZEL. I have never seen that.

This includes, of course, the compulsory joint return. It includes the taxation of the tax-exempt securities—certainly with special emphasis upon the taxation of all newly issued securities. It further includes the taxation of undivided business profits, since these are a form of hidden income for stockholders and owners of businesses.

Senator VANDENBERG. When you speak for taxation on all issued securities, you include those issued by municipalities, States, and subdivisions?

Mr. HETZEL. Yes.

Senator CONNALLY. Now, here are the statistics, and on page 17 is a complete table; it is all here. What you probably have in mind is because of the various deductions there is no flat figure available to you, but here is the result of the actual payments and returns. If you have never seen that, you might look at it.

Mr. HETZEL. As I recall, when we attempted to compute that from that table——

Senator CONNALLY. Then you have seen this table before?

Mr. HETZEL. Yes.

Senator CONNALLY. I thought you said you didn't have such information, didn't know this was in existence?

Mr. HETZEL What I referred to was the actual effective rate; what it was upon income of the various categories as compared to the so-called nominal income rate.

Senator BARKLEY. In other words, the amount paid after deductions is equal to a rate different from that set out in the law?

Mr. HETZEL. Yes; and much lower; the T. N. E. C. figures show that.

Senator BARKLEY. Well, it is bound to be; there is bound to be a difference between the actual payment and the normal rate on the gross income.

Senator CONNALLY. It is paid on the net; that is what the tax is paid on.

Mr. HETZEL. But there is no actual showing, as far as I know, which indicates what actually was paid last year or the year before on all incomes between, say, $100,000 and $200,000.

Senator CONNALLY. That is what this table shows exactly. That is exactly what that table shows—what you say it doesn't show.

Senator JOHNSON. Did I understand you to say that you favor taxing State and municipal tax-exempt securities?

Mr. HETZEL. Yes; we think that those tax-exempt securities are one of the means by which the persons in the higher individual income brackets and certain corporations and banks accept the real effect of the tax legislation enacted by Congress.

Then there follows a section on estate and gift taxes. The new bill increases only slightly the rates on estates and gifts.

President Murray testified that it would be socially sound to place very heavy taxes upon the transfer of fortunes. The present estate and gift taxes still allow great fortunes to be passed on from genera-

tion to generation. These great fortunes put enormous social controls into the hands of persons without public or private responsibility.

There is, therefore, still a great need for effective estate and gift taxation. Such taxes would produce very substantial revenue and would greatly improve the financial structure of the Nation's industry. As President Murray pointed out, such effective taxation could be done by the adoption of an integrated estate and gift taxation program which would lay a single set of drastically increased rates upon the whole fortune, including the estate plus all the gifts plus all transfers of wealth from it. The consolidated exemption could well be lowered to $10,000. As the tax now stands, there are exemptions which allow some $140,000 to be passed on without taxation.

Excess profits and corporation taxes.—The tax program proposed by the C. I. O. urged an effective excess-profits tax. The House bill, though it increases taxes on corporations and on excess profits, does not yet meet the specifications of a really effective excess-profits tax.

The arguments, I thought, were presented quite thoroughly by the Treasury.

In spite of the fact that most corporations in their second-quarter and first-half profit reports deducted excessive allowances for the taxes proposed in the House bill, profits for the first half of 1941 have very substantially exceeded those in the first half of 1940. For example, a tabulation of the public statements of 350 leading companies made by the National City Bank of New York shows an increase of profits after tax deductions of approximately 20 percent in the first half of this year over the first half of 1940. The average rate of profits of these companies was 12.8 percent, a most generous return.

Then there follows some specific cases.

Twenty-seven machinery companies were shown to have a profit rate of 24.2 percent in 1941; 9 automobile companies, 21.1 percent; 19 automobile equipment companies, 24 percent; 14 electrical equipment companies, 14 percent.

Twenty-three leading iron and steel manufacturing companies showed an increase of 100 percent in first-half profits of 1941 over 1940.

These profits have occurred in spite of allowances for taxes under the House tax bill, allowances which the financial journals agree are generous to a fault.

Senator VANDENBERG. That is before the new wage increases?

Mr. HETZEL. No, sir; that is the first half of 1941. They seemed to absorb the wage increases without difficulty.

Senator VANDENBERG. They seemed to absorb—you better stop there.

Mr. HETZEL. Well, I didn't say "without protest."

These facts fully justify the C. I. O.'s position that more effective excess-profits taxes are essential.

The Treasury has already pointed out to the committee, citing several examples, the extent of profits with which certain companies can make off under the House tax proposal for excess profits.

It would seem to us that in the public interest it is essential to create an effective excess-profits tax. It is necessary not only to

collect the proper revenue, but also to make effective the promise that no war millionaires should be created in this war.

In order to make the excess-profits taxes really effective, there should be established either:

1. The proposal of the C. I. O. for a tax based upon a 6-percent allowance for invested capital only and a much higher rate, say to 75 percent, or, if such cannot be accomplished, at least.

2. A strengthening of the rates in the present double standard by allowing only, say, 75 percent of normal profits and applying the rates of the C. I. O. proposal.

Conclusion.—The C. I. O. believes that now is the time to strengthen the fundamental fiscal structure of the Nation. We believe that now is the time to set up a tax program calculated to meet the Nation's needs not only in terms of revenue, but also in terms of economic stability.

We therefore urge upon the committee a tax program of the character set forth in this testimony.

Just here I want to recall to the committee two sentences in the President's budget to show that we are in substantial consonance with his view. He says:

> I suggest, therefore, a financial policy aimed at collecting progressive taxes out of the higher level of national income. I am opposed to a tax policy which restricts general consumption as long as unused capacity is available and as long as our labor can be employed.

Senator VANDENBERG. I understand the President favors the lowering of exemptions. Will you part company with him there?

Mr. HETZEL. Yes.

The CHAIRMAN. I want to call your attention to your earlier statement in the first part of your paper to the effect that under our present Federal taxing system there are 54 percent consumption taxes against 46 percent ability to pay taxes. Now, the studies that have been made, based on Treasury figures and other authentic figures, show that under the present law, before we get this bill, the total ability to pay taxes amounted to $5,077,000,000, or 67.35 percent as against consumption taxes of only $2,461,000,000, round numbers, or 32.65 percent; and even after adding Social Security taxes the ability to pay taxes in point of percentage is 57.37 as against total consumption taxes, including Social Security taxes, of 42.66.

Your figures don't agree with the figures we have been working on. Now, I think it is only fair—I haven't taken up any time to do this throughout the whole bill, but the Treasury recommended originally $400,000,000 increase out of excess-profits tax. They subsequently went up to $600,000,000 out of excess-profits tax. As a matter of fact, under the House bill, the added increase out of excess profits is $1,198,300,000, which, added to the estimated production during the whole year under the existing law, makes a total excess-profits tax of $2,224,000,000 that you are getting out of that particular class of taxes; so the House bill is considerably higher in point of dollars than anything that the Treasury recommended, and also that your corporate income taxes under this House bill as we have it here today shows an increase over existing law of $2,187,700,000, whereas your consumption taxes under this bill amount to—that is, direct consumption taxes amounting to only $514,900,000. The total increased revenue as shown by this

House bill, after the elimination of the joint return, would be $3,246,700,000, so your figures don't quite jibe with the figures we have been working on.

Mr. HETZEL. Mr. Stam and I have differed somewhat on the classifications of revenue, but I think the second set of figures is close enough so that we don't fundamentally differ; I wouldn't argue about it. With regard to the figures relating to excess-profits tax, it seems to me—I don't have the report of the House committee, but as I recall it, some six or seven hundred million dollars of the increase in excess profits is simply accounted for by the removal of that amount from the normal to the excess-profits category by changing the exemptions.

The CHAIRMAN. It is moved into that category, anyway; it takes those higher rates. It is raised from 35 to 60 percent; it is all excess profits.

Mr. HETZEL. It amounts also to a reduction of some five to six hundred million dollars of normal removed to the excess profits which, frankly, I agree is a better way to handle it, anyway.

By and large, with respect to the House bill, we thought it a pretty good bill, and it is only because we would like to see it better we have made these suggestions.

Senator CONNALLY. With respect to your recommendation for repeal of these taxes: Do you favor the repeal of the taxes on whisky, wine, beer, cigarettes, and so forth?

Mr. HETZEL. Those are borderline cases.

Senator CONNALLY. Borderline. The bulk of the money is gotten from them.

Mr. HETZEL. It is the application——

Senator CONNALLY. No. What I wanted to know is: Are you or are you not for them? Do you want to repeal those taxes or not?

Mr. HETZEL. We have taken no position in the matter.

Senator CONNALLY. I want you to take one. You say you favor the repeal of all excise and sales taxes which bear upon working people's income. Now, they bear upon working people's income. Do you favor repealing them?

Mr. HETZEL. Yes; I favor repealing them.

Senator CONNALLY. I thought you did: I just wanted to ask you.

The CHAIRMAN. Any further questions?

Senator VANDENBERG. Can you break down one further figure? On page 5 where you say that food, clothing, and rent consumes 65 percent of average income. How much is just food and clothing?

Mr. HETZEL. In the paragraph above that I have broken it down. Food, 34 percent; clothing, 10½ percent.

Senator JOHNSON. Did I understand the witness to say that in making this increase of about $600,000,000 in excess-profits tax that $500,000,000 of that was taken out of the normal tax? Is that right?

The CHAIRMAN. No. We would differ about that. He was explaining how some of it came about by transfer of the credit from the normal to excess-profits tax. That is true; it does have such an effect.

I suggested just now in my colloquy with the witness that the Treasury's final suggestion was some $600,000,000 could be raised from excess profits. I find I was in error; I believe it was some $716,000,000.

The next witness, Mr. Rowland Jones, Jr.

STATEMENT OF ROWLAND JONES, Jr., WASHINGTON, D. C., REPRESENTING THE NATIONAL ASSOCIATION OF RETAIL DRUGGISTS

The CHAIRMAN. We haven't yet put any absolute limit on time. We would like to be as brief as you can. What do you propose to talk on?

Mr. JONES. Two sections of the bill: One topic, the distilled spirits tax; and the other, the retail sales tax, as contained in this bill.

The CHAIRMAN. I would like to have the committee's attention. We have witnesses scheduled through Wednesday of next week, and we have applications for some 55 more persons who desire to be heard, and that is a matter the committee ought to determine when it will close this public hearing, whether next week or run longer.

Senator CONNALLY. Why don't we limit the time rigidly and we can hear more of them; a lot of them repeat and cover the same ground.

The CHAIRMAN. That is more or less inevitable, but if we fix the final time subject to change, then we can more conveniently limit the time of the witnesses who appear.

Senator BARKLEY. Do you want to determine that time now?

The CHAIRMAN. Yes; if we might.

Senator BARKLEY. You say you have witnesses into Wednesday of next week. Personally, I feel we should close the hearing next week, but if we go into the following week, I am afraid it would take all the balance of that week.

Senator VANDENBERG. Doesn't it make some difference to the character of the people who desire to be heard? Some of them feel they have the duty of presenting their views, and it is very important to them.

Senator CONNALLY. We might classify them and let them have a spokesman for the group.

The CHAIRMAN. Some witnesses have spoken as to administrative changes in the law. The Treasury is at work on a large number of suggested administrative changes, and it is proposed to bring out a bill dealing with administrative changes in time to secure its passage and have it applied to the next tax returns. The House rigidly excluded administrative changes from the act; they are not in the act. Obviously, there are many administrative changes the Treasury would desire, and which would be recognized as desirable by the Treasury, at least it is felt they should be handled in a separate bill. If this is to be our policy, which we should now determine, we might announce it so that anyone who came down on a purely administrative change mission may know it.

Senator BARKLEY. I didn't want to leave the impression in saying that we should try to close the hearings next week that I wanted to shut off anyone, but it is getting late into the year and I think businessmen generally would like to know what taxes they are going to have to pay.

Senator GERRY. If we are really going to understand what the bill means, isn't it necessary that we give some thought to these administrative changes?

The CHAIRMAN. There might be some, but I had reference to general administrative changes not involved in this bill.

Are you to have a session tomorrow, Senator Barkley?

Senator BARKLEY. Yes; we will have a session, and it will probably require the presence of the members of the committee from 12 on. We are to take up the War Department bill and draft bill, and it is possible it may take most of the afternoon. I hope it will not, but you cannot tell.

The CHAIRMAN. We might transfer our hearing over there to the House although it is most inconvenient to try to attend a session and sit in an important hearing.

Mr. Jones, you may proceed.

Mr. JONES. My name is Rowland Jones, Jr. My address is 1163 National Press Building, Washington, D. C. I am the Washington representative of the National Association of Retail Druggists, an organization of some 27,000 independent retail druggists scattered throughout every State in the Union. In addition I represent, through affiliation with the national association, the pharmaceutical associations of the 48 States and several hundred city, county, and local groups.

In my appearance before this committee I desire to address myself only to two sections of the bill now under consideration.

Section 533, appearing on page 39 of the bill, provides an increase in the excise tax on distilled spirits from $3 to $4 per proof gallon.

Pure ethyl alcohol when used for nonbeverage purposes is subjected to this heavy tax and no exemptions are provided. We wish to point out that the tax of $4 per proof gallon provided for by this section brings the tax on pure ethyl alcohol 190 proof to $7.60 per wine gallon, the unit of measure commonly used in trade.

Senator CONNALLY. Is that what you call "absolute" alcohol?

Mr. JONES. No; absolute alcohol is theoretically 200 proof.

Senator CONNALLY. It is very hard to get; you cannot hardly buy "absolute" alcohol, can you?

Mr. JONES. Well, it is expensive and usually sold in very small bottles for scientific purposes.

The desirability of establishing a separate classification for pure ethyl alcohol in nonbeverage industrial products is recognized in every nation in the world except the United States, and a tax differential on such alcohol is now effective in every nation in the world except the United States.

Today in Canada under extreme war pressure, the tax on nonbeverage ethyl alcohol is $1.50 per proof gallon. Beverage alcohol is taxed at the rate of $7 per proof gallon. The United States during the prohibition period taxed nonbeverage alcohol at $1.10 per proof gallon, during which time beverage alcohol was taxed at the rate of $6.40 per proof gallon.

I might say that $6.40 was more of an enforcement tax than anything else.

We are advised that administration of the law in Canada is satisfactorily accomplished under a permit and bond system. A similar system was employed in the United States from 1917 until 1933, and the same can be done again today.

By requiring permits under adequate regulations for small users and requiring adequate bonds from large users of nonbeverage ethyl alcohol, with a nominal bond for the small users, diversion of such alcohol to beverage purposes can be effectively controlled. In such manner was the law enforced during the prohibition era when there existed a far greater temptation to divert to beverage purposes than exists today, because today legal, tax-paid beverage spirits can be obtained freely and easily in 45 of the States.

Through 15 district offices the Alcohol Tax Unit of the Bureau of Internal Revenue supervises and regulates the activities of more than 400,000 legal liquor taxpayers. Among these are distillers, brewers, rectifiers, wholesalers, importers, package stores, taverns, barrooms, and hotels. It seems evident, therefore, that the administrative and enforcement burden of the Alcohol Tax Unit would be but slightly increased through the addition of a new class of permittees adequately bonded and licensed under necessary regulations to use ethyl alcohol for strictly nonbeverage purposes.

Today in the majority of instances the establishment of this new class of permittee could be subjected to periodic visits by internal revenue officers as is now the common practice in the class of permittees now authorized to handle beverage-alcohol products.

It is further evident that enforcement of the liquor laws of the United States is conducted with increasing efficiency, as was indicated by the Deputy Commissioner of Internal Revenue in his testimony before the House Appropriations Committee.

Today the tax on alcohol used in essential medicinals, food products, and flavoring extracts, is exactly the same as that assessed on the same alcohol used in whisky and other alcoholic beverages. I repeat, this rate in the 1941 revenue bill is $4 per proof gallon, equal to $7.60 per wine gallon.

This excise tax was increased to $3 per proof gallon, an increase of 75 cents, in the 1940 Revenue bill, effective July 1, 1940. As a result of this increase in the excise tax, the withdrawal of tax-paid pure ethyl alcohol during the fiscal year ending June 30, 1941, declined 26½ percent, a decrease of 1,824,363 proof gallons as compared to the previous fiscal year. This decrease in withdrawals in the 12-month period represents a loss in revenue to the Treasury of $321,828. An extension of this decrease into the present fiscal year under the $4 tax proposed in this bill, leads us to expect that the revenue loss to the Treasury for this fiscal year at the $4 figure will amount to $624,467, a situation not helpful to this committee in its search for necessary revenue. The point of diminishing returns has been reached and passed for the Treasury, to the detriment of the users of nonbeverage pure ethyl alcohol.

At this point, with the permission of the committee, I offer for the record a tabulation of these figures taken from releases of July 25 and 26, 1941, of the Alcohol Tax Unit of the Bureau of Internal Revenue.

(The exhibit referred to, designated as Exhibit I, is as follows:)

EXHIBIT I.—*Figures taken from Treasury Department, Bureau of Internal Revenue, Alcohol Tax Unit*

[Releases of July 25 and 26, 1941]

Ethyl alcohol tax-paid last fiscal year as compared with the previous fiscal year and proof gallons of alcohol dumped for rectification (beverage) in like period. Difference in net nonbeverage use.

	July 1, 1940, to June 30, 1941	July 1, 1939, to June 30, 1940
	Proof gallons	*Proof gallons*
Total tax paid	27,866,524	24,344,300
Total dumped (beverage)	22,822,539	17,475,958
Net nonbeverage	5,043,985	6,868,348
At $3.00 per proof gallon	$3.00	
At $2.25 per proof gallon		$2.25
Net revenue	$15,131,955	$15,453,783

Net drop under $3 rate ..... proof gallons... 1,824,363
Net loss of revenue at $3 ..... $321,828

26½ decrease applied to 1941: 3,707,329 proof gallons at $4 = $14,829,316, or decrease under 1940 of $624,467.

Mr. JONES. It is submitted that the decrease in consumption of ethyl alcohol and the decrease in revenue is directly attributable to the increase in the tax rate, which has forced the use of substitutes wherever possible. These substitutes are not taxed and often they are inferior solvents, tending to degrade essential products and are not in the interest of public health and welfare.

It is pointed out that the administration and enforcement involved in the authorization of a new classification for nonbeverage ethyl alcohol at a lower tax rate presents no unusual or undue burden on the enforcing unit. What has been done before, can be done again by the Bureau of Internal Revenue. It has the machinery and the experience, extending over many years, in the enforcement and administrative problems involved.

The reestabishment of a separate classification for nonbeverage alcohol at a tax rate lower than that enforced upon beverage spirits is reasonable, in line with accepted practice in other countries, and gives great promise of bringing increased consumption and corresponding increase in revenue, thus reversing the present trend in this category of nonbeverage products containing alcohol.

An excise tax of $2.25 per proof gallon for nonbeverage ethyl alcohol, which we here propose, would not create an undue temptation to divert such alcohol to beverage channels.

The unlawful element now existing will probably always exist, but by and large, the vast majority of citizens and business organizations using pure ethyl alcohol for these nonbeverage purposes will comply to the letter with the law and the regulations thereunder. The experiences of the past prove this fact, in that only a small minority has ever been found in violation of the alcohol revenue laws. The lawful majority should not be penalized because of the unscrupulous minority, particularly when the penalty is not in the public interest and results in lowered total revenue receipts.

It is submitted again that a permit system with adequate regulations and, if necessary, a nominal bond for the small users of nonbeverage alcohol, together with a permit system and adequate regulations and

such bonds for the large users as are deemed necessary to protect the revenue, can be established by the Alcohol Tax Unit in an effective manner. The proponents of a separate classification of lowered tax rate for nonbeverage ethyl alcohol are certain that the establishment of such a differential will not raise any serious problems and will not be productive of a loss in revenue to the Federal Government. If the contrary is found to be true after a reasonable trial, the present system could again be easily reestablished.

With the permission of the committee, I would like to submit for the record at this point, a proposed amendment to this bill, which will provide for the differential tax which we believe to be so important.

The CHAIRMAN. You may submit it.

Mr. JONES. Amendment to H. R. 5417.

Amend title V, section 533, by inserting on page 41, after line 9, the following new subsection:

(e) *Domestic nonbeverage ethyl alcohol.*—Section 2800 of the Internal Revenue Code is amended by inserting at the end thereof the following new subsection:

(j) Domestic nonbeverage ethyl alcohol.

(1) There shall be levied and collected on all ethyl alcohol produced in the United States and used exclusively in the manufacture of food products, flavors, flavoring extracts, medicinal preparations, and other nonbeverage products, an internal-revenue tax at the rate of $2.25 on each proof gallon or wine gallon when below proof and a proportionate tax at a like rate on all fractional parts of such proof or wine gallon, to be paid by the distiller when withdrawn from bond.

(2) Manufacturers and all other persons using nonbeverage ethyl alcohol as herein provided for shall file application for permit, execute such bond, and keep such books and records as the Commissioner, with the approval of the Secretary, may by rules and regulations prescribe to insure that such nonbeverage ethyl alcohol purchased by them shall not be used for beverage purposes. Such books and records shall be preserved for a period of 4 years and during such period shall be open at all times during business hours for inspection by any internal-revenue officer or agent.

(3) Nonbeverage ethyl alcohol withdrawn and tax paid under the provisions of this subsection subsequently diverted to beverage purposes or used in the manufacture or production of any article intended for use as a beverage, shall be taxed as provided by section 2800 (a) (1) of the Internal Revenue Code, such tax to be paid by the person responsible for such diversion or prohibited use. It is hereby declared unlawful for any person procuring nonbeverage ethyl alcohol as herein provided for to divert or cause the same to be diverted to beverage purposes, and on conviction thereof such person shall be fined for each offense not more than $5,000 or be imprisoned for a period of not more than 5 years, or both.

(4) No refund shall be made on floor stocks of tax-paid ethyl alcohol held and intended for nonbeverage uses on the effective date of this act.

The Treasury Department up to this time has vigorously opposed the establishment of a differential between nonbeverage and beverage spirits. May I offer for the record here a copy of a communication signed by Mr. John L. Sullivan, Assistant Secretary of the Treasury (as Acting Secretary of the Treasury), addressed to the chairman of the Ways and Means Committee of the House of Representatives, setting forth the objections of the Treasury Department to this proposal?

EXHIBIT 3

Letter of John L. Sullivan, Assistant Secretary of the Treasury, to the Honorable Robert L. Doughton, Chairman of the Ways and Means Committee of the House of Representatives. In the exhibit the comments of The National Association of Retail Druggists appear after each paragragh.

MAY 21, 1941.

MY DEAR MR. CHAIRMAN: Further reference is made to your letter of February 28, 1941, requesting my comments and recommendations in respect of a bill (H. R. 3383, 77th Cong., 1st Sess.) introduced on February 17, 1941, by Mr. Kefauver and referred to your committee. The declared purpose of the bill is "To amend section 2800, chapter 26, of the Internal Revenue Code of 1939, to reduce the tax on nonbeverage ethyl alcohol used exclusively in the manufacture of medicinal preparations, flavoring extracts, flavors, and for other nonbeverage purposes."

An introductory paragraph requiring no comment.

"The Treasury Department is of the opinion that the bill ought not to be passed, and so recommends. The opinion and recommendations are based upon (1) the hazard to the revenue which the bill would create; (2) the direct loss of approximately $8,500,000 annually in revenue; (3) the magnitude and difficulty of administering such a bill as H. R. 3383, and the high cost of such administration—i. e., approximately $2,370,138 annually; and (4) the fact that the savings in tax to the manufacturers who would benefit by the bill would not, in our opinion, be passed on to the ultimate consumer for whose benefit, as related to us by those interested in the bill, the tax reduction is being sought."

For the reasons stated, the conclusion herein reached clearly indicates consideration of the question involved was based on a false premise. The truth of this assertion will be proved in the comment on each subsequent paragraph.

"There are few restrictions at present on the transportation and use of ethyl alcohol and other distilled spirits for nonbeverage purposes after they are tax-paid and withdrawn from bond. Such spirits, except brandy, are now subject to a tax of $3 per proof gallon. The brandy tax is $2.75 per proof gallon. The bill proposes a reduction of $1 per proof gallon on nonbeverage ethyl alcohol and a 75-cent reduction on all brandy. The privilege of withdrawal of distilled spirits for nonbeverage uses at a preferential tax rate would immediately make them susceptible of diversion to beverage purposes at handsome profits. Many years' experience in enforcing the liquor laws has shown that as soon as the use of distilled spirits is prohibited for beverage purposes or a preferential tax is imposed upon their use in certain products, it immediately becomes profitable to bootleggers and unscrupulous persons to divert them to unauthorized uses."

We take no issue with the first several sentences of this paragraph—assuming Congress is aware of existing tax rates. It was not the intent of H. R. 3383 to alter the status of brandy, and discussion of the tax on brandy may be eliminated in its entirety, thereby removing from further consideration no small part of this voluminous report.

But an example of the false premise on which the report is based is found in the "many years' experience" mentioned, obtained during the era of prohibition when beverage alcohol was taxed at $6.40 per proof gallon, and nonbeverage alcohol at $1.10 per gallon. Conditions have changed since that time, and today alcoholic beverages can be legally obtained in 45 States. The responsible men of industry advocating the establishment of a tax differential on nonbeverage alcohol used in certain essential products deeply resent the implication that with respect to spirits made available to them under a preferential tax "it immediately becomes profitable * * * to divert them to authorized use."

"No records are now maintained by the Bureau of Internal Revenue showing the quantity of ethyl alcohol or other distilled spirits used exclusively for nonbeverage purposes. The quantity used for this purpose can be estimated, however, by taking into consideration the quantity tax paid yearly and deducting from that the quantity used by rectifiers for blending with spirits bottled for beverage purposes. As an illustration, during the fiscal year ended June 30, 1939, 22,150,969 proof gallons of ethyl alcohol were tax paid, 17,522,484 gallons of this amount being used by rectifiers. The difference, 4,628,485 proof gallons, represents the quantity used for nonbeverage purposes. During the fiscal year ended June 30, 1940, 24,344,306 proof gallons were tax paid, 17,475,958 proof gallons used by rectifiers, and the difference, 6,868,348 proof gallons, used for nonbeverage purposes. These figures do not include the unknown quantity of distilled spirits other than alcohol used for nonbeverage purposes. A differential tax of $1 (the difference between $2, the rate specified in the bill, and $3, the present rate of tax on distilled spirits) on estimated withdrawals of 7,000,000 gallons of nonbeverage spirits annually would mean a loss of revenue of $7,000,000 per year."

The historical recital of statistics showing nonbeverage alcohol consumption merits no comment. But an additional example of conclusion reached on a false premise is evident in the last sentence of the paragraph.

Based on the Treasury's own figures for the first 9 months of this fiscal year, there will be consumed during 1941 but 4,407,486 gallons of nonbeverage alcohol. Compared with the fiscal year 1940, this represents a decrease in consumption of 2,460,862 gallons. The decrease is directly attributable to the tax of $3 per proof-gallon. Therefore, with establishment of a tax differential, it is reasonable to assume consumption of nonbeverage alcohol will again reach the 1940 level. Taxed at $2 per proof-gallon, Treasury revenue will be restored and increased over existing revenues. Only with a tax differential will consumption be restored. Therefore, the estimate of withdrawals and estimated loss of revenue is quite obviously based on erroneous premise.

"During the fiscal year 1940, 1,576,911 proof gallons of brandy were withdrawn, other than for use in the fortification of wine. During the first 8 months of the fiscal year ending June 30, 1941 (two-thirds of the fiscal year), 1,502,996 proof-gallons of brandy were withdrawn, other than for use in the fortification of wine. At this rate the withdrawals of brandy for the fiscal year 1941 will approximate 2,250,000 proof-gallons. On the basis of the anticipated 1941 withdrawals of brandy the reduction of the brandy tax will decrease the revenue by $1,687,500. This amount added to the $7,000,000 loss of revenue on nonbeverage spirits would bring the total of the revenue reduction under the bill to more than 8½ million dollars."

This entire paragraph deals with brandy. Inasmuch as a revision of H. R. 3383 eliminating the brandy question is offered as an amendment to the new revenue bill, this paragraph requires no further comment.

"The history of preferential distilled spirits taxes, and restricted withdrawal of spirits, is substantially as follows: A permit system was necessary for restricting the withdrawal and use of alcohol and other distilled spirits for nonbeverage purposes under the Food Control Act of August 10, 1917. The act of October 3, 1917, known as the Revenue Act of 1917, increased the tax on distilled spirits from $1.10 to $3.20 per proof-gallon when withdrawn for beverage purposes or for use in the manufacture or production of any article used or intended for use as a beverage. The rate of tax under this act on distilled spirits when withdrawn for nonbeverage purposes was $2.20 per proof-gallon. This was followed by the act of November 21, 1918, known as the War Prohibition Act. The act of February 24, 1919, known as the Revenue Act of 1918, imposed a tax of $2.20 a proof-gallon on distilled spirits when withdrawn for nonbeverage purposes and $6.40 a proof-gallon when withdrawn for beverage purposes or for use in the manufacture of any article used or intended for use as a beverage. Under the act of November 23, 1921, an additional tax of $4.20 was imposed on all nonbeverage spirits tax paid at the $2.20 per proof-gallon rate and diverted to beverage purposes or for use in the manufacture or production of any article used or intended for use as a beverage. The act of February 26, 1926, known as the Revenue Act of 1926, imposed a tax of $2.20 a proof-gallon on distilled spirits until January 1, 1927, and from January 1, 1927, to January 1, 1928, $1.65 a proof-gallon, and on and after January 1, 1928, $1.10 a proof-gallon. Provision was made for the collection of a tax of $6.40 a proof-gallon if the spirits were diverted to beverage purposes or for use in the manufacture or production of any article used or intended for use as a beverage. These rates remained in effect until the enactment of the Liquor Taxing Act of 1934, approved January 11, 1934. The withdrawal and use of distilled spirits for nonbeverage purposes under the various statutes mentioned was controlled through a rigid permit and inspection system."

The history of preferential distilled spirits taxes is informative. Proponents of a tax differential have a complete history of taxes levied on distilled spirits, dated back to the first Congress. Thus under the provisions of H. R. 3383 no new principle is sought to be established, only a restoration of the differential. The Treasury advises how administration was carried out—"A permit system was necessary for restricting the withdrawal of and use of alcohol and other distilled spirits for nonbeverage purposes under the Food Control Act of August 10, 1917. * * * The withdrawal and use of distilled spirits for nonbeverage purposes under the various statutes mentioned was controlled through a rigid permit and inspection system." If from 1917 to 1934 differentially taxed nonbeverage alcohol "was controlled through a rigid permit and inspection system" why cannot the same be done today? Then we had prohibition; today we have legal alcoholic beverages. What then provokes the opposition of the Treasury Department?

"Under these various acts many persons who had never engaged in any business requiring the use of distilled spirits discovered that they could go into the business of manufacturing flavoring extracts, food products, medicinal and

pharmaceutical preparations, withdraw large quantities of distilled spirits, use a small portion of them legitimately and divert the remainder to beverage purposes. Such manufacturers would sell their finished product at less than cost in competition with persons who had acquired Nation-wide reputations for many years in the manufacture of such products."

Observe the statements in this paragraph pertain to conditions existing in an era long past, namely, the period of prohibition. Thus conclusions drawn from experiences obtained during that period are inapplicable to present-day conditions. The incentive to divert nonbeverage alcohol to beverage purposes no longer exists, and the matter of administration of a tax differential "through a rigid permit and inspection system" should prove a comparatively small problem.

"The statistics of the Bureau of Internal Revenue show that immediately after the preferential tax was imposed and the use of distilled spirits restricted by law and regulations to nonbeverage purposes, withdrawals for such purposes substantially increased. During the fiscal year ended June 30, 1918, 5,318,046 tax gallons of distilled spirits were withdrawn for nonbeverage purposes under the acts which became effective in August and October of that fiscal year. During the next fiscal year the withdrawals were 11,990,921 tax gallons, an increase of 125 percent. During the next fiscal year, ended June 30, 1920, which included almost 6 months of operation under the National Prohibition Act, the withdrawals were 29,087,803 tax gallons or an increase of 142 percent over the previous year. In the second fiscal year of prohibition, ended June 30, 1921, the withdrawals were 35,498,976 tax gallons, an increase of 22 percent over the previous year. It was obvious that large quantities of distilled spirits were being diverted to beverage purposes in violation of the law. The regulations were made more rigid, additional personnel was employed and more effective supervision exercised over permittees. This resulted in the disapproval of applications for permits, the disapproval of applications for renewal of permits and the revocation of permits of undesirable persons. This in turn resulted in a gradual decrease in the withdrawal of distilled spirits for nonbeverage purposes from 35,498,976 tax gallons in the fiscal year ended June 30, 1921, to 6,131,748 tax gallons for the fiscal year ended June 30, 1944. No statistical data are available showing the number of permits issued prior to the fiscal year ended June 30, 1921. The records of the Department show, however, that while the gallonage of withdrawals for nonbeverage purposes was decreasing, the number of permits gradually increased from 123,155 for the fiscal year ended June 30, 1921, to 184,649 for the fiscal year ended June 30, 1933."

This paragraph recites the history of withdrawals of nonbeverage alcohol from 1918 to 1933. It may be of some interest. But the most interesting comment on nonbeverage alcohol withdrawals is pointedly omitted. This bears repeating. During the fiscal year 1940, nonbeverage alcohol consumption amounted to 6,868,348 gallons. During the fiscal year 1941, consumption will amount to 4,407,486 gallons, a decrease of 2,460,862 gallons. The decrease in consumption is due to the high tax of $3 per gallon. Consumption will increase to the 1940 level (or more) with establishment of a tax differential.

"During the period from 1921 to 1933, inclusive, there was an enormous turnover in permits each fiscal year. This involved a large amount of detailed work. The revocation of each of these permits required extensive investigation, hearings, appeals from the action of the administrative officer in the field to the Bureau of Internal Revenue and, in many instances, appeal to the courts."

Undoubtedly the events "during the period from 1921 to 1933" are accurate as related.

"Notwithstanding that there are many problems and high costs involved in the administration of a permit system as proposed by the bill, and that even under such a system there will be diversion and frauds on the revenue, such a system is the only way to control the withdrawal and use of alcohol and other distilled spirits for nonbeverage purposes at a preferential tax rate. This system, of course, would involve the investigation of applicants for permits, the disapproval of applications of unscrupulous persons, the issuance of permits to those qualifying, the examination and approval or disapproval of formulas and processes submitted by applicants, the frequent analysis of samples of finished products to insure their nonbeverage character, the inspection of permittees for compliance with law and regulations, the investigation of cases involving diversion of alcohol to beverage purposes, the citation and revocation of permits for cause, the renewal of basic permits annually, the disapproval of renewal applications for cause, the issuance of annual withdrawal permits authorizing the producer-vendor of dis-

tilled spirits to taxpay, withdraw and deliver it to the vendee-user at the preferential tax rate, and the keeping of an extensive record system."

This paragraph is supplementary to paragraphs 6 and 9 and outlined at length administrative procedure to be followed in enforcing a tax differential. Proponents of the tax differential trust the Treasury Department will enforce and administer such a differential through "a rigid permit and inspection system."

"In determining the number of permits which may follow the passage of this bill, we must assume that the 184,049 permits in force on June 30, 1933, if increased by 5 percent, would represent a fair estimate of the number of present-day users of alcohol and other distilled spirits for nonbeverage purposes. The 5 percent increase corresponds to the increase in population during this same period. Permits would have to be issued annually pursuant to renewal applications. A corresponding number of withdrawal permits would have to be issued authorizing the permittees to withdraw a portion of their yearly quota of distilled spirits at stated intervals and authorizing the producer-vendors to taxpay, withdraw, and deliver it to the permittee-users at the preferential tax rate."

Within this paragraph one finds a most outstanding example of conclusion based on false premise. The assumption is that approximately 194,000 potential permittees will make application for use of nonbeverage alcohol. This figure is obtained by taking the total of permittees during the last days of prohibition and adding thereto an additional 5 percent to compensate for the increase in population. What the Department fails to disclose is that within the grand total of permits in force during prohibition, approximately all but 22,000 were granted to individuals, who will not now seek permits, or to such individuals or firms as are now licensed and engaged in the distilled spirits business. Therefore the estimate of 194,000 potential permittees is grossly in error, and any conclusion reached respecting administration on such an estimate is likewise erroneous.

"The present personnel of the Alcohol Tax Unit is fully occupied in enforcing the internal revenue laws relating to liquors, and since very little control is exercised at present over the use of taxpaid distilled spirits for nonbeverage purposes, the proposed legislation and a permit system incident thereto would place a gigantic task upon the Bureau of Internal Revenue and would necessitate the employment of a large force of additional pharmacists, inspectors, chemists, investigators, attorneys, clerks, and stenographers."

Issue must be taken with the statement that the establishment of a tax differential "and a permit system incident thereto would place a gigantic task upon the Bureau." It is a matter of grave doubt that an additional 25,000 permittees would materially add to the administrative burdens of the Bureau, which now supervises the activities of more than 400,000 alcoholic beverage taxpayers. The additional cost of administration is next discussed below.

"A careful study has been made of the cost of the administration of this bill which restricts the use of distilled spirits withdrawn at a preferential tax rate for nonbeverage purposes. This cost is conservatively estimated at $2,370,138 annually. This includes the salaries of pharmacists, inspectors, chemists, attorneys, investigators, clerks, and stenographers required in the 15 field districts of the Alcohol Tax Unit, and in the headquarters office of the Unit at Washington. Included in this estimate is the cost of travel, purchase, and maintenance of automobiles for use by inspectors, printing, equipment, et cetera. This cost is based on the application of the preferential tax rate to both alcohol and other distilled spirits, but its application to alcohol alone would not materially reduce the cost of administration. An appropriation of $2,370,138 would have to be made simultaneously with the passage of H. R. 3383 or any similar act to cover the cost of its enforcement."

This paragraph purports to be "a careful study" of "conservatively estimated" costs of administration of a tax differential. The total cost of $2,370,138 for an "estimated" 194,000 permittees, reveals an average administrative cost of approximately $12.20 per permittee. Thus for an accurately estimated 25,000 permittees, annual administrative cost will be approximately $305,000. It must now be evident that conclusions reached on erroneous estimates of potential permittees and costs of administration incident thereto are in themselves in evident error.

"While this bill is obviously designed to reduce the tax on nonbeverage ethyl alcohol, and perhaps on brandy too, it appears that as drafted it would have the effect of imposing a $2 tax on alcohol which is now withdrawn free of tax. Alcohol is withdrawn free of tax for denaturation; for hospital and scientific use; for use of the United States, the States, and their subdivisions; and for export. It is assumed that it is not the purpose of the bill to impose a tax on ethyl alcohol withdrawn for the purposes just above enumerated."

It was never intended the provisions of H. R. 3383 should disturb the status of tax-free alcohol. Proponents of a tax differential for nonbeverage alcohol find it difficult to understand why 6,559 permittees receive tax-free alcohol and yet present no administrative problem to the Treasury Department. Is it possible that reputable businessmen and business establishments seeking a differentially taxed alcohol present insurmountable difficulties for the Department?

"Ethyl alcohol for many years has been widely used in the manufacture of flavoring extracts, food products, medicinal and pharmaceutical preparations, and by physicians, dentists, veterinarians, druggists, and hospitals. It has been urged upon the Department that the high cost of nonbeverage alcohol products to the consumer is attributable to the tax imposed by the Government. It is appropriate, therefore, to determine what a preferential tax will actually mean to the consumer in dollars and cents. There has been some doubt that a preferential tax would benefit the consumer for the reason that most of these nonbeverage products are bought in small quantities and the decrease in cost of manufacture resulting from a reduction in the tax on the alcohol used therein would not be passed on to the consumer but would result in greater profits to the manufacturer. As an illustration, the proposed tax differential of $1 per proof gallon is equivalent to $2 per wine gallon, or 1⅛ cents per fluid ounce of absolute alcohol. The amount saved on a bottle of a particular product can be computed by multiplying the number of fluid ounces of absolute alcohol contained in the bottle (found by applying the percent of alcohol to the total number of ounces contained in the bottle) by 1⅛ cents. This is illustrated by the following table:

Size of bottle (fluid ounce)	Saving in cents and fractional cents in the tax if the percent of alcohol by volume is—				
	5 percent	10 percent	25 percent	50 percent	80 percent
1	0.078 of 1 cent	0.156 of 1 cent	0.392 of 1 cent	0.781 of 1 cent [1]	1.25 cents.[1]
2	0.156 of 1 cent	0.313 of 1 cent	0.781 of 1 cent	1.563 cents	2.5 cents.[1]
4	0.313 of 1 cent [2]	0.625 of 1 cent [2]	1.563 cents [2]	3.125 cents [1]	5 cents.[1]
8	0.625 of 1 cent [2]	1.25 cents [2]	3.125 cents [2]	6.25 cents	10 cents.
16	1.25 cents [2]	2.5 cents [2]	6.25 cents [2]	12.5 cents	20 cents.

[1] Typical bottle sizes and alcohol content of flavoring extracts.
[2] Typical bottle sizes and alcoholic content of medicinal preparations.

"For example, a saving of 1¼ cents is realized on a 16-ounce bottle of a product which contains 5 percent alcohol or a 1-ounce bottle of a product which contains 80 percent alcohol, which would mean a savings of a few cents per year to the average family. In view of the small savings per bottle, it is doubtful if the consumer would benefit by the amounts indicated. Manufacturers, distributors, and retailers would probably not pass these savings on to the consumer, and they would be the beneficiaries of the differential tax rather than the consumer."

We take no issue with the recitation of uses to which nonbeverage alcohol is put, nor do we object to the clever tabulation showing possible consumer savings. But it is felt the Department demeans its dignity in presenting the "perfect" example of inconsequential savings of 1¼ cents to consumers using: A 16-ounce bottle containing 5 percent alcohol and a 1-ounce bottle containing 80 percent alcohol.

Observe that in direct proportion, as the size of the bottle decreased, the percentage of alcohol therein contained increased. The truth of the matter is that competitive conditions in industry compel price reduction wherever and whenever possible. Today the tax burden for alcohol alone in a 16-ounce bottle of lemon or orange extract is 60.3 cents. If the tax on nonbeverage alcohol is fixed at $2 per gallon, a saving of approximately 20 cents would immediately be reflected in consumer prices. In light of the foregoing, proponents of a tax differential take deep umbrage to the direct statement that "manufacturers, distributors, and retailers would probably not pass these savings on to the consumer, and they would be the beneficiaries of the differential tax rather than the consumer." But, should this violent assumption of the Treasury come to pass, consider the effect of increased income and excess-profits taxes on the manufacturers, and then determine whether or not consumer savings will be passed along.

"H. R. 3383 proposes a differential tax on ethyl alcohol only. There are, however, hundreds of manufacturers of food products and medicines throughout the country who use distilled spirits other than alcohol, such as whisky, rum, and brandy in their products. Such manufacturers, except those using brandy on

which the basic tax is to be reduced under the bill, will no doubt advocate the application of the nonbeverage tax rate to the distilled spirits used in their products. Physicians, dentists, druggists, veterinarians, and hospitals, who also use large quantities of alcohol and other distilled spirits for nonbeverage purposes, will be the beneficiaries of the nonbeverage tax rate. In considering the legislative requirements, the administrative problems, the cost of administration and loss of revenue, we have assumed that the preferential tax rate would in the end extend to the entire nonbeverage field."

H. R. 3383 intended only to establish a tax differential on ethyl alcohol consumed in the production of necessities. The bill does not provide, and the Treasury Department has gone far afield in considering administrative problems when they "assumed that the preferential tax rate would in the end extend to the entire nonbeverage field."

"The exception contained in the parenthetical portion of the amended section appearing in line 8 on page 1 and in lines 1 to 3, inclusive, on page 2, indicates that the exception to the $3 tax rate relates to 'brandy and nonbeverage alcohol used exclusively for * * * nonbeverage purposes.' The parenthetical portion appearing on page 2, after the statement of 'the rate of $3,' in lines 5, 6, 7, and 8, states a rate of $2 on brandy, without a limitation on its use, and a rate of $2 on ethyl alcohol when used for nonbeverage purposes."

It has been pointed out several times that H. R. 3383 intended no disturbance of the status of brandy. The same is true with respect to tax-free alcohol. To eliminate continued confusion in the minds of Treasury officials, an amended or revised version of H. R. 3383 is herewith submitted for inclusion in the new revenue bill. In passing, the observation is made that H. R. 3383 was written to conform with suggestions emanating from the Treasury Department.

"The provisions of the bill in subsection (a) in respect of diversions, and in subsection (b) in respect of the procurement of spirits under permit and bond, relate only to nonbeverage ethyl alcohol. It is not provided that brandy which is taxpaid at the reduced rate shall be procured under permit or that the provision relating to diversion shall be applicable thereto. The bill is taken, therefore, as proposing an outright reduction on brandy intended for beverage purposes."

This paragraph pertaining to the taxable status of brandy requires no comment in light of representations hereinbefore made.

"The tax on distilled spirits, including ethyl alcohol and brandy, was increased by 75 cents per proof gallon as a means of increasing the revenues for national defense. There has not been a lessening of the need for such revenues since the increase."

The task of procuring funds for national defense remains. Our comment on paragraph 4 is sufficiently indicative that increased revenues to the Treasury will result from establishment of the tax differential recommended in the attached amendment, namely, a tax of $2 per proof gallon on nonbeverage ethyl alcohol.

In a parallel column we have outlined an answer to the allegations of the Treasury. We sincerely believe that the position of the Treasury as evidenced by the letter of the Assistant Secretary does not present the true picture. We outline our reasons for this statement in the paragraph-by-paragraph answer here submitted.

The National Association of Retail Druggists deeply resents the implication in the Treasury Department's letter that retail druggists generally will become bootleggers and divert a lower-taxed alcohol into beverage channels if a differential nonbeverage alcohol tax is established. In this connection we have only to cite the record of retail druggists in the United States in the handling of narcotic drugs. Retail druggists are the only legitimate retail dealers in narcotic drugs under the Harrison narcotic law. Although the possible profit which might be derived from the diversion of narcotic drugs into unlawful channels is far higher than that which might be obtained by the diversion of lower-taxed alcohol into beverage uses, we learn from the Bureau of Narcotics of the Treasury Department itself, that last year, out of some 58,000 retail druggists in the United

States, only 17 were found guilty of violations of the law and the regulations in a degree serious enough to warrant their citation to their respective State boards of pharmacy for revocation of their status as registered pharmacists.

We are proud of this record and we submit that in the face of it the fears of the Treasury Department in this regard have little reasonable basis.

The tax on pure ethyl alcohol for nonbeverage use is a direct tax on products absolutely essential in the diagnosis, treatment, prevention, and cure of disease.

This excessively high tax, which as I have indicated, amounts to $7.60 per wine gallon under the proposed bill, is a direct burden on the cost of medical care, which the Federal Government has long been interested in reducing.

Other witnesses will discuss the uses and the reasons for the use of pure ethyl alcohol in nonbeverage consumer products.

Whisky and nonbeverage ethyl alcohol should not be taxed on the same basis.

The other section of this bill upon which we wish to be heard is section 2402, appearing on page 68. It is a part of a new chapter, chapter 19, of the Internal Revenue Code, providing for new retailer excise taxes, so-called.

These new provisions were inserted in the lower House by the Ways and Means Committee at the last moment, and after the public hearings on the bill had been concluded, thus foreclosing the opportunity for those affected to be heard.

Section 2402 provides an excise tax of 10 percent of the retail price of all cosmetics and toilet preparations sold in retail stores, or used in barber shops and beauty parlors. While the Ways and Means Committee denominated this new tax an "excise" tax, we desire to brand it here for what it is—a retail sales tax. Similar sales taxes on the retail sale of furs and jewelry, including watches and clocks, are provided in this chapter.

A foray was made into this field of taxation during the first World War, but it was of short duration and was soon abandoned.

We believe this retail sales tax proposal to be the opening wedge, the foot-in-the-door, the trial balloon, which if successful will be followed shortly by a general Federal retail sales tax. This is an invasion of a new tax field which has been to a considerable degree preempted by the States, 22 of which now have retail sales tax laws.

Senator VANDENBERG. Would you feel the same way about a manufacturers' sales tax?

Mr. JONES. We have something of that in this law.

Senator VANDENBERG. How do you feel about a manufacturers' sales tax as an alternative to all these other excises to which you object?

Mr. JONES. If limited to luxuries, we would have no objection to it, but a 10-percent tax, however denominated, is a very heavy tax.

Senator VANDENBERG. I am talking about a much smaller sales tax, manufacturers' sales tax, with food and clothing exempted.

Mr. JONES. I think you may have to come to it later.

Senator VANDENBERG. Well, if later, why not now?

Mr. JONES. The National Association of Retail Druggists as a basic policy has long held the position that the sales tax is unsound in

principle because it ignores the old maxim of taxation that taxes should be levied on the people in proportion to their ability to pay.

It seems to us that this proposal involved the tapping of the last great reservoir left to the Federal Government. If the Congress in its wisdom, after due deliberation, comes to the conclusion that the fiscal position of the Treasury renders a retail sales tax absolutely essential to preserve the credit of the Government and to provide for an adequate defense of the Nation, the retail druggists of the country will do their duty gladly. But we also believe that the utilization of this last important source of revenue should be postponed as long as it is possible to do so, and in so doing preserve a last ace in the hole to meet emergencies as yet unseen.

In this connection it should be pointed out that this new retail sales tax with the provision for monthly returns on the part of the retailer, represents a gigantic administrative task for the Treasury. We estimate that the three sections of this new retailers sales tax proposal covering toilet preparations and cosmetics, jewelry and furs, will bring a minimum of 800,000 monthly returns to the Treasury Department. Compared to the administrative burden involved in this, the alcohol tax differential which we ask fades into insignificance.

This retail sales tax proposal contains no exceptions, and rightly so. We expect that the syndicate store corporations, which now monopolize at least 90 percent of the field of 10-cent merchandise, will demand an exemption for this class of goods on the ground that we should not tax the 10-cent package of face powder of the shop girl. We would be glad to see such an exemption for the low-income groups, but submit that such an exemption would simply drive the majority of consumers now purchasing the larger sizes of cosmetics and toilet preparations into the syndicate "five-and-dime" stores in order to avoid the tax, thus defeating the very purpose of the tax and at the same time diverting business from regular channels of trade.

If this retail sales tax must be enacted into law to meet the revenue needs, we have an extremely pertinent suggestion to offer.

The retail sales tax has always been considered a consumer tax. We believe that the Ways and Means Committee intended it as a consumer tax. We base this opinion on the fact that the 10-percent tax imposed on the retail price of toilet preparations far exceeds the net profit on the products taxed, and on the fact that it was so designated by members of the Ways and Means Committee on the floor of the House when this tax bill was under consideration.

No retailer can absorb a tax of this size (10 percent) on the retail sale without the necessity of handling the products so taxed at a loss, a situation not helpful to this committee in its search for revenue. But we find in this bill no provision denominating this tax as one intended to be paid by the consumers of cosmetics and toilet preparations. We believe that this committee can look with profit to the enactments of the States in this retail sales tax field.

Twenty-two States now have retail sales tax laws on their statute books. These are: Alabama, Arizona, Arkansas, California, Colorado, Illinois, Indiana, Iowa, Kansas, Michigan, Mississippi, Missouri, New Mexico, North Carolina, North Dakota, Ohio, Oklahoma, South Dakota, Utah, Washington, West Virginia, and Wyoming.

Eight States have experimented with retail sales taxes and have abandoned them after trial. These are: Georgia, Idaho, Kentucky, Louisiana, Maryland, New Jersey, New York, and Pennsylvania.

Of the 22 States now having retail sales-tax laws, 14 States require by law that the sales tax be passed on to the consumer and collected at the time of sale, and prohibit the absorbing or the offering to absorb the tax by the retailer. These are Alabama, Arkansas, Colorado, Iowa, Kansas, Mississippi, Missouri, North Dakota, Ohio, Oklahoma, Utah, Washington, West Virginia, and Wyoming.

In addition, 5 States of the 22 having retail sales-tax laws permit the passing on of the tax to the consumer. These are Arizona, California, Michigan, North Carolina, and South Dakota.

The constitutionality of the pass-on provision in these laws has been established by the highest courts in Alabama, California, Kentucky, and Michigan.

I would like to submit for the record at this point in my testimony the language of the provisions in several State laws providing for the mandatory collection of the tax from the consumer at the time of sale, and making it unlawful for the retailer to absorb or to offer to absorb the tax.

The CHAIRMAN. You may place it in the record.

(The document referred to follows:)

EXHIBIT 4

The Ohio Sales Tax Act provides:

"SEC. 5546-3. Excepting as provided in section 5546-5 of the General Code, the tax imposed by section 5546-2 of the General Code shall be paid by the consumer of the vendor in every instance, and it shall be the duty of each vendor to collect from the consumer the full and exact amount of the tax payable in respect of each taxable sale, and to evidence the payment of the tax in each case by cancelling prepaid tax receipts, equal in face value to the amount thereof, in the manner and at the times provided in this section.

* * * * * * *

"SEC. 5546-15. Whoever being a vendor, as defined in this act, fails, neglects, or refuses to collect the full and exact tax as required by this act, or fails, neglects, or refuses to comply with the provisions of this act and the rules and regulations of the commission with respect to the cancellation of prepaid tax receipts, or excepting as expressly authorized pursuant to this act, refunds, remits, or rebates to a consumer, either directly or indirectly and by whatsoever means, all or any part of the tax levied by this act, or makes in any form of advertising, verbal or otherwise, any statements which might infer that he is absorbing the tax or paying the tax for the consumer by an adjustment of price, or at a price including the tax, or in any other manner whatsoever shall be deemed guilty of a misdemeanor and upon conviction thereof shall be fined not less than $25 nor more than $100, and upon conviction for a second or other subsequent offense, shall, if a corporation, be fined not less than $100 nor more than $500, or if any individual or a member of a partnership, firm, or association, be fined not less than $25 nor more than $100, or imprisoned in the county jail, or a workhouse, or other like penal or correctional institution not more than 60 days, or both."

Section XXVI of the Alabama Sales Tax Act provides:

"SEC. XXVI. It shall be unlawful for any person, firm, corporation, association, or copartnership engaged in or continuing within this State in the business for which a license or privilege tax is required by this act to fail or refuse to add to the sales price and collect from the purchaser the amount due by the taxpayer on account of said tax provided herein, or the amount due by said taxpayer on account of any taxes provided herein, or the amount due by said taxpayer on account of any taxes provided under this act, or who shall refund or offer to refund all or any part of the amount collected, or absorb or advertise directly or indirectly the absorption or refund of said tax or any portion of the same."

The State Sales Tax Act of the State of North Dakota provides:

"SEC. 6. Retailers shall add the tax imposed under this act, or the average equivalent thereof, to the sales price or charge and when added such taxes shall constitute a part of such price or charge, shall be a debt from consumer or user to retailer until paid, and shall be recoverable at law in the same manner as other debts.

"Agreements between competing retailers, or the adoption of appropriate rules and regulations by organizations or associations of retailers to provide uniform methods for adding such tax or the average equivalent thereof, and which do not involve price-fixing agreements otherwise unlawful, and which shall first have the approval of the commissioner, are expressly authorized and shall be held not to be in violation of any antitrust laws of this State.

"SEC. 7. *Unlawful acts.*—It shall be unlawful for any retailer to advertise or hold out or state to the public or to any consumer, directly or indirectly, that the tax or any part thereof imposed by this act will be assumed or absorbed by the retailer or that it will not be considered as an element in the price to the consumer, or, if added, that it or any part thereof will be refunded."

Section 57.3305 of the South Dakota Code, a part of the sales-tax law, provides:

"57.3305. Advertising or offering by retailer to absorb or include tax in price or refund thereof unlawful. It shall be unlawful for any retailer to advertise or hold out or state to the public or to any consumer, directly or indirectly, that the tax or any part thereof imposed by this chapter will be assumed or absorbed by the retailer or that it will not be considered as an element in the price to the consumer, or, if added, that it or any part thereof will be refunded."

The West Virginia sales-tax law provides:

"SEC. 10. *Tax paid by consumer.*—It is the intent of this article that the tax levied hereunder shall be passed on to and be paid by the consumer. The amount of the tax shall be added to the sales price and shall constitute a part of that price and be collectible as such.

"SEC. 11. *Seller may not pay tax; penalty.*—A person engaged in any business taxable hereunder shall not advertise or hold out to the public in any manner, directly or indirectly, that he will absorb all or any part of the tax, or that the tax imposed by this article is not to be considered an element in the price to the consumer. A person who violates this provision shall be guilty of a misdemeanor and upon conviction shall be punishable by a fine of not less than $50, nor more than $1,000, or imprisonment in the county jail for not exceeding 1 year, or both, in the discretion of the court."

Article 1 of the Rules and Regulations promulgated by the Commissioner of Revenues of the State of Arkansas reads as follows:

"The seller must collect the tax from the purchaser or consumer and must remit the tax to the commissioner of revenues in the manner hereinafter provided in these regulations. Failure for any reason to collect the tax from the purchaser or consumer will forfeit the seller's permit and will make the seller liable for the tax."

Section 28a of article II of the Excise Revenue Act of the State of Arizona, reads as follows:

"28a. *Unfair competition.*—No person engaged in any of the businesses classified in section 2, shall advertise or hold out to the public in any manner, directly or indirectly, that the tax herein imposed is not considered as an element in the price to the consumer. Any person violating the provisions of this section shall be guilty of a misdemeanor."

The Colorado retail sales tax law provides:

"SEC. 6. Retailers shall, as far as practicable, add the tax imposed under articles 1 to 5 of this chapter, or the average equivalent thereof, to the sales tax or charge, showing such tax as a separate and distinct item and when added, such tax shall constitute a part of the price or charge, shall be a debt from consumer or user to retailer until paid, and shall be recoverable at law in the same manner as other debts.

* * * * * * *

"SEC. 8. It shall be unlawful for any retailer to advertise or hold out or state to the public or to any consumer, directly or indirectly, that the tax or any part thereof imposed by articles 1 to 5 of this chapter will be assumed or absorbed by the retailer or that it will not be added to the selling price of the property sold, or if added that it or any part thereof will be refunded."

The Iowa retail sales tax law provides:

"SEC. 6943.079. *Adding of tax.*—Retailers shall, as far as practicable, add the tax imposed under this division, or the average equivalent thereof, to the sales price or charge and when added such tax shall constitute a part of such price or charge, shall be a debt from consumer or user to retailer until paid, and shall be recoverable at law in the same manner as other debts.

"Agreements between competing retailers, or the adoption of appropriate rules and regulations by organizations or associations of retailers to provide uniform methods for adding such tax or the average equivalent thereof, and which do not involve price-fixing agreements otherwise unlawful, are expressly authorized and shall be held not in violation of chapter 434, or other anti-trust laws of this State. It shall be the duty of the commission to cooperate with such retailers, organizations, or associations in formulating such agreements, rules, and regulations. The commission shall have the power to adopt and promulgate rules and regulations for adding such tax, or the average equivalent thereof, by providing different methods of applying uniformly to retailers within the same general classification for the purpose of enabling such retailers to add and collect, as far as practicable, the amount of such tax.

"SEC. 6943.080. *Unlawful acts.*—It shall be unlawful for any retailer to advertise or hold out or state to the public of to any consumer, directly or indirectly, that the tax or any part thereof imposed by this division will be assumed or absorbed by the retailer or that it will not be considered as an element in the price to the consumer, or if added, that it or any part thereof will be refunded."

The regulations under the Kansas Retailers' Sales Tax Act provide as follows:

"Article 11. *Tax to be passed on.*—The retailer is required to pass on to the consumer or user the full amount of the tax imposed by this act, or an amount equal as nearly as possible or practicable to the average equivalent thereof.

"Article 12. *Unlawful advertising.*—The law provides that it shall be a misdemeanor, subject to fine or imprisonment or both, 'to advertise or hold out, or state to the public, or to any consumer, directly or indirectly, that the tax, or any part thereof, imposed by this act will be assumed or absorbed by the retailer, or that it will not be considered as an element in the price of the consumer, or if added, that it, or any part thereof, will be refunded.'"

Chapter 155, Laws of 1936 of the State of Mississippi, provides as follows:

"SEC. 3. It shall be unlawful for any person, firm, or corporation who is engaging or continuing within this State in the business of selling any tangible property and who is liable for a privilege tax assessed and levied by section 2c of chapter 119, Laws of Mississippi, 1934, to fail or refuse to add to the sale price and collect the amount due by him on account of said tax provided in section 1 hereof or to add or collect more than the amount fixed by section 1 of this act on account of said tax.

"SEC. 4. Any person, firm, or corporation violating sections 1 or 3 of the provisions of this act shall be guilty of a misdemeanor, and upon conviction shall be fined in a sum not less than $50 nor more than $100, and may be committed to jail until such fine and costs are paid."

The Missouri Sales Tax Act provides:

"SEC. 11411. * * * The seller of any property or person rendering any service, subject to the tax imposed by this article, is directed to collect the tax from the purchaser of such property or the recipient of the service as the case may be. The tax imposed by this article is a tax upon the sale, service, or transaction and shall be collected by the person making the sale or rendering the service at the time of making or rendering such sale, service, or transaction. It shall be unlawful for any person to advertise or hold out or state to the public or to any customer directly or indirectly, that the tax or any part thereof imposed by this article, and required to be collected by him will be assumed or absorbed by the person, or that it will not be added to the selling price of the property sold or service rendered, or if added, that it or any part thereof will be refunded. Any person violating any of the provisions of this section shall be guilty of a misdemeanor.

"SEC. 11412. It shall be the duty of every person making any purchase or receiving any service upon which a tax is imposed by this article to pay the amount of such tax to the person making such sale or rendering such service; any person who shall willfully and intentionally refuse to pay such tax shall be guilty of a misdemeanor."

The New Mexico school tax laws provide:

"SEC. 203. (B) *Absorbing tax—advertisement.*—It shall be unlawful for any person engaged in any business or profession to directly advertise that any tax imposed by this act is not considered as an element of the price of property sold or service rendered."

The sales tax regulations issued by the State Tax Commission of Utah provide:

"4. *Mandatory collection of tax.*—Chapter 111, Laws of Utah, 1937, amends section 5 of the Emergency Revenue Act of 1933 to read in part as follows: '* * * The vendor shall collect from the vendee * * *'.

"Under the act, as amended, the vendor is required to collect the tax from the vendee with respect to all transactions subject to tax. In all cases the full amount of the tax must be added to the sales price and collected or charged as a separate item. The seller is responsible for all tax funds in his possession.

"It will be considered a violation of the act for the vendor to absorb the tax or to consider that the tax is included and collected as a part of the sales price. The total purchase charge on sales consummated must not be quoted in fractions of 1 cent for the purpose of eliminating the use of tokens."

The Wyoming Selective Sales Tax Act provides:

"Article 4, item 3. *Absorption of tax by vendor.*—It is unlawful for any retailer or vendor to advertise or hold out, or state to the public or to any user or consumer, directly or indirectly, that he will absorb the tax on sales of 25 cents or more, or consider the tax as part of the purchase price, or that he will refund the tax to the purchaser. A person who violates this rule is guilty of a misdemeanor."

Many of these mandatory passing-on provisions were added to State laws after experience had shown that the absence of such provisions was highly productive of unfair trade practices on the part of a few retailers who sought to utilize the tax as a vehicle to divert trade from its ordinary channels. Some retailers advertised that their prices did not include the sales tax, thus placing an enormous competitive burden upon the mass of retailers, mostly small in size, whom the State had designated as tax collectors. This will be the practice in this case if not expressly prohibited.

If this retail-sales-tax provisions is to be approved by this committee and by the Senate, we respectfully request that a mandatory pass-on provision similar to that found to be necessary in State retail-sales-tax laws, be provided for by appropriate language in this bill.

The retail druggists of the country have carried and will continue to carry the increasing burdens of taxation in the same degree as all other citizens. They cannot maintain their place in the national economy as employers, as taxpayers, and as distributors of necessary products, if they are forced to absorb this very heavy tax on the retail value of products which represent a substantial portion of their business. To expect them to do so is to ignore the plain economics of their business and the basic theory of the retail-sales tax.

We have one further suggestion: The bill provides that these retail sales taxes shall be remitted to the Treasury in monthly returns. We submit that the requirement of monthly returns by retailers is unnecessarily burdensome to retailers generally, and that a quarterly return would be far less costly to the retailers affected, as well as to the Treasury.

We believe that these two proposals are sound, in the public interest, and that they conform to every test of an enlightened tax policy. They will not subtract a single dollar from the estimated revenue provided for in this bill. Indeed, in the case of the nonbeverage alcohol tax differential proposal, the revenue will increase beyond

the conservatively estimated cost of administration. As for the mandatory pass-on provision in the retail sales tax chapter, the adoption of our proposal will bring with it a more efficient collection of the tax involved. Failure to adopt such a provision, if we must have a retail sales tax, will place a dangerous premium on evasion.

The CHAIRMAN. Thank you, Mr. Jones.

Mr. JONES. Thank you.

STATEMENT OF DR. E. F. KELLY, WASHINGTON, D. C., REPRESENTING AMERICAN PHARMACEUTICAL ASSOCIATION

The CHAIRMAN. Dr. Kelly, will you give your full name to the reporter, please?

Dr. KELLY. My name is E. F. Kelly.

The CHAIRMAN. What interest do you represent?

Dr. KELLY. I represent the American Pharmaceutical Association, 2215 Constitution Avenue, Washington.

I wish to supplement very briefly the statement which Mr. Jones has just made with respect to the use of alcohol and the tax on alcohol in the preparation of drugs and medicines. I have a statement here, but to save time I will just briefly refer to the outstanding points and then file the statement.

The CHAIRMAN. You may do that.

Dr. KELLY. With the sole exception of water, ethyl alcohol is the solvent most generally employed in the preparation of drugs and medicines and in filling prescriptions. It is also used as a preservative in many medicinal preparations in which it is not required as a solvent in order to prevent fermentation and other undesirable changes.

Other solvents and preservatives are available which in some instances are as effective as alcohol, but none of them can be used as a substitute for alcohol because they have undesirable, or in some instances, dangerous physiological effects when taken internally or applied externally in medicine. Alcohol is, therefore, a necessary and indispensable material in the preparation and preservation of many drugs and medicines which are essential to the health and welfare of our people.

The following table will give the percentage of alcohol contained in several well-known and widely used medicines:

	Percent		*Percent*
Fluid extract of belladonna root	70	Tincture of capsicum	85
Fluid extract of cinchona	60	Tincture of digitalis	70
Fluid extract of ergot	40	Tincture of nux vomica	70
Fluid extract of rhubarb	60	Paregoric	46
Tincture of asafetida	80	Tincture of arnica	68

In these preparations the alcohol content ranges from 40 to 85 percent. Those containing 50 percent of alcohol will carry a basic charge of $4 per wine gallon for the alcohol alone under the terms of the bill under consideration, and tincture of digitalis used in the treatment of heart disease will carry a charge of almost $6 per gallon. In many instances where the product is distributed through the usual channels, this basic tax is further increased by added expenses.

It does not seem reasonable to place this increasing tax burden on the treatment and prevention of disease.

Alcohol itself has certain undesirable physiological effects and since it is taxed because of its employment in many forms as a beverage, extensive and expensive research has been carried on for many years with the object of developing a satisfactory substitute for alcohol as a solvent and preservative in connection with drugs and medicines. It is a great disappointment to all concerned that these efforts have been without result up to this time and that they do not even indicate that such a substitute can be developed in the future.

The United States Pharmacopoeia and the National Formulary, which are recognized under the Federal Food, Drug, and Cosmetic Act and corresponding State legislation as providing standards for the drugs recognized in these books, both direct the use of alcohol as a solvent or preservative or both, in a majority of the preparations for which directions are given. The use of alcohol is therefore legally binding on those who make and distribute these products if they are labeled as official preparations. It is also required under this legislation, that the percentage of alcohol contained in medicinal preparations shall be stated on their labels.

The volume of such medicinal preparations runs into hundreds of thousands of gallons per year. An extensive survey of the ingredients of prescriptions made in 1931–32 showed that alcohol either as such or as an ingredient of other preparations, was contained in about 60 percent of the approximately 250,000,000 prescriptions filled annually in the United States.

The facts given in this brief statement illustrate that alcohol is a aluable and indispensable solvent and preservative in the preparation of many necessary drugs and medicines and that any tax on such alcohol except possibly such tax as may be required to cover the cost of administration and to prevent diversion, is a direct tax on articles required in the diagnosis, treatment, prevention and cure of diseases, or in other words, is a tax on health.

It is, therefore, urgently requested that favorable action be taken on the recommendation that differential be made in the tax on medicinal as compared with beverage alcohol, and that the rate be set at $2.25 per proof gallon as provided for in an amendment to be substituted during this hearing. The tax on beverage alcohol in Canada is now $7 per proof gallon and there a differential tax of $1.50 is provided for alcohol used in drugs and medicines.

A differential in the tax on medicinal alcohol as compared with the tax on alcohol for beverage purposes, is imperative at this critical time in order to prevent an increase in the cost to the public of official drugs and medicines which are not luxuries but necessities.

I also wish to add, Mr. Chairman, that we desire to be recorded as supporting the position taken by Mr. Jones with respect to the 10-percent tax. We ask that a definite and clear mandatory provision requiring that it be passed on to the consumer be included in the act.

The CHAIRMAN. Mr. Fred Griffiths.

Mr. JONES. Mr. Griffiths cannot be here today and he asked permission to file a brief.

The CHAIRMAN. Very well; I shall be glad to have him do so.

Mr. Friedman.

STATEMENT OF ELISHA M. FRIEDMAN, NEW YORK, N. Y.

The CHAIRMAN. Will you give your name?

Mr. FRIEDMAN. My name is Elisha M. Friedman, consulting economist, of New York City. I represent no group or interest. I am going to discuss the capital-gains tax from one angle: What is the possibility of increasing the yield? The subject is of general public importance. I am not going to try to persuade you or argue a point. I shall merely present some pertinent facts. I spent about 2 months analyzing Treasury statistics, and I have asked Mr. Felton Johnston to leave on each of your desks two documents which contain those facts: Statistics of Income for 1938, and Million Dollar Incomes. I have also here a copy of the Dow-Jones stock chart. You have been listening to witnesses who have asked that taxes be lowered on various items affecting their interests. All witnesses have pleaded "Do not tax us. Tax the other fellow." The tendency would be to reduce Government receipts. The presentation I should like to make is to find a method of increasing the Treasury receipts.

Now, my thesis in brief is that it would be possible to get an increase of income of 100 millions to 400 millions of dollars out of the modification of the capital-gains tax along the following major line. First, segregate capital gains and losses from regular income. This would have the effect of eliminating the deductions of capital losses against regular income, which amount to very substantial items, running as high as $584,000,000 in the year 1938. Second, eliminate the holding period. If you virtually compel a man, by high taxes, to hold securities or property for 2 years, you prevent the Treasury from taxing gains which it might have collected on a shorter period. Third, restrict offset of losses to segregated gains. Fourth, in fairness to the taxpayer permit him to carry the loss over a year or two. Fifth, fix a low rate of 10, 12, or 15 percent. Sixth, tax the professional trader at the full income-tax rates.

Now, I shall file this brief, but I can dash through it pretty quickly.

Senator TAFT. You propose to take the capital gains out of the normal tax and put it in a separate category?

Mr. FRIEDMAN. Precisely, and you will find in the two documents which you have on your desk, and other official sources, carefully prepared data and statistics which support my contention.

By the way, Mr. Sullivan, Assistant Secretary of the Treasury is here, and Mr. Johnston might give him a copy of the two documents and the stock price chart distributed to the Senators.

THE DOW-JONES STOCK AVERAGES, 1897–1940. MONTHLY HIGH AND LOW OF CLOSING AVERAGES

The following chart of stock prices shows that the trend for railroads is down since the early nineteen hundreds, except for the brief period in the late twenties. Utility share prices likewise show a declining trend. There are no long-term capital gains either in railroads or utilities. Industrial shares did show a rising trend up to 1925 but since 1930 the trend is sharply down. All industrial shares bought from 1926 to 1930 now show paper losses which will be realized and deducted from the income tax of future years. However, there are abundant short term capital gains which, if taxed at low rates, would yield handsome revenues to the Treasury.

MONTHLY HIGH AND LOW OF
CLOSING AVERAGES
INDUSTRIALS
12 INDUSTRIALS
JAN. 1897—MAR. 1915
UTILITIES
RAILROADS

The capital-gains tax has been part of our fiscal structure for about 20 years. At times it provided abundant revenue. At times it provided no revenue and even caused a reduction of receipts from the income tax. Always, it has been a fund-freezing device, without privilege of acting under a license. This freezing has been a detriment to our economy. It penalizes risk-taking. It checks switching into new securities issued for expansion and into defense bonds. Analysis and the experience with the various capital-gains acts leads inevitably to concrete proposals for legislation. Such legislation should, and will, both provide much more revenue, and at the same time, liquefy the now frozen portfolios of investors.

I. FACTS

A. *Retreat of capitalism.*—For a generation or so, capitalism has been on the retreat.

1. *In railroads.*—Social, economic, and political forces have compelled the retreat of private capital in the railroad industry since the early 1900's. To talk of long-term capital gains in railroad securities is utterly unreal. Such gains as are now possible in the railroad fields are now short-term, either cyclical or technical.

2. *In utilities.*—Likewise, utility equities have been declining so that 1941 prices for many shares are less than the bottom of the bear market in 1932. For the electric and gas stocks as a whole, the price trend has been down since the passage of the Utility Act of 1935. The utility investor is fighting a rear-guard retreat. Capital gains in utility shares just do not exist except in the minds of theorists who ignore facts.

3. *In industry.*—Industrial shares are in a long-term bear market. If on any chart showing any stock price index, you connect the top of the booms of 1929 and of 1937, the line forms a declining roof for prices. This is the evidence of a long-term bear market. Never has this down trend been broken. Perhaps it indicates that the private investor is slowly being expropriated. There were long-term gains in industrial securities until the 1920's. Since 1929, social, economic, and political forces have destroyed the long-term gains in the industrial shares index and left only the intermediate fluctuations. Therefore, merely by doing nothing, the long-term "sitter" of the 1900's has become the great speculator of the last decade.

TABLE I.—*Market value at the month end of all stocks listed on the New York Stock Exchange*

[In billions of dollars]

Year	High	Low	Difference	Year	High	Low	Difference
1925	$33.7	$26.9	$6.8	1933	36.7	19.7	17.0
1926	37.3	32.3	5.0	1934	37.4	30.8	6.6
1927	48.5	38.4	10.1	1935	45.0	30.9	14.1
1928	66.1	48.5	17.6	1936	60.0	46.9	13.1
1929	89.7	63.6	26.1	1937	62.6	40.7	21.9
1930	76.1	53.3	22.8	1938	47.0	31.9	15.1
1931	57.1	31.1	26.0	1939	47.5	40.7	6.8
1932	27.8	15.6	12.2	1940	46.8	36.5	10.3

B. *What are the odds in the market?*—There is a popular tradition that people always lose money in the stock market. To support the general public impression, the United States Government can provide exact evidence. In a report, entitled "Million Dollar Incomes," covering the 20-year period, 1917–36, the facts are revealed. Presumably, people with incomes of $1,000,000 or over, have access to adequate statistical data, economic advice and inside information. The group (No. 2), whose capital gains were more than regular income, suffered from 1917–36 a decline in annual income from $7,300,000 to $4,600,000 and a correspondingly substantial decline in principal. The group (No. 3) that took capital gains showed $97,000,000 lost to $63,000,000 gained—odds of 3 to 2 against the market. This group of millionaires, undoubtedly well connected, probably had a better performance than the average small trader. Yet, the chances of loss are so high as to cut the ground under the whole theory of the capital-gains tax. The Congress should call upon the Treasury for information similar to the above for a few selected years for a large group of returns classified by groups.

C. *Big market fluctuations and small capital gains.*—The present capital-gains tax is undoubtedly ineffective as a revenue producer. One needs but to compare the total fluctuations on the New York Stock Exchange alone with the estimated taxes on capital gains and losses. Such a comparison shows that although the market does swing, the Treasury collects little capital-gains tax on these swings.

TABLE II.—*Relation of net capital gain and tax revenue therefrom to fluctuation in market value of all stocks listed on the New York Stock Exchange*

Year	Difference in value, top to bottom (in billions of dollars) (A)	Total net capital gain (in millions of dollars) (B)	Tax revenue received (in millions of dollars) (C)	Year	Difference in value, top to bottom (in billions of dollars) (A)	Total net capital gain (in millions of dollars) (B)	Tax revenue received (in millions of dollars) (C)
1926	5.0	2,378	225	1934	6.6	313	17
1927	10.1	2,895	297	1935	14.1	730	85

[1] Not available.

In 1926–27 the capital gains rates were 12½ percent for holdings of 2 years or more. In 1934–35 rates ranged up to 47.40 percent on capital gains of 2 to 5 years. Assuming the same ratio of Treasury revenue to total fluctuation as in the average of 1926–27, viz, 1.59 percent, the Treasury net revenue in 1934 and 1935 would have been not $102,000,000 but $550,000,000, an additional tax of about $225,000,000 per annum. The law in 1926–27 had a 2-year holding requirement. Without it, the Treasury could have had even more revenue.

TABLE III.—*Relation of net capital gains and taxes thereon to net differences in market value and to gross market fluctuation in value*

Year	Total net capital gain (million) (A)	Revenue from capital gain tax (million) (B)	Difference in value of all stocks on New York Stock Exchange—top to bottom (billion) (C)	Ratio of capital gain to difference in value B/C (D)	Estimated travel ratio (E)	Estimated total fluctuation (billion) (F)	Ratio tax revenue to fluctuations B/F (G)
				Percent			*Percent*
1926	2,378	225	5.0	4.50	3.08	15.4	1.46
1927	2.894	297	10.1	2.00	1.72	17.4	1.70
Average	2.636	261	7.5	3.47	2.19	16.4	1.59
1934	313	17	6.6	.26	3.66	24.2	.07
1935	731	85	14.1	.60	1.78	25.0	.34
Average	522	51	10.3	.49	2.40	24.8	.21

In rising markets 1927 and 1935 the fluctuations were few and the the net advance large. In prebull market years 1926 and 1934 the market fluctuations were many and the net advance little. A striking example of a small net advance in the Dow-Jones index of industrial share prices is the experience of the last 3 years. On April 1, 1938, it stood at 98.75. On May 1, 1941, it stood at 115. The net advance was 16.33 points, but in the interval of approximately 3 years this index fluctuated without any trend over a range of 340 points on the Dow-Jones average. If there were no time limit or holding period, the Treasury could have received abundant tax revenue on intervening capital gains in the 340 point fluctuations or travel but could receive very little on the 16-point net advance.

D. *History of legislation on capital-gains taxation.*—Congress has tried in the 11 revisions of the past 28 years, since the Revenue Act of 1913, to arrive at "a practical, intelligent, and just law" on capital-gains taxation. The receipts from this tax indicate that "such a basis has not yet been found." (Source: Vinson Report, Exhibit I, Historical Summary, pp. 83, 84, 85.) The broad principles of past revisions are clear. First, gains were included with other income and losses were not deductible (1913 law). Then losses were made deductible to the extent of gains (1916 law). Thereafter, losses were allowed in full against any income (1918 law). Subsequently, came the principle of segregation of short-term from long-term capital gains or losses (1921 law). The long-term gains were subject to a flat tax of 12½ percent. It wais during this period that the Treasury received huge income. In 1934, the law introduced the complicated holding period with about 40 rate classes graded by months up to 10 years. This period shows woefully small receipts from the tax. In 1938, the law set rates of 20 percent on capital gains exceeding 18 months and 15 percent on capital gains exceeding 2 years. Short-term gains under 18 months were taxed at graduated income-tax rates. The tax receipts have not been published for reasons unknown.

E. *Capital gains nonexistent.*—Over a generation, losses and gains so completely offset each other that net capital gains were insignificant (Senate hearings 1938, p. 245). For the period 1917–31, the net capital gain was less than 3 percent of the taxable income for the period. If the years of wild stock market rise, 1926–29, are excluded, as being unlikely ever to recur, then the net result is not a capital gain but a capital loss of about 0.03 percent of the average taxable income. The Treasury has not published a continuation of this table showing net gains, net losses, and differences by years since 1931. However, an analysis of the six reports, "Statistics of Income" published by the Treasury yearly shows that, for the years 1934–39, inclusive, the percentage of net capital gain after deducting net capital losses is only 0.92 of 1 percent of total taxable income for all taxpayers.

Nor has the Treasury, to my knowledge, published a complete history showing the net receipts from the capital gains tax as well as the loss in tax revenue through deductions for capital losses for the period 1917–41. The Congress should insist on having the facts before it in order to reach intelligent conclusions. Probably, if the years, 1931–40 were included, then the entire period, 1917–40, would show either insignificant net capital gains or a net capital loss. Certainly, it is very easy to take periods of 5 or 10 years within the period 1917–41, which show on balance a net loss to the taxpayer and also a net deficit of revenue to the Treasury, as the period 1918–23, inclusive, or the period, 1930–35 inclusive (Senate hearing on H. R. 9682, pp. 245 and 472). Capital losses in 1930–32 caused a reduction of $184,000,000 from the income-tax receipts which more than offset the $118,000,000 receipts from capital gains taxes in 1933–35 (Vinson report, p. 90).

A study of the facts concerning 1938 capital gains is revealing. Net long-term losses were $584,000,000. Net long-term gains were $266. The net loss was $318,000,000. The total net loss came from taxpayers with incomes under $50,000. Taxpayers with incomes over $50,000 had an excess of net capital gains. The present tax law apparently hits the little fellow rather than the big fellow (Statistics of Income for 1938, Treasury Department).

F. *Volume of tax revenue depends on rates inversely.*—An official report (Vinson report, p. 88) shows for the year 1926–36 that small taxpayers took short-term gains under the income-tax class because their income-tax rate was low. However, short-term gains realized by taxpayers and taxes thereon paid into the Treasury declined sharply as the income-tax rates rose. On the other hand, the tax rate was low on long-term capital gains. In 1934, over 70 percent of total capital gains were taken by groups with incomes above $100,000 in securities held more than 10 years and enjoing the lowest rate. The high income group realized heavily on such capital gains and provided large tax receipts for the Treasury. Obviously, low rates stimulated realization and tax payments to the Treasury.

Again in 1938, long-term net capital gains were taxed at a low flat rate. Incomes under $5,000 reported $30,000,000 in long-term net capital gains. Incomes over $1,000,000 reported $60,000,000, or 200 percent as much. However, short-term net capital gains were subject to the graduated income tax. Incomes under $5,000 reported

$45,000,000 short-term capital gains. Incomes over $1,000,000 reported, not 200 percent as much or $90,000,000, but only $175,000, or four-tenths of 1 percent as much. Had all taxpayers reported short-term gains as freely as the low-rate group. the Treasury would have had $250,000,000 more in sources subject to tax. The present capital gains tax is not a revenue-producing measure but a revenue-preventing measure.

Statistics of Income, 1938 (table IV, p. 10), shows that as a percentage of total income, short-term capital gains subject to graduated income-tax rates declined from 1.35 percent for the $25,000 income group to 0.16 percent for the incomes of one million or over. However, as a percentage of total income, the long-term capital gains subject to a low flat rose from 0.21 percent for the income under $5,000 to 56.40 percent for the incomes over a million dollars.

On the other hand, in 1937 securities were much higher and book profits or unrealized appreciation was large. But the rates were high, up to 47-plus percent being under the 1934 law. Therefore gains realized were small for groups subject to high income-tax rates. In 1938 a low flat rate of 20 percent and 15 percent was reintroduced on long-term capital gains and stimulated the taking of profit.

TABLE IV.—*Percentage of net capital gain to total income*

Income group	1937	1938	Income group	1937	1938
	Percent	*Percent*		*Percent*	*Percent*
Under $5,000	0.78	0.55	$150,000-$200,000	4.35	11.95
$5,000-$10,000	2.27	1.66	$300,000-$500,000	7.60	18.77

G. *Congressional report on millionaire incomes.*—A report of the Joint Congressional Committee on Taxation, entitled "Million Dollar Incomes," has tremendous significance for capital-gains tax legislation.

1. *Capital gains of big traders.*—This report shows what an illusion underlies the theory that capital gains represent capacity to pay. Group 2 consisted of market operators who derived more than 50 percent of their net income in the years 1926-29 from net capital gains. This group suffered a shrinkage of income from $7,300,000 to $4,600,000 from 1917 to 1936, and their capital shrank from $146,000,000 to $117,000,000 (p. 13).

Group 3, or inept speculators, of the million dollar incomes consists of individuals for whom also there is a complete record from 1917-36 of their capital gains and losses. For this group the net gains total $63,300,000 and the net losses $97,800,000. The experience of this group is probably characteristic of the great rank and file of stockholders whom the Treasury is taxing on illusory taxable gains (Million Dollar Incomes, p. 16). Apparently the "big boys" with inside information strikingly disprove the assumption that capital gains represent regular and consistent capacity to pay. Neither in the scientific laboratory nor in the field would such striking observations be ignored. Yet the

present capital-gains tax legislation is based on an assumption which not only has never been verified but strikingly contradicted in a Government document.

2. *Capital-gains rates versus capital gains realized.*—A study of the million dollar incomes clearly shows that when the rates of tax on capital gains are high, the percentage of net capital gains realized to total income is small. When the rates are low, the percentage of such net gains to total income is high. (See pp. 20, 30, 40.)

3. *Capital gains rates versus deduction for capital loss.*—This study of million-dollar incomes also furnishes interesting laboratory results concerning the effect of tax rates on realization of losses. For the total number of million-dollar incomes as well as for the three groups, investors, active traders, and inept traders, the same conclusion holds. Under low rates of tax on capital gains, deductions for net losses are low as a percentage of total income and under high rates the deductions are high (Million Dollar Incomes, p. 43). High tax rates evidently stimulate the taxpayer to charge off all losses possible (ibid., p. 6).

Senator DANAHER. May I ask a question. Now, the rate was the same in the low-tax period from 1925 to 1929 as it was in the low-tax period from 1930 to 1931, inclusive?

Mr. FRIEDMAN. Yes; tax deductions for capital losses varied.

Senator DANAHER. But the percentage in the former was 1.81.

Mr. FRIEDMAN. Yes; but we were in the midst of the most violent deflation in history in 1930 and 1931, but compare the losses deducted in that period of great deflation with the years 1932 to 1936, which was a period of recovery, but when the rate was high, and you will find that in the most violent deflation in history they deducted 49 percent, but in the sensational rise, 1932 to 1936, they deducted 56 percent.

Senator DANAHER. Well, you attribute the disparity to the period.

Mr. FRIEDMAN. I am not trying to get away from the evident fact; I am not trying to say that; no one with any common sense would say that.

Senator DANAHER. What I am trying to get at is there are other factors involved.

Mr. FRIEDMAN. Of course, nobody would say that was the sole factor, but if you take comparable periods the point which I have made here becomes evident.

4. *Capital gains rates versus capital gains tax-exempt income.*—When capital gains rates are high, there is a penalty on risk money. Then the percentage of income from tax-exempt securities rises. From 1917 to 1923, under high rates of tax on capital gains the percentage of total income derived from tax-exempt securities rose from practically zero to 12 percent. When the capital-gains tax is low the percentage of income from tax-exempt securities declines. Thus from 1924 to 1930, under a low rate of tax on capital gains, such tax-exempt income declined from 13 percent to 7 percent. By 1934, when rates were again high, the percentage of tax-exempt income rose to 26 percent. Apparently high capital-gains taxes push risk money into hiding. Of course, the lowering of the income surtaxes 1924–30 had an important bearing as well (p. 32). If capital-gains tax rates were fair, capital would venture out of the tax-exempt "storm cellar."

II. EFFECT ON TREASURY AND NATIONAL ECONOMY

A. *The capital-gains tax is still in the experimental stage.*—Certainly, the final stage of capital-gains taxation has not been reached. For this purpose, the Treasury will have to prepare much more complete data. Receipts from capital-gains tax will have to be segregated from income taxes in general. Losses in actual tax receipts from regular income arising from deductions under the capital-gains tax will have to be specified by years. A classification of Treasury receipts by income groups of capital gains will have to be correlated with the various laws. A study of the effect of capital-gains taxation on free flow of capital and on new risk enterprises can be traced only generally. Various Government reports indicate that the capital-gains tax methods "are arbitrary and inequitable." Members of the Joint Legislative Committee on Taxation of the House and Senate have likewise expressed their criticism. This brief will attempt to apply constructively such criticism to the current tax bill.

B. *Little revenue is now produced.*—Such revenue as the Treasury now obtains is fortuitous and not the result of any calculation. No Treasury official can possibly estimate receipts from short-term or long-term gains or estimate diminution in tax receipts resulting from capital losses deducted from income. But, in addition to this direct loss to the Treasury, the freezing of securities and the immobilization of new enterprise has, in the opinion of one expert, caused a loss of tax revenue to the Treasury of $250,000,000 (Senate hearing on H. R. 9682, p. 653). The present capital-gains tax is not a revenue-producing measure. It is a revenue-preventing measure. It is a fund-freezing order.

Senator Connally, in the hearings before the Senate Committee on Finance on the Revenue Act of 1938, pithily summed up the whole problem, "If the holder does not sell, you do not get any tax" (Senate hearing on H. R. 9682, p. 107). The Governments gets no revenue from capital gains if the sales do no take place. The rate of tax determines whether the sale will or will not take place. The capital-gains tax has now become insignificant compared with the revenue it might produce if the law were revised with the prime intent of securing maximum revenue (Senate hearing on H. R. 9682, table 1, p. 472). For example, table 5 of the Vinson report, page 86, shows that whereas net capital gain was about 9 percent of the total income in 1936 of all reporting taxpayers, the income of a million to one and one-half million showed only 1.9 percent, incomes $3,000,000 to $4,000,000 showed 1.6 percent, and incomes of $4,000,000 to $5,000,000 showed no percent. The capital-gains tax was paid, not by the rich groups but by the low-income groups. Rates can be so high as to be nonproductive. The Treasury suffers a direct loss when it discourages sales to cash in profits.

When the rates were low the percentage of tax on capital gains to total individual income-tax liability was relatively high, about 33.5 percent, in the period 1926–27, about 41 percent for 1926–29, and about 28 percent for 1926–32. (See Senate Finance Committee Report, 1938, p. 708) When the capital-gains rates were high, as in the period 1933–35, the percentage of estimated net tax on capital gains and losses to total individual income-tax liability was only about 7.7 percent.

The exact figures are not published since 1935, but Treasury officials estimate their figure was less than 5 percent in 1939 and 1940. It may be 1 percent—they will not say.

The higher the income of the group, the worse was the performance, insofar as Treasury receipts from capital-gains tax were concerned (Senate hearings on H. R. 9682, pp. 248 and 708).

C. *Price fluctuations are exaggerated.*—Because a high rate of tax on capital gains prevents sales, the market becomes artificial. The Government becomes a great manipulator. Without malicious intent, the Government creates instability which would be regarded as a social danger if created by any group of operators. Volume is reduced. Markets become thin. Selling near the peak of a boom is deterred for many unrealized gains are in the so-called short-term class, subject to high tax rates. A stable market is essential for new issues for expansion of private enterprise, or for selling United States defense bonds. The Treasury Statistics of Income for 1938 and for 1939 show that most of the short-term capital gains were taken by the groups with low incomes, under $5,000. Practically no short-term capital gains were taken in the top income groups. Here is an ideal condition for market instability. The market is without leadership. There can be no courageous buying in a break or prudent selling in a boom. It is a market dominated by a mob. And, therefore, in 1937, 1938, and 1940, the market has been characterized by hysterical market declines, worst in history up to then.

A good speculator should buy low and sell high. If he is successful, he performs a public service. He is optimistic in a break and pessimistic in a boom. There are too few of him. For this service to the public he should receive a reward. But the capital gains tax punishes him. Or it prevents him from exercising the function of stabilizer. The market is left to the lambs and the herdminded.

D. *The mischief of the 2-year holding period.*—Because the law fixes an arbitrary holding period of 18 months to 2 years before capital gains can enjoy the advantage of the lower rate of tax, markets are made even more unstable. In 1937 a speculator who took some profits in the spring on 2-year holdings was virtually compelled to sell in the autumn to register losses in new 2-year holdings to offset the earlier profits. If there were no fixed period, it would be possible for an investor to sell all of his holdings both over and under 2-year limit on the rise in 1936 and hold his cash until the market had declined substantially. No 2-year time limit would check sales. In this event, the investor would keep the profit and the Government obtain a tax. If the investor must hold for 18 months or 2 years, he loses his profit and the Government receives no tax. The 2-year period is a fund-freezing order and not a revenue producer.

Of course, the whole concept of a fixed holding period is artificial as various Government reports concede. High capital gains taken in 18 months plus 2 days pay 20 percent, and gains taken in 18 months minus 2 days might pay 75 percent. Such a law defies logic, ethics, or common sense.

E. *Inequities of current capital gains tax provisions.*—When the capital gains provisions were equitable and short-term gains were taxed at full income tax rates, then short-term losses were deductible at full income tax rates. Treasury receipts thus were reduced in

periods of deflation when Budget requirements increased. To obviate this difficulty, the law was changed so that short-term gains are regarded as income and are taxed as such, but short-term losses are not deductible from income. This was regarded as unfair in a Government report (Hill report, p. 35):

> While your subcommittee believes that the protection of the income-tax revenue necessitates a general adherence to the limitations upon the deduction of capital losses imposed by the Revenue Act of 1934, it recognizes the existence of a widespread feeling among taxpayers that it is inequitable and arbitrary to include capital net gains in the tax base for progressive income taxation while at the same time refusing to take account of capital net losses. The existence of this feeling among the body of taxpayers, whether or not entirely justified, is prejudicial to the maintenance of proper relations and necessary cooperation between the Government and its citizens in the administration of the revenue laws.

This defect could be obviated if all capital gains would be removed from the category of the graduated income tax without distinction of long or short periods of holding, as shown below.

F. *New ventures checked.*—Senator Connally pointed out in the hearings on the 1938 revenue bill that capital gains tax can check business. The official report of the Senate Committee on Finance states:

> Thus, an excessive tax on capital gains freezes transactions and prevents the free flow of capital into productive investment. The effect of the present system of taxing capital gains is to prevent any individual with substantial capital from investing in new enterprises. This is most unfortunate, because it adversely affects the employment situation (Senate Finance Committee Report, 1938, p. 6).
>
> The committee is convinced that at the present time transactions are prevented by the capital gains tax and that the result has been a material hindrance to business and a considerable loss of revenue (Senate Finance Committee Report, 1938, p. 6).

This defect has been recognized in preceding Government reports:

> The conclusion has been definitely arrived at that normal business transactions in respect to the sales of real estate, stocks, bonds, etc., will not occur under high surtaxes and that it is to the advantage of the Government from a revenue standpoint to give some relief on long-term gains. It has not been proven, of course, that our present system is the best obtainable (Hill report, 1933, p. 35).

Yet no substantial relief has yet been granted. This Congress has the power to carry into effect recommendations made in both the House and Senate committee reports of 1934 and 1938.

New small enterprise involves high risk. The failure to develop small- and medium-sized business may be partly due to the fact that capital has been so heavily penalized both through the high capital gains rates as well as from inability to make offset of capital loss that risky and potentially profitable businesses languish for lack of suitable backing. Risk capital comes from the few. But these are subject to the high rates applicable to short-term capital gains.

As a defense problem, what is most needed now is the development of mines producing defense minerals, and also residential housing in defense areas. Our defense program requires a modification of the capital gains tax provisions.

The deterring effect of a restrictive capital gains tax is felt particularly in those sections of the United States which have substantial resources. The South and West would benefit particularly from a practical revision.

Most important of all, the Treasury drive to sell defense bonds requires a mobile fluid capital market. The holding period in the capital gains tax tends to immobilize funds which could, should, and would go into Government bonds. The requirements of defense financing would justify a liberization of the capital gains tax law.

III. CAUSES, PARADOXES, AND ERRORS

A. *False concept of income.*—The basic causes of the difficulties of capital gains taxation is the fundamentally false concept of what constitutes income. There is no definition of income by any competent accountant which would justify the identification of capital gains with income. Value represents a capitalization of income. Differences in value depend on earnings and the appraisal of earnings and future prospects. This difference in value represents capital gain or loss, but obviously not income. For example, income may decline but it cannot go below zero. A case where an income can become minus is where the office boy pays the boss. Income is always there to be taxed. But capital gains may and very often have gone below zero, become a minus or capital loss. Another vital difference is that income can persist year after year. In fact, salaries do persist. Dividends persist, generally. But speculative gains do not.

The facts are clear. The Government report shows for 1917 an excess of capital gains over losses, but the next 5 years an excess of capital losses over capital gains (Senate Hearing on H. R. 9682, p. 245). Similarly, there was an excess of losses over capital gains for 1930, 1931, 1932. The years 1938, 1939, show an excess of long term capital losses over long term capital gains (Statistics of Income, 1938, p. 10, Statistics of Income, 1939, p. 20).

Again, there is clear evidence that over a period of 20 years net capital loss exceeded net capital gains for several groups of million-dollar incomes.

1. *Capital gain is not income.*—Capital gain represents a shift of assets between two persons. The income of the country is not increased or decreased because of the shift. When individuals' incomes rise the national income rises, but when some individuals gain on switching assets the national income is unaffected. Viewed as a whole, the Treasury's efforts to tax capital gains is fiscal rainbow chasing. The Treasury suffers from the same illusion that the American investment trust do. When prises rise and the portfolio increases in value, some trusts pay a dividend out of the increase. Then when prices fall, the portfolio shows a deficit, so that the dividend was really paid out of principal. In Great Britain, both the Treasury and investment trusts ignore capital gains. The British Treasury assumes that losses will offset gains. The British trusts put their realized gains into a reserve account to take care of expected losses, generally realized subsequently.

In this sense the tax on capital gains is not really income tax but a tax on capital—a capital levy—a sort of instalment upon an ultimate inheritance tax. This view is supported by court decisions. In the case of a trust fund, the capital gains may not be paid to beneficiary entitled to income and capital losses of trust fund may not be deducted from such income.

B. *Capital gains and inflation.*—The fictitious character of the capital-gains tax is indicated in two Government documents. Both show that capital gains may indicate not an increase in real value but only in monetary value.

In many instances, the capital-gains tax is imposed on the mere increase in monetary value resulting from the depreciation of the dollar instead of on a real increase in value (Senate Finance Committee Report, 1934, p. 11).

A large part of our tax on capital gains is derived from the taxation of appreciation in money value as distinct from actual value. In other words, a large tax is derived from these provisions merely because of the reduced purchasing power of the dollar (Report, Capital Gains, p. 2).

The present trend toward inflation with the accompanying rise in the value of all assets makes it particularly important to reconsider the capital-gains tax. The present tax would be not a tax on enrichment but a tax on impoverishment. The experience of inflation of Europe has been that no assets rose as fast as the currency depreciated, except gold or gold currencies.

C. *Tax on capital gains is contingent, not absolute.*—The most unique and most significant characteristic of the capital-gains tax is that it is contingent. This view was clearly stated by Senator Connally.

It seems to me there is a differentiation between ordinary income and income from capital gains. In the case of ordinary income, the taxpayer has to pay it; he has no choice. But in the case of capital gains he has a choice; he does not have to realize unless he wants to. We will get that revenue on ordinary income but we will not get it from capital gains unless he realizes it (Senate Hearing on H. R. 9032, p. 702).

It is also stated effectively in the report of the Senate Committee on Finance—

There is an essential difference between income derived from salaries, wages, interest and rents and income derived from capital gains. It is always to the advantage of the taxpayer to receive the first class of income, no matter what the rate of tax as long as it is less than 100 percent. On the other hand, the tax in respect of capital gains is optional. The taxpayer is not obligated to pay any tax unless he realizes a gain by the sale of the asset. "There is no tax under existing law if a taxpayer transfers his money from one bank to another, but there may be a very heavy tax if he wishes to transfer his investment from a bond in one company to a bond in another company (Senate Finance Committee Report, 1938, p. 6)—

or if he exchanges two similar stocks like Westinghouse and General Electric or if he exchanges any security into a United States defense bond.

The report of the House Committee on Ways and Means on the same revenue bill likewise states:

It must be recognized that differences exist in the characteristics of ordinary income in comparison with the characteristics of income from capital gain. For example, no matter how high the rates, a taxpayer always benefits from an increase in salary. On the other hand, there is no tax on the appreciation in value of property unless such appreciation is realized through sale or exchange. Thus, it becomes optional with a taxpayer whether to pay a tax on capital gains since he avoids the tax by refraining from making the sale (House Ways and Means Committee Report, p. 7).

In capital gains, however, he decides whether or not to realize the gain. That decision is affected by the rate. The Treasury is not the boss. The taxpayer is. Generally, however, he decides unwisely. A Wall Street aphorism runs—

The taxpayer who bases his market decision upon a capital-gains tax payment generally ends up by not having any tax to pay.

But the Treasury suffers through the taxpayer's folly.

D. *Artificial distinctions—Speculation versus investment.*—Various Government documents emphasize the distinction between speculation and investment on the basis of the holding period. The Government assumes that securities are speculative if held for less than a certain period, say 1 year or 2 years. Securities become investments if held 1 day longer than that period.

Interestingly enough, the House report on the revenue laws of 1934 sensed the fallacy in the tax legislation.

> Your subcommittee recognizes that a classification based solely upon the period of holding is not an exact method for segregating speculative from investment transactions, but it appears to be the only practicable method and is believed to be a sufficiently fair criterion for practical purposes. (Vinson Report, p. 37).

Of course the time factor is artificial, irrelevant and irrational. A widow buying a Government bond and selling it in 2 months for some reason or other still is an investor. The financial backers of a prospect or a new mine are speculators even well after the 2-year period. The time factor is meaningless. The intent is decisive. The 2-year time limit has been meaningless. Look at the stock market charts. What 2-year period, except for the period March 1935–March 1937, can one find from 1929–41, which showed a continuing market rise? The world is plunging at the speed of an avalanche, but the investor is supposed to sit quietly for 2 years. The Treasury states that it is on a 24-hour basis but under the present capital gains tax the investor must be on a 2-year or 17,520-hour basis.

IV. RECOMMENDATIONS FOR LEGISLATION

The preceding study showing the defects of our capital gains tax legislation and the cost thereof leads inevitably to recommendations for legislation.

A. *Segregate capital gains and losses from regular income.*—Such segregation would increase revenue, improve the workability and raise the ethics of the law. Under such segregation no capital losses can be used to reduce the regular other income subject to the graduated tax. Great Britain levies no tax on capital gains and her tax receipts are more stable.

B. *Restrict offsets of losses to segregated gain.*—However, all capital losses could be offset completely and without limit against all capital gains.

C. *Set a rate to produce maximum revenue.*—Certainly a low flat tax on capital gains, regardless of the holding period or the time of realization, would produce revenue, because it would not discourage or prevent holders from selling when the price seems high and from buying when the price seems low.

Senator Connally stated with admirable frankness:

> I am coming around to the view that as to capital gains and losses we should make it more attractive to a man to sell instead of offering him a premium to hold.

What rate would produce most revenue? Obviously the lower the rate, the greater is the incentive to take a risk and the greater the revenue to the Government. Would it not, therefore, seem desirable to experiment for a period of 1 year with a new low flat rate, perhaps 10 percent? It will probably produce a higher revenue than ever before.

D. *Eliminate the holding period.*—The holding period is arbitrary, as congressional reports admit. It ties the hands of anyone who would buy or sell in anticipation of some unforeseen contingency like the coming of peace, the emergence of a crisis, economic, or political. It prevents the Treasury from getting revenue on fluctuations in the market lasting less than 18 months. Since 1929 the markets rose only once for 18 months consecutively. Of course, under the S. E. C., manipulation by pools would be prevented.

E. *Carry losses forward during one whole business cycle.*—The business cycle runs generally about 33 months. It should be satisfactory to have a carry-forward privilege of 2 years or at most of 3 years. The shorter period would benefit the Government revenue. Since the retreat of capitalism for a decade, net capital gains accrue only as a result of the business cycle, not of long-term trend. The carry-forward period should conform to the business cycle and not to any arbitrary period like a year.

F. *Tax gains of professional traders at income-tax rates.*—A professional market operator makes his living out of trading to catch capital gains. His business is to try to stabilize the market. Therefore his gains and losses come under the category of ordinary income. Traders or professional speculators whose annual income consists of accumulated capital gains should be taxed differently from the rest of the several million stockholders who trade infrequently, and with whom capital gains may be followed, and generally are followed, by capital loss for 2, 3, or 4 years, as in 1930 to 1933.

Certain administrative standards would have to be set up to classify professional traders and investors. Speculation might be defined in terms of margin purchases, as against outright purchases by investors. Frequency of transactions might be another standard. An investor might be limited to two turns in the market, in and out, per annum for his whole list. Intent would be the determining factor. Certainly, stock specialists, floor traders, arbitrageurs, etc., would be in the professional category. Appeals from a decision as to status of professional speculator or private investor could be made to a board of review representing Government officials, businessmen, accountants, and tax advisers.

G. *What data must the Treasury furnish for Congress?*—Statistics of the capital-gains receipts are merged in the record with the regular income tax. Congress is, therefore, in a position of a blindfolded boxer, hitting wild.

Since 1917 there have been a great number of variations in the capital-gains tax. We changed the holding period. We separated long- and short-term gains and losses. We permitted, prohibited, and then limited deduction of losses from gains, long-term and short-term. There is no clear record of what were the results of the various procedures. Imagine a physician changing treatments and not recording the results. We have changed the rates from 12½ percent up to the maximum income-tax rates and down to 15 percent, but no one has compared the effect on the volume of tax receipts. We have had carry-over of losses for varying periods. The data in the Treasury has not been studied or presented. There can be no intelligent legislation on the capital-gains tax until the facts are presented.

The Joint Congressional Committee on Taxation should insist on having for the entire period of capital-gains tax legislation 1913–40 adequate statistics to show the effect on the volume of revenue as several features of the law were changed. The Treasury should furnish the following data:

(*a*) Losses to the Treasury from deducting capital losses from regular income, 1917–40.

(*b*) Short-term capital gains, short-term capital losses, and net excess, 1917–40, showing the features of the legislation then effective with respect to rate, holding period, offsets, etc.

(*c*) Similar data on long-term capital gains and losses.

(*d*) Both the long-term and short-term gains and losses should be classified by income groups. This would show the effect of rising tax rates upon the volume of Treasury receipt from the various groups.

From the little data thus far available, the evidence is clear that the groups in the brackets of low income and low rates tend to pay relatively more to the Treasury on short-term capital gains than do high incomes and high rates as shown above.

V. BENEFITS

A revision of the capital-gains tax in the light of adequate statistics by the Treasury would have important benefits to the Treasury, to the general economy, and particularly to the defense program.

A. *Revenue from capital-gains tax would increase.*—Revenue from capital-gains tax would increase. A simple calculation will make it possible to estimate how much additional revenue the Treasury would receive if the short-term rates were lowered to the level of current long-term rates. Assuming that the amount of the short-term gains bears the same proportion to the long-term gains for all groups as for incomes under $5,000, or that the higher income brackets paid the same low rates on short-term gains as on long-term gains, the Treasury could tax in 1938 an additional source of over $250,000,000.

Furthermore, in 1938, capital losses of $584,000,000 were offset against regular income. The two items would increase total taxable source by over $830,000,000. This is not an insignificant item. Compare it with the trifling amounts received from the various excise and luxury taxes on which much time and effort is spent both in discussion and in administration. There are billions of dollars of long-term capital losses on shares bought from 1926 to 1930 lying in wait to "soak the income tax."

Lacking the foregoing statistics, which the Treasury should furnish, one can attempt to estimate de novo what a capital-gains tax should yield under the following conditions, viz: (*a*) no time limit on holding, (*b*) a low flat tax, say 10 to 15 percent on all gains, short term as well as long term, (*c*) segregate capital gains from regular income and allow no offset of caiptal losses against regular income, (*d*) carry forward of losses for 2 or 3 years. The value of all shares listed on the New York Stock Exchange fluctuates from lowest point to highest point, from about $10,000,000,000 to $20,000,000,000 per annum. As against this net change in value from top to bottom, the total fluctuations or "travel" would be about three to five times as great, say $30,000,000,000 in a dull year to $100,000,000,000 in an active year according to H. M. Gartley, market analyst.

If some fluctuations could be cashed in as profits or as capital gains, then on the basis of past experience the yield should range between $100,000,000, or 0.33 percent, in a quiet year, to $650,000,000, or 0.65 percent, in an active year, on so-called short-term gains within any year. These amounts are far higher than the Treasury has been receiving since 1929. To this would have to be added tax receipts on longer held securities.

B. *Other phases of national economy would benefit.*—Other phases of national economy would benefit. Capital now frozen would become mobile. New enterprises, particularly small business, would revive. New sources of Treasury revenue would be opened up. Not least, the receipts of the Federal and State Governments from stock transfer tax would double, and this would amount to about $18,000,000 for the Federal transfer tax and about $21,000,000 for New York State transfer taxes.

C. *The defense program strengthened.*—The defense program would be strengthened. Capital now locked up could go into the development of mining defense minerals, now languishing for lack of risk capital. Furthermore, investors' portfolios now frozen by the 2-year holding clause deter them from subscribing to Government defense bonds. Abolition of the holding period and a low capital-gains tax would make capital resources available for subscription to bonds for the financing of defense by negotiable bonds.

The evils of the present capital-gains tax are patent. The causes are clear. The foregoing analysis indicates the remedy. Congress should act.

TABLE V.—*Relation of tax rates to gain and loss realized*

[Net gains and losses from sales of assets realized by individuals with net incomes of over $1,000,000 in 1924 and whose aggregate net gain from the sale of assets in the years 1926 to 1929, inclusive, were more than 50 percent of their net incomes for those years]

Variations in capital gains tax rates and in profits			Percentage of net gains to total income	Percentage of net losses to total income
Period	Profit trend	Tax rate		
1917 to 1921	War period	High	0.89	24.39
1922 to 1924	Moderate profit	Moderate	47.96	13.06
1925 to 1929	High profit	Low	66.18	1.81
1930 to 1931	Falling profit	do	29.97	49.74
1932 to 1936	Recovery	High	10.50	50.21
Grand total			47.43	15.16

Note that high rates of tax on capital gains cause realization of small gains and large losses. Low rate of tax on capital gains cause realization of large gains and small losses.

TABLE VI.—*Relation of short-term gains taxed at high rates to long-term gains taxed at lower rates, and relation of gains to losses, by income groups*

[Net income classes and money figures in thousands of dollars]

Net income classes	Short-term capital gain, a	Long-term capital gain, b	Ratio percent, short term to long term, a/b, c	Net long-term capital loss, d	Net long-term balance, b−d +gain, −loss
(1)	(2)	(3)	(4)	(5)	(6)
Returns with net income:					
Under 5	45,824	30,335	151	151,209	−120,874
5 under 10	30,307	23,220	130	78,872	−55,846
10 under 25	30,674	32,641	91	90,120	−57,479
25 under 50	14,048	22,589	68	41,791	−19,202
Subtotal					−253,301
50 under 100	6,065	20,818	32	20,404	+414
100 under 150	2,119	11,731	18	4,866	+6,865
150 under 300	1,138	19,011	5.7	4,332	+15,579
300 under 500	231	15,702	1.5	1,034	+14,668
500 under 1,000	244	21,868	1.1	1,651	+20,217
1,000 and over	175	60,762	0.3	502	+60,260
Subtotal					+118,003
Total	131,425	259,582	50.6	394,781	−135,199
Returns with no net income	7,684	6,367		189,332	−182,965
Grand total	139,109	265,949		584,113	−318,164

Note that the higher the income and the income-tax rate applicable, the lower the short-term gain realized in relation to long-term gain realized. Note also that the high-income groups furnished tax revenue to the Treasury on $118,003,000 of gains realized, and the lower income groups actually diminished Treasury tax receipts by charging off losses of $436,166,000 against regular income.

STATEMENT OF HARRY M. RIGHTER, SULLIVAN, ILL., REPRESENTING EASY CIGARETTE MAKER CO.

The CHAIRMAN. Give your name, please.

Mr. RIGHTER. Harry M. Righter.

The CHAIRMAN. On which question in this tax bill are you appearing?

Mr. RIGHTER. Not anything put into the bill this year, but on the tax on papers. There are now three different tax rates on the iden-

tical commodity. That is the tax on the papers people use in making their own cigarettes, if cigarette papers are put in books of less than 25, they are tax-free; if put in books containing 50 papers, they are charged at the rate of one-half cent on each 50, and if made into tubes and put in packages like this, then the tax is one cent per 50.

Now, I am not interested in which rate is used, but it should be the same rate on all of them. What has happened is that the tobacco companies putting out these machines, like this [indicating] are evading taxes by putting duplicate numbers of these tax-free packages in tobacco package instead of putting in a single tax-paid book. What I would like to eliminate is the three different rates and make only one rate. The major amount of it is used in this particular package of tobacco here, and beginning in the year 1932—these are from the internal revenue figures, these figures jumped that year for the use of free booklets more than 100 times the previous year and in that same year the number of ready-roled cigarettes dropped about 13,000,000,000, so that the Treasury is not getting any income from these papers, and the major companies are able to avoid the tax by putting in a number of free booklets where they should, in my opinion, be putting in one book of tax-paid papers.

We manufacture these [indicating]. If we put 1 in a box, we pay 1 cent on each, whether 1 or 50. Now, what I wish to see is that they should all be taxed the same. If these free books were eliminated, the Treasury would receive about $5,000,000, and if on the rate we pay on this, $10,000,000, which at the present time is not coming into the Treasury but is being evaded by the use of a number of tax-free books instead of one tax-paid book.

I have here a number of figures taken from the Treasury on the amount, and as near as I can figure there is a 20-percent loss of number of paper, meaning that about 20 percent of papers received with tobacco are not used. Twenty-eight percent of all the cigarettes smoked last year were made by hand. Those are Treasury figures, and of that amount 73 percent used these tax-free papers. What I wish to say is that if they are going to have free papers at all I would like to have them all in the same category.

The CHAIRMAN. Do you know what the yield is on this?

Mr. RIGHTER. Yes.

The CHAIRMAN. How much is it?

Mr. RIGHTER. The tax-paid number here in 1940—the Treasury received $12,500, and if they hadn't allowed them to avoid the payment of the tax by having this in here, they would have gotten $5,000,000. If they had made them pay a tax on the papers from one up, they would have gotten something like $5,000,000; actually it was only about $12,000.

The CHAIRMAN. Your position is, if taxed at all, the tax should be uniform?

Mr. RIGHTER. Yes.

The CHAIRMAN. Any questions you wish to ask?

(No response.)

(The tabulation submitted by Mr. Righter is as follows:)

Cigarette papers and tubes withdrawn during the fiscal years as indicated

Fiscal year	Tax-free papers withdrawn			Tax-free papers at average 24 papers per package, book, or set	
	Domestic packages, books, or sets (1)	Imported packages, books, or sets (2)	Total packages, books, or sets (3)	Individual papers (4)	After deducting 20 percent for wastage (5)
	Number	*Number*	*Number*	*Number*	*Number*
1940	2,276,827,218	400,000	2,277,227,218	54,653,453,232	43,722,762,586
1939	2,160,304,855	1,040,000	2,161,404,855	51,873,716,520	41,498,974,000
1938	1,952,699,101	500,000	1,953,199,101	46,876,778,424	37,501,422,000
1937	2,711,851,987	800,000	2,712,351,987	65,096,519,688	52,077,216,000
1936	2,860,219,326	1,333,333	2,861,552,659	68,677,263,816	54,941,811,000
1935	2,684,926,917	2,482,499	2,687,409,416	64,497,825,984	51,598,261,000
1934	1,930,133,447	539,025,666	2,469,159,113	59,274,218,712	47,419,375,000
1933	1,458,496,429	457,074,483	1,915,570,912	45,973,701,888	36,778,962,000
1932	1,018,676,818	242,599,233	1,261,276,051	30,270,625,224	24,216,500,000
1931	112,462,049	99,030,432	211,492,481	5,075,819,544	4,060,656,000
1930	28,952,334	107,040,000	135,992,334	3,263,816,016	2,611,053,000
1929	127,069,562	188,948,000	316,017,562	7,584,421,488	6,067,537,190
1928	186,250,224	208,171,000	394,421,224	9,466,109,376	7,572,887,501
1927	219,323,959	288,048,320	507,372,279	12,176,934,696	9,741,547,757

Fiscal year	Tax-free papers at average 20 papers per package, book, or set		Papers tax-paid at 1 cent per 100	Tubes tax-paid at 2 cent per 100	Total papers and tubes (columns 7, 8, and 9)
	Individual papers (6)	After deducting 20 percent for wastage (7)	(8)	(9)	(10)
	Number	*Number*	*Number*	*Number*	*Number*
1940	45,544,544,360	36,435,635,488	12,522,524,000	137,486,800	49,095,646,288
1939	43,228,097,100	34,582,477,680	14,779,317,600	76,409,500	49,438,204,780
1938	39,063,982,020	31,251,185,616	11,706,029,800	58,359,100	43,015,574,516

1933	38,311,418,240	30,649,134,592	9,185,528,400	197,598,700	40,032,261,692
1932	25,225,521,020	20,180,416,816	16,452,419,500	276,576,650	36,909,412,966
1931	4,229,849,620	3,383,879,696	14,379,999,700	19,020,698	17,782,900,094
1930	2,719,846,680	2,175,877,344	13,205,761,200	15,998,000	15,397,636,544
1929	6,320,351,240	5,056,280,992	11,763,455,300	15,900,000	16,835,636,292
1928	7,888,424,480	6,310,739,584	11,179,987,700	29,055,250	17,519,782,534
1927	10,147,445,680	8,117,956,464	11,241,487,400	33,302,400	19,392,746,264

NOTE.—Taxes were first imposed on cigarette papers and tubes by sec. 404 of the Revenue Act of 1917. However, figures similar to the above are not available for the fiscal years 1917 to 1926, inclusive.
28 percent of all cigarettes were made by hand in 1940.
73 percent of all hand-made cigarettes used tax-free papers in 1940.

STATEMENT OF ALBERT J. HART, AMES, IOWA, ASSOCIATE PROFESSOR OF ECONOMICS, IOWA STATE COLLEGE

The CHAIRMAN. You may proceed.

Mr. HART. As you will observe from my address, I have come a thousand miles from Ames, Iowa, to appear before you today. The material which I have to present is a report made of a study involving several months' time of a number of economists at our institution. While I do not expect to require very much time, I shall not be able to avoid going into some statistical questions which are rather complicated and I suspect that both you and I could do more justice to the problem when we are fresh. Accordingly, I should like to ask to be heard tomorrow instead of this afternoon, if it suits the committee's convenience.

The CHAIRMAN. We have a full list of witnesses tomorrow. We would be very glad to have you file your brief for inclusion in the record if you care to, with such statement as you may care to make in the next few minutes, or if you prefer to take a chance on us running out of witnesses tomorrow and it is possible to do so, we shall be glad then to hear you. I cannot promise you anything definite. Proceed now, but we have a very few minutes.

You are talking about the effect of the tax on the spending power?

Mr. HART. What I am concerned about, sir——

The CHAIRMAN. You are not talking to any particular thing in this bill?

Mr. HART. Only in relation to the inflation problem, which you can see is a large subject.

The CHAIRMAN. Yes; we have some considerable number of people working on that now in other branches of the Government, but go ahead.

Mr. HART. I am handing an outline of my testimony in to the reporter for inclusion in the record. It also shows my professional training, position held by me, and other pertinent matter. May I ask that that be included in the record?

The CHAIRMAN. Yes; it will be.

(The outline of Mr. Hart's testimony is as follows:)

Name: Albert Gallord Hart.

Position: Associate professor of economics, Iowa State College, Ames, Iowa.

Professional training: Took A. B. in economics at Harvard, 1930. Took Ph. D. in economics at University of Chicago, 1936. In addition did graduate work abroad in 1930–31, 1934–35.

Professional positions held: Teaching assistant in economics, Chicago, 1932–34. Instructor in economics, Chicago, 1934–39. Economic analyst (on leave from Chicago), United States Treasury, summer 1934. Lecturer in economics (on leave from Chicago), University of California (Berkeley), autumn 1936. Director of research, Committee on Debt Adjustment, Twentieth Century Fund, 1937–38. Associate professor of economics, Iowa State, 1939 to date.

Publications: Economic Meaning of the Townsend Plan (pamphlet), Chicago, 1936. How the National Income Is Divided (pamphlet), Chicago, 1937. Debts and Recovery (report of Twentieth Century Fund), New York, 1938. Anticipations, Uncertainty and Dynamic Planning (monograph), Chicago, 1940. Economic Policy for Rearmament (pamphlet), Chicago, 1940. Coauthor, Paying for Defense, Philadelphia, August, 1941. Also articles, papers in symposia, etc.

Appearance: As representative of the group of 11 members of the economics staff of Iowa State College participating in the study of defense financing reported in Paying for Defense.

I. Importance of defense financing methods is not so much providing money for defense as steering incidental effects of defense into right channels:

(*a*) Under modern conditions, governments never run out of money because they can always borrow at banks.

(*b*) "Real costs" of war—use of manpower, materials, equipment to prepare and use arms rather than for peaceful production—are about the same in total amount however financing is done.

(*c*) Real costs must be shared somehow among the people. Public finance is chiefly a question of how they are shared.

(*d*) Any attempt to avoid sharing out the costs—i. e., to "let George do it" without deciding who is George—results in inflation.

II. Heavy tax increases are essential to block inflation:

(*a*) It is already agreed that our problem is no longer to forestall inflation—it has already broken out, and the problem is to set bounds to it. Pace may be seen in fig. 11 of book (p. 182).

(*b*) Inflation represents an increase of spending power without an increase of output to match it. It may be accentuated if speculation holds goods off the market; but this is not our trouble in most fields so far—witness the history of automobile-tire prices.

(*c*) Defense has reached the point of reducing our ability to put goods on the market for consumers, but is still boosting spending power.

(*d*) To drain off spending power is thus essential for blocking inflation. This means taxes, or loans with strong pressure to make nonbankers take them up (really taxes with promise of refunds).

(*e*) Inflation can in principle also be blocked by direct restrictions on people's spending (as in Germany). But there are no signs that such measures are being prepared.

(*f*) "Price control" as a remedy for inflation is a delusion and a snare if not backed up either by consumer rationing or by taxes. Its advocacy is a disguise of "business as usual"—it is another scheme for letting George do it without naming George.

III. The basic tax for draining off spending power should be a tax on personal income.

(*a*) Sales taxes or revenue excises (the only practical substitutes) fall most heavily on very low incomes. This results from the fact that a higher proportion of low incomes is spent. (See fig. 3 of book, p. 124.) The regressive effect is seen in figure 4 of book (p. 126).

(*b*) The amount of revenue needed is so great that raising it by a sales tax would call for rates of well over 10 percent at retail, so that this effect would happen on a large scale.

(*c*) Even token increases in the very low brackets can scarcely be justified in view of the existing heavy burdens shown by the Temporary National Economic Committee publication, Who Pays the Taxes (boiled down into fig. 2, p. 98 of book).

(*d*) Sales taxes are inefficient tools for combating inflation because they raise prices directly and because they are ineffective in reaching the upper-bracket spending on durable goods which is peculiarly dangerous.

IV. Besides the basic tax on personal incomes, however, we need others:

(*a*) To avoid discriminating in favor of undistributed profits, we must raise corporation rates along with personal rates.

(*b*) For reasons admirably summed up by Mr. Eccles in Fortune, we need heavy excess-profits taxes.

(*c*) Excises on goods which cannot be produced in full volume without hampering defense (as advocated by Mr. Henderson) are also essential.

(*d*) Corporation taxes must be kept in line with personal taxes; excess profits taxes and selective defense excises cannot be based primarily on revenue needs; so personal income taxes remain the basic tax, to be varied with defense requirements.

V. To make personal income tax effective calls for changing the income tax system:

(*a*) We need a much larger tax base, as may be seen from figure 6 of the book (p. 146), remembering that extra revenue needs may be $10,000,000,000 or more. This means a substantial lowering of exemptions—perhaps by half.

(*b*) We need prompt collection. Taxes are now collected about 13 months after taxed income is received; and this means that the effect on spending cannot be timed right. Prompt collection means partly taxation at the source, partly offering real incentives (not a mere 2-percent interest) for prompt payment in the upper brackets.

(*c*) These proposals do not conflict with the concern expressed above for the lower brackets. The added tax liability from lowering exemptions is in the middle-class brackets (see fig. 9 of the book, p. 158) and opportunity for installment payment at the source is a benefit to low-income taxpayers.

(*d*) These proposals are in line with those placed before the House Ways and Means Committee this spring by a group of 178 economists (77th Cong., Committee on Ways and Means, Hearings on Revenue Revision of 1941, revised, vol. I, pp. 360–367).

VI. If we hesitate to make tax measures drastic, it is "out of the frying pan into the fire":

(*a*) Tax collections are now at an all-time high; but so is the public's consumption.

(*b*) The effect of the pending tax bill on consumption spending will not be enough to set it back below prosperity levels; though physical production of consumers' goods will fall to depression levels in the field of metal and rubber products.

(c) To say that the public cannot stand taxes beyond the contemplated level is to say that the defense of democracy cannot be allowed to reduce consumption spending appreciably below its all-time peak, which is obvious nonsense.

Mr. HART. The group that I am representing consists of 11 members of the economics staff of Iowa State College, all of whom have spent a large part of their time in the study of defense financing for some months past. The report of our investigation was published yesterday by Blackiston Co. of Philadelphia under the title "Paying for defense." Through the courtesy of the Iowa Agricultural Experiment Station and the publisher I have had the first copies available sent here and am asking the clerk to hand one to each member of the committee. As you can see from the first part of the outline, our attitude is that the problem of defense financing is a problem of sharing defense burdens not merely a finding of money to pay for defense. Lack of money never stops war activities, and the mere provision of funds need not worry us.

What war really costs, whether or not the country in question is belligerent, is the use of manpower, materials, and equipment for military instead of civil purposes. Somebody has to go without the goods which these resources would otherwise have produced for civil consumption. No method of financing can prevent costs in defense from existing or can eliminate the problem of sharing out those costs among the people. Somebody in particular has to bear the cost. The question is whether to have a definite rule for sharing the cost or to involve ourselves in inflation. Inflation simply means that the people who do without consumption are the people who drop behind in the race to get increasing money incomes. Now, to the second point.

The need of heavier taxes, if we are to avoid inflation, is becoming acute. The problem is no longer to forestall inflation but to limit and control that which has already broken out. The seriousness of the situation may be seen from the diagram on page 182 of the book. The upper half of the diagram simply records the cost of living index for all the dates for which it has been quoted; the lower half shows charges in the index in percent per month. If you will look at the right-hand end of the lower curve you will see that the pace of the price advance the last few months has been much more rapid than in any we have experienced since 1920. This impression would be strengthened if we had been able to include July data in the diagram.

When inflation develops on consumers' markets, as it is doing now, this is evidence that consumers' spending power is outpacing the flow of goods on to the consumer markets. To check inflation in such circumstances involves either increasing the flow of goods or cutting down the flow of spending. The defense program puts it out of our power to increase output in many important directions and we have reached the point where some check on the increasing flow of spending power is essential.

There are some possibilities for checking spending without the use of taxes. It may be done by direct prohibitions on spending beyond a certain level in a country which has a well-organized rationing and price-control system. In fact, this is done in Germany, but we lack the machinery for such regulation and, for good reasons, American public

sentiment is not likely to favor setting up such machinery. There are also possibilities of draining off spending power by compulsory loans along the lines proposed by the English economist, J. M. Keynes. Devices of this sort are in use in England and in some of the dominions, but loans of this sort are in fact taxes coupled with a promise of an eventual partial refund. Essentially they are forms of taxation rather than substitutes for taxation.

Some hopes are held out that price control without either consumer rationing or taxation can block inflation. This notion, however, is a delusion and a snare; it is only fair to add that it is not a fair representation of the views of Mr. Henderson, who has often fought for drastic taxes to back up price control. Even if prices could be held down by such a program, which in the light of history is extremely doubtful, the problem of sharing the available goods among the public remains to be solved.

The third point is that the basic tax for draining off spending power should be a tax upon personal income. The principle of ability to pay excludes the use of sales taxes unless they are carefully limited to apply to commodities which are bought only by the more prosperous groups. This sort of taxation has been advocated before your committee—for instance, in the form of differential tax on the highest grades of clothing, and so forth, and in principle is entirely defensible. The British experience with the so-called purchases tax, which is of just this character, shows clearly that if exemptions are wide enough to protect the low-income people the tax base is destroyed. The goods consumed by people in the different income levels are so much alike that the goods which are not important articles of mass consumption are not important at all on the consumer markets.

The reason the general sales tax bears unfairly on low incomes may be seen at a glance in the diagram on page 124 of our book. Heights on the diagram represent amounts spent, and distances from left to right, amounts of income. It will be seen at once that the proportion of income spent decreases rapidly as we move up the income scale; at the $1,000 level everything is spent, at the $20,000-a-year level only about half.

On page 126 we show a resulting distribution of burdens in terms of percents of incomes. The three taxes represented in the diagram are calculated not to yield equal amounts of revenue but to reduce consumption spending by equal amounts, about 5 billion in each case. Since taxes on the upper income brackets reduce saving more and spending less than taxes on the lower income brackets, this reduction in the spending calls for about 10 billion of income tax and about seven and a half of sales tax, by our best estimates. I may say parenthetically, though, the details of these estimates are open to some question in view of the necessary round-about statistical methods used, but we have confidence that the general results are reliable.

Senator BARKLEY. Can you regulate inflation by taxation without hitting a lot of people they do not inflate?

Mr. HART. No, sir; I am afraid we cannot. In a sense, the people responsible for inflation are the people whose incomes are rising and, therefore, have more to spend.

Many of these people are so low in the income scale that I feel they should be excused entirely from paying defense taxes. If the man

with a large family gets his income up from $20 to $30 a week, I cannot see that that makes him a fit object for taxation. People whose incomes are not rising will surely feel it if we make income taxes heavier; that is, if their incomes are above the exemption level—and I am recommending much lower exemption levels. But, of course, either a sales tax on a necessary scale or rapid inflation would also be very unpleasant for the fixed-income people.

As you can see from our diagram on page 126, a sales tax to reduce spending by the amount in question would have to be a jumbo tax. In fact, we estimate that a general sales tax, to have this effect, would have to be about 16 percent at retail and a similar tax, exempting food, 28 percent; for a manufacturers' sales tax the rates would have to be higher. Taxes on this scale would take as much as 10 percent of income at the income levels in a range from, say, $500 up to $2,000 per year per family. In view of the existing heavy burdens on those classes, which are officially estimated to amount to more than 20 percent of income, taxes which will do this cannot be justified, even in the present emergency.

I wish to stress also that sales taxes are inefficient tools for reaching the consumption spending which is most important in raising prices. The goods of which we are short are very largely consumers' durable goods of types chiefly bought by the upper-income brackets. The lower-income brackets buy largely goods whose production can still be increased, like cigarettes and moving picture shows. Even taking a completely hard-boiled attitude about the relative claims of the more or less prosperous groups in the population, the necessity of taxing the people whose spending strikes the scarcest goods cannot be denied.

As the fourth point of the outline indicates, we do not wish to be understood as opposing a proper program of taxes other than income taxes. We see a great field for excess-profits taxes and agree with Mr. Henderson on the advisability of heavy excise taxes on goods which cannot be produced in volume without hampering defense. In this connection I should say that the House Ways and Means Committee appears to have made a great effort to eliminate proposed excise taxes not of this character. Mr. Henderson estimated that 85 percent of the originally proposed excise revenue was from items not competing with defense. Under the bill as it came to you from the House, 50 percent instead of 15 percent of the revenue can be defended on Mr. Henderson's grounds, and a large part of the residue is represented by taxes on the use of automobiles, which are correct in principle but incorrect in form.

Taxes which cut down the use of automobiles can economize labor, gasoline, transport, mechanical services, spare parts, and a lot of other things which compete with defense. The trouble with the proposed tax is that it doesn't tax the use of cars by the mile. Possibly a few cars will be left unregistered to avoid the tax; but once a car is registered the tax comes along and gives no inducement to reduce the mileage. From a standpoint of defense a revival of the proposed increase in gasoline taxes would be a more satisfactory substitute.

The CHAIRMAN. What about a combination of sales and income taxes?

Mr. HART. I should not be for it. On the other hand, selective taxes on commodities conflicting with defense do not seem to me to work like general sales taxes. They really apply to and belong in the class of specialized excess-profits taxes. We argued that question at some length, I might say, in chapter 13 of the book.

Besides excess-profits taxes and and excises along Mr. Henderson's lines, we believe in the desirability of raising a general corporation income tax in line with individual taxes, as is in fact the policy expressed by the pending bill, though we believe that the individual income tax must be made substantially higher for two reasons. In the first place, these other taxes used to legitimate limits will not drain off enough spending power to do the job of blocking inflation, in our judgment.

In the second place, it looks as if these taxes will not be used up to a legitimate limit and in that case personal income tax is certainly a very much better second choice than sales taxation.

As I point out, under the fifth head of the outline, the personal income tax will have to be reformed before we can really count on it to do the job of stopping inflation. There are two difficulties. In the first place, present exemption levels, provisions for deductions, and so forth, are so generous that a remarkably small proportion of the national income is actually subject to tax. We present on page 146 of the book a diagram which shows what becomes of the potential tax base. The lowering of exemptions recommended by the Treasury will be a long step toward the correction of this deficiency. We may find it necessary eventually to cut exemptions in half from the 1940 levels, though I should certainly recommend maintaining the credit for dependents at the present level.

The importance of prompt collection is perhaps less understood. In view of the very short time in which you are obliged to limit me, I should welcome an opportunity to insert in the record an admirable article by a leading English student of public finance, Mrs. Ursula K. Hicks. This article is a brief report of an extensive study of the history of war finance in a number of countries and shows conclusively that a slow-acting tax system is likely to fail in the pinches.

The CHAIRMAN. How long is it?

Mr. HART. Here it is [indicating volume].

The CHAIRMAN. We don't want to make it too long. If you can shorten it, we will be very glad to include it.

Mr. HART. Perhaps I can shorten it.

(The matter referred to follows:)

LAGS IN TAX COLLECTION—A NEGLECTED PROBLEM IN WAR FINANCE

One of the most striking features of the financial history of the last war was the universal failure of the belligerent governments to collect an adequate tax revenue during the actual period of the war. The worst case of all was that of Imperial Germany, where total tax revenue hardly kept pace with the normal peacetime needs of government and the whole of the war expenditure was financed by borrowing. More than two-thirds of the revenue received from the special war taxes was not collected until after the war was over and when the mark was rapidly depreciating.

The case of France was hardly better. In the early years of the war tax revenue actually fell as compared with the pre-war situation. Throughout the war period revenue barely sufficed to cover ordinary expenditure. Up to December 1919 the excess-profits tax had brought in no more than 1.4 milliard francs, although eventually something like 18 milliard francs was collected.

In America, where things might have been expected to be better, the collection of income and profits taxes was 25 percent in arrears in 1918, and the peak tax collection did not come until 1920.

In Great Britain the general fiscal situation was fairly well under control. Throughout the war period between 20 and 34 percent of total expenditure was annually financed out of revenue. But the problem of arrears was hardly less serious, especially in respect of E. P. D. In 1918 its arrears amounted to 164 pounds mn., by 1919 they had increased to 217 pounds mn. The maximum tax collection was realized in the financial year 1919–20, when the postwar boom was already showing signs of cracking.

For some of these failures obvious explanations suggest themselves. France and Germany both had quite inadequate revenue administrations, and in addition that in Germany was very inexperienced in direct taxes. But the charge of incompetence cannot be brought against the United States Bureau of Internal Revenue; and, in any case, the war strain in America was much less severe. British and American experience clearly demonstrates that the prompt and adequate collection of tax revenue during war conditions is a matter of no little difficulty.

Unless the lag in tax collection can be removed, it is clear that taxation, one of the most important instruments for the control of consumption in wartime, is really much less useful than it is generally held to be. This is a very serious matter. There is inevitably some rise in prices in war conditions, and partly as a consequence there is a very rapid rise in incomes, particularly during the early stages of expansion for war purposes. In these circumstances the tax currently collected, being only that appropriate to the old lower incomes and prices, can have only a relatively small effect. In respect to the old incomes it would no doubt be a heavy burden, but in respect of the new incomes it is not a heavy burden—not nearly so heavy as it is intended to be. Its power of controlling expenditure is inevitably disappointing.

It may be objected that taxpayers do not spend balances which they know will shortly be required to discharge tax liability. In normal times this is no doubt true. But when prices are rising there is a very strong temptation not to keep adequate liquid balances, since to finance even the existing scale of operations or consumption requires additional expenditure. To leave large sums in taxpayers' hands for a period of months is thus exposing them to a very grave temptation to spend their tax quotas. The fact that tax is collected not on current but on past income is indeed tantamount to giving taxpayers a loan out of public money from the moment when the incomes are earned to that at which the tax is paid. This is clearly the reverse of what is desirable. So far from taxation exercising an adequate control over consumption, the lag in collection may actually minister to inflation.

The first necessity of a wartime tax structure is, thus, that it should be capable of producing revenue quickly. This implies that weight must be put, in the first place, on taxes that have a naturally quick reaction; and in the second, on those which are easy to collect. New taxes are always slow taxes, whatever their inherent rate of reaction, because they require the setting up of new fiscal machinery. Special taxes of an emergency or temporary nature are usually abnormally difficult to collect, because they can more easily be evaded than permanent taxes. Germany's total failure in the last war can largely be ascribed to the fact that she tried to rely wholly on emergency taxes. The French taxes were of a more reliable nature—more akin to the British income tax than anything which had previously been attempted there. But for France they were new taxes, and the result was hardly better. The relative success of Britain was largely due to the fact that she already possessed an excellent income tax, of which it was possible to increase the rates fivefold, and also some very reliable indirect taxes.

With the experience of the last war in mind, we must now turn to examine the position of Great Britain in the spring of 1941.

Economic factors suggest that the most critical moment in the control of consumption in wartime is in the early stages of the expansion of government expenditure, when private incomes are being heavily increased as a result of the building up of the new industrial equipment required for armament production. Later the rate of increase may well be less hot.

If taxation can intervene effectively in this early period, especially before private budgeting has adjusted itself to the new incomes, then the problem of the control of expenditure is well on the way to being solved.

In 1914–16 the adaptation and expansion of British industry for war purposes was slow and long-drawn-out, owing to our great unpreparedness in 1914.

In 1940–41 it has been very much more rapid. The period of rapid acceleration started in the early summer of 1940, and in the spring of 1941 the pace is still quickening. The problem is therefore of much greater urgency and hence of greater difficulty than it was in 1915 and 1916.

It is widely realized and with some dismay that taxation should by now be playing a more effective part in controlling consumption than it is doing at present. It is consequently asserted that successive chancelors have neglected their duty by failing adequately to increase the tax burden. But in the presence of 100 percent E. P. T. a 5-percent tax on total profits where there is no excess, a 42-percent income tax on undistributed profits, coupled with a personal income tax which rises to over 85 percent on the largest incomes, and, in addition, a full schedule of indirect taxes, the charge of undertaxation does not look very plausible. We have, in fact, saddled ourselves with a tax burden the like of which has probably never been seen before. It is undoubtedly very much heavier than that imposed in any other free country at present. Even in Nazi Germany the maximum rate of personal income tax is only 65 percent—a quota we impose on a relatively moderate income of 12,000 pounds—and it is accompanied by an excess-profits tax which, on British standards, is little short of derisory.

It would thus appear that it is not so much the dimensions of the present British tax structure which are at fault, as that the lag in collection is too great. When we have examined the extent of this in the various taxes we shall be in a better position to suggest possible improvements or accelerations. With the time factor in view, it will also be pertinent to consider some proposals which have recently been made for the reform of the income tax.

* * * * * * *

The smallest lag in collection is naturally that of the indirect taxes. The check on consumption is immediate. Income generated in 1940–41 and spent on taxed goods has already mainly reached the exchequer. This is the one good argument for the purchase tax, and in wartime it is a good argument, although in the British case the initial effect, at least, has been lost through anticipation, owing to the unconscionable time consumed in settling the details and establishing the machinery—the natural penalty of attempting to establish a new tax. But the customs and excise formed less than 40 percent of the estimates of tax revenue put forward by Sir Kingsley Wood in the last budget, of July 1940. And since many of the taxed articles are rationed, either directly to the consumer or at an earlier stage of production, demand cannot reach its normal proportions, so that even a high rate of tax can have only a small effect on personal budgeting. Moreover, most of the duties are specific. This means that tax receipts will not rise, with rising prices. Indeed, it is to be feared that they will fall, even in money terms. In real terms the burden of indirect taxes will grow progressively lighter unless the rates are repeatedly raised.

Of the direct taxes, E. P. T. has in theory at least the quickest reaction. It is assessable at the close of the firm's accounting period, and payment is due 1 month from assessment. In contrast to this, the income tax appears quite a slow tax. The slowest part of it is the surtax. Surtax on the incomes generated in 1940–41 will not be payable until January 1943, and as the inland revenue always points out, owing to the difficulty of assessment, collection cannot be considered complete until 6 years have elapsed. By 1947 our need for the control of consumption will probably be considerably less pressing. The amount of income tax which is thus lagged is by no means negligible. In the July estimate surtax represented 8 percent of total receipts from income and profit taxes.

Broadly speaking, income tax (in the narrow sense) has a lag of 1 year in collection, but this general statement conceals several important differences.

Under the new arrangement tax on wage and salary incomes is deducted from earnings as they are paid out. However, this does not eliminate the lag, since liability is assessed on previous and not on current income. For "manual workers" who are assessed half-yearly, the lag is relatively small. Tax on the first half of the financial year 1940–41 (up to October) began to be deducted from the wages of manual workers in January 1941, while other incomes in this category will not begin to pay tax on 1940–41 earnings until November 1941. The first installment of these will reach the exchequer the following month. By the end of the financial year 1941–42 the exchequer will have received five-twelfths of these 1940–41 incomes. Under the old arrangement of half-yearly payment

in January and July, it would have received the full half-year's tax by that time, but the additional lag is a small matter and has to be set against the convenience of more frequent receipt of revenue. It is important, however, that a lag of a year is the usual interval between receipt of income and tax payment in these categories (schedule E), since schedule E is now a very important part of income tax.

In the last normal year (1936–37) it accounted for more than 50 percent of taxable income. With the increase of remuneration, on the one hand, and the effect of E. P. T. in damping down profit incomes, on the other, its importance is considerably enhanced.

The remainder of the incomes generated in 1940–41 will be declared for tax in April 1941, but here again tax will also not begin to flow back into the exchequer until January 1942. Thus income receivers taxed under schedules A, B, and C, or deriving their incomes from the profits of private business, will also enjoy a considerable breathing space before they become taxable.

But these categories are all relatively unimportant. By far the most important part of the tax on schedule D incomes will have left the taxpayers' hands some little time before; rather, it will never have been in their hands at all, having either been deducted "at the source" from dividends and interest, or else have formed part of the profits tax on undistributed profits which is included in British income tax. This section of schedule D is thus capable of exercising a check on expenditure well in advance of any other part of income tax, with the possible exception of the manual workers' section of schedule E. Schedule D is a very important part of the income tax. In the last normal year it accounted for more than 30 percent of taxable income. As the tax on this section is all paid at the standard rate, at least, in the first instance, it is capable of exercising a much stronger check on expenditure than deductions under schedule E, which are made directly at the rate appropriate to each individual and hence usually at substantially less than the standard rate.

The effect of this curious timing of income-tax payments is to cause the tax on, by far, the greater part of the incomes generated in a particular period to reach the exchequer about the same time. Salaries and wages are distributed in advance of the accounts which determine profit incomes; service incomes (professional fees, etc.) are also realized immediately.

Tax is collected on these quick sources of income as soon as practicable but, owing to the standard rate device, it is actually possible to accelerate the collection of the tax on most profit incomes so that it is received in the same financial year as that on the quick categories. This acceleration is not possible in the case of direct-profit incomes from private businesses, which consequently enjoy a greater lag. On the other hand the half yearly assessment of manual workers' earnings enables that part of schedule E to be collected slightly in advance of the rest. A parallel practice is followed in respect of surtax except that, since the business of adjusting the additional quota is a troublesome one, an extra year all around is allowed. In the case of surtax the timing does not appear to depend on technical consideration to the same extent as in income tax. The synchronization may be a matter of policy or convenience.

It would appear that the established indirect taxes cannot be expected to play a greater part in the control of consumption than they are doing at present. The opposition encountered in introducing the purchase tax demonstrates the difficulty of extending their scope and, indeed, there are strong distributional arguments against attempting to do so. The main burden of the task of controlling expenditure must therefore fall on the direct taxes.

It is evident that the Treasury is placing great reliance on the effectiveness of 100 percent E. P. T. for this purpose. If there were a good prospect that E. P. T. would live up to its paper qualifications, this would be quite a plausible policy. The inconvenience of the lag in income-tax collection, and especially in the surtax end of it, would be completely surmounted, since there could be little if any expansion in the upper-income ranges. But it must be remembered that an excess-profits tax can exert no control at the most relevant and vital point—over wage and salary incomes. Especially with high rates of tax, its influence is rather in the opposite direction; and over profit incomes its effectiveness depends on the retention of the 100-percent rate, a policy which is certainly undesirable economically and may become politically difficult. Moreover, it is extremly doubtful if E. P. T. will prove as quick a tax as is hoped. The experience of E. P. D. is very ominous.

The fact that assessment to E. P. T. follows quickly after the declaration of profits does not mean that there may be a considerable lag between the earning of profits and their assessment. In wartime company accounts tend to get considerably delayed and assessments must wait upon them. An important cause of such delay is the difficulty of determining the sums due from various Government departments for war production undertaken. The delay is thus likely to be especially great in the case of those firms whose activities are most expanded and whose tax quota it is consequently most desirable to collect quickly.

Another cause of delay, common to both E. P. D. and E. P. T., is the necessity for the revision of past assessments in every accounting period in order to determine deficiency payments under the suspense accounting principle. This need not, however, impede the discharge of the greater part of current liability. But an additional trouble in the case of E. P. T. is that N. D. C. has always to be assessed as well.

For practical purposes E. P. T. must be considered a new tax. It does not build closely on the experience of E. P. D. The new bits of machinery will require time to settle down before they can be expected to run smoothly. In particular the applicability of the substituted standard to firms which were depressed before the war, and also the liability of interrelated companies, will both require a great deal of care and experiment. E. P. T. aims at being a more precise tax, which implies that its administration is more complicated—a further factor causing delay. A striking instance of this greater complication is the requirement that "average capital employed" must be calculated throughout the period of chargeability with all its ups and downs, instead of as formerly, merely taking the capital actually employed at some one convenient date.

Finally, excess-profits taxes suffer to a greater degree than personal-income taxes from the progressive illiquidity of taxpayers as prices rise. Firms have a greater temptation than individuals to raid their tax quotas in order to maintain existing output. There is no doubt that the enormous arrears of E. P. D. at the end of the last war were mainly due to this cause. In E. P. T. it so happens that the rates allowed for capital are themselves an inducement to firms to use their liquid balances, quite apart from price movements.

Administration difficulties will no doubt be greatest in the early days of the tax. But when these are considered, and also the fact that most of the tax being collected now and for some time to come will only have been assessed at the 60-percent rate current from 1939–40, it becomes very doubtful how much control E. P. T. can exercise in the critical period of expansion. The other difficulties of assessment and collection will tend to increase with the passage of time. The cumulative arrears of E. P. D. are not at all difficult to account for. If there is a danger of E. P. T., thus proving a broken reed, a heavy responsibility for the control of expenditure falls upon income tax, and specially on that part of it which, being assessed at the standard rate, has an exceptionally short lag in collection. It will be useful to examine the mechanism of this method of assessment a little more closely.

* * * * * * *

In addition to raising the standard rate, it would certainly be desirable to consider whether further means of accelerating income-tax payments could not be discovered. Of all the lags, that on surtax is the most considerable. In practice, this is not quite so serious as it looks, since the rate to which the income of a particular year will be liable can be announced after the income has been returned, but before the tax is due for payment. Still, the delay is bad enough. It would introduce some acceleration in the collection of surtax if the practice of lagging "quick" income sources, so as to coincide with the taxation of "slow" sources, were abandoned at least for the duration. There would seem to be no important distributional objections to such a course.

An acceleration of the collection of income tax on wages, salaries, and professional fees would be more effective in controlling consumption. In the straits of the depression we were not chary of resorting to the dodge of exacting tax a quarter in advance of normal practice. There was but a poor economic argument for it then, but there would be a strong one now. Further, while it would be difficult and perhaps administratively impossible to make final assessments for wage and salary deductions on current incomes, it would at least be possible to make a provisional assessment to be collected exceptionally this year, along with the normal quota on last year's income. The additional quota could be set off against future liability. If necessary, a small discount would gild the pill of double deduction. This would be a particularly useful device in the period of rapid expansion, and need only be continued as long as seemed desirable.

It would also be extremely useful in new inducements could be provided for the prompt—or better still the pre—payment of E. P. T. In the last war prepayment of E. P. D. was encouraged by a bonus, but it was too small to be an adequate deterrent to reinvestment. Too large a bonus, on the other hand, would lead to an unnecessary sacrifice of revenue. A way out might be found by an adaptation of the Nazi device of tax certificates. Compulsory investment in war loan would be enforced, the scrip serving for the discharge of future tax liability of the firm. The (low) rate of interest would serve as a small bonus on prepayment.

The certificates should of course be issued only against estimated future tax liability, and not used as a means of attracting funds in general, as they have been in Germany. Collection of E. P. T. might also be speeded up if a preliminary assessment were made actually on the published balance sheet, without waiting for books to be investigated. For the problem of taxpayers' illiquidity another German device might be found useful.

In the last war a portion of the current profits of German firms was blocked on declaration. The amount was sufficient to cover estimated liability at the highest (marginal) rate of excess-profits tax, so that it was considerably greater than true liability. Ample liquid funds for tax payment were thus assured.

With the rates of income tax, surtax, and E. P. T. now in force it would hardly be extravagant to estimate that a third of the additional incomes generated in 1940–41 will sooner or later flow back to the exchequer. If inflation continues the proportion which will do so will tend to rise, it thus appears that the danger of disastrous inflation is very largely due to lags in tax control of consumption and further increases in tax rates will no doubt be necessary. But the more collection can be accelerated the less drastic these will need to be, and the less trouble we shall have in getting back to normal when the war is over.

The CHAIRMAN. Did your committee give any consideration to the imposition of a tax from any and every source derived?

Mr. HART. Yes; that is exactly what we are proposing if I am right in understanding you to feel that the exemptions should be allowed at the source in taxing wages and salaries. We don't recommend allowing exemptions in taxing interest and dividend payments because the incomes into which these payments flow are characteristically large enough to go into the upper surtax brackets, or bound up with salaried incomes on which exemptions would be allowed, or derived from such scattered sources that if exemptions were allowed at their source no tax would be paid.

Taxes of very much the character you ask about are in operation in British Columbia (1931), in Germany (since long before Hitler), in the Dominion of Canada (since 1939), and now in England. A successful tax at the source without exemption at a low rate is levied by the city of Philadelphia. The administrative experience gathered under these taxes, combined with that of our own social-security taxes, should make it a comparatively simple matter to tie in source-collected taxes with our existing income-tax system.

The CHAIRMAN. That gives you a quick tax withheld on all items of income.

Mr. HART. That is exactly what we are advocating, a tax of that character integrated with the income tax to be a basic means of collecting revenue.

The CHAIRMAN. The time the committee has set for recessing has arrived, and you will have to supplement your presentation by either filing a brief or appearing again in the morning, but I cannot say you will have an opportunity tomorrow. We have a very heavy schedule.

Mr. HART. I should like to ask permission to be heard on the special point of prompt collection of income taxes.

The CHAIRMAN. I cannot promise it at this time.

(Mr. Hart submitted additional material for the record, as follows:)

Effect on taxable income of families of lowering exemptions, assuming $90,000,000,000 national income and allowing no earned-income credit [1]

A. FAMILIES TAXABLE UNDER 1940 LAW

[In millions of dollars]

Family income bracket	Aggregate net income	Aggregate exemption (1940 law)		Aggregate amount taxable under—				
		Head-of-family exemption at $2,000	Credit for dependents at $400 per dependent	Exemption $2,000, credit $400	Exemption $1,500, credit $300	Exemption $1,000, credit $200	Exemption $1,500, credit $400 [2]	Exemption $1,000, credit $400
Over $4,200	$16,488	$4,924	$1,989	$9,576	$11,304	$13,030	$10,807	$12,038
B. ADDITIONAL FAMILIES TAXABLE UNDER $1,500 HEAD-OF-FAMILY EXEMPTION								
$3,500 to $4,200	$3,541	$2,721	$1,088	.....	$685	$1,637	$413	$1,093
$3,150 to $3,500	2,446	2,161	804	.....	223	964	22	562
$3,150 to $4,200	5,987	4,882	1,892	.....	908	2,601	435	1,655
All taxable at this exemption: over $3,150	22,475	9,806	3,831	$9,576	12,212	15,631	11,242	13,693
C. ADDITIONAL FAMILIES TAXABLE AT $1,000 HEAD-OF-FAMILY EXEMPTION WITH $400 CREDIT FOR DEPENDENTS								
$2,800 to $3,150	$2,958	$2,942	$1,112	.....	.....	$930	.....	$374
All taxable at this exemption: over $2,800	25,433	12,748	4,993	$9,576	$12,212	16,561	$11,242	14,067
D. ADDITIONAL FAMILIES TAXABLE AT $1,000 HEAD-OF-FAMILY EXEMPTION WITH CREDIT FOR DEPENDENTS REDUCED TO $200 PER DEPENDENT								
$2,450 to $2,800	$3,407	$3,927	$1,453	.....	.....	$717	.....	.....
$2,100 to $2,450	3,672	4,851	1,805	.....	.....	344	.....	.....
$2,100 to $2,800	7,079	8,778	3,258	.....	.....	1,061	.....	.....
All taxable at this exemption: over $2,100	33,512	21,526	8,251	$9,576	$12,212	17,622	$11,242	$14,067

[1] From Iowa State College study of defense financing; derived from statistics of National Resources Planning Board and U. S. Bureau of Internal Revenue.
[2] System now recommended by the Treasury.

Effect on taxable income of single individuals of lowering exemptions, assuming $80,000,000,000 national income and allowing no earned income credit [1]

[In millions of dollars]

A. INDIVIDUALS TAXABLE UNDER 1940 LAW

Individual income bracketed	Aggregate net income	Aggregate exemption under 1940 law (at $800)	Aggregate amount taxable in exemption			
			$800	$750 [2]	$600	$400
Over $1,050	[3] $10,433	[3] $4,599	5,834	6,122	6,984	8,134

B. ADDITIONAL INDIVIDUALS TAXABLE UNDER $600 AND $400 EXEMPTIONS

$700 to $1,050	[3] $1,329	[3] $1,631	0	0	104	512
All taxable at lower exemptions: Over $700	[3] 11,762	[3] 6,233	5,834	6,122	7,088	8,646

[1] From Iowa State College study of defense financing; based on statistics of National Resources Planning Board and U. S. Bureau of Internal Revenue.

[2] System now recommended by the Treasury.

[3] These figures are very unreliable on account of the large size of the income brackets relative to the exemptions in question. But the amount taxable, depending on differences between these figures, is much more reliable. The reason is that exclusion of a large number of individual whose exemption and net income are nearly equal has little effect on the excess of aggregate net income over aggregate exemptions.

Under 1940 exemptions, most of the individuals in the bracket just above $1,050 are taxable, and a few below. Under the $750 exemption, more below $1,050 become taxable. Under the $600 exemption, most of the $700 $1,050 people are taxable, but few of the people below $700. Under the $400 exemption virtually all over $700 are taxable, and many in the $350-$700 bracket; but on the average those in this bracket are not taxable.

[4] Note that brackets represent not net income but a concept of "total income" including deductions, noncash income, and items not reported, which is considerably larger (on the average perhaps one-third larger) than net income.

Taxation of Small Incomes and Collection-at-Source (With Special Emphasis on American Administrative Experience)

By Walter W. Heller, University of Wisconsin

[Note.—This report is based largely on the writer's field investigation of the income-tax administrations of 34 States, the Federal Government, the Dominion of Canada, and 2 Canadian Provinces. The field work was made possible by a fellowship grant from the Social Science Research Council]

Introduction

America's great defense need is revenue now! Correlated with that need is an increasing pressure for curtailment of civilian consumption to permit the maximum war-essential productive effort. The most equitable means of providing the fiscal grease for the wheels of production is a net income tax. It fits the canons of taxation according to ability; it is the least capricious method of controlling consumption. But to meet redoubled emergency demands, taxation as usual is no more realistic than business as usual. The income tax must strike virtually the entire income scale to accomplish its objectives and to ward off more onerous revenue and control measures. Lower-bracket taxation—lower and heavier than the Federal Government has yet been obliged to apply—seems inevitable.

Authorities agree that the question of administration becomes crucial in the downward extension of income taxes. If administration breaks down or becomes so costly as to absorb much of the incremental revenue, the cause is lost. Vital to the problem, then, is the administrative feasibility of taxing small incomes.

What light does previous experience in the taxation of small incomes and in collecting taxes at source throw on the administrative problem? Foreign experience in Britain, in Germany, in almost every European country—is extensive, and much can be gained from it.[1] But more can be gained from experience on our own continent with the same raw materials of taxation that tax programs now under consideration must utilize. And such experience is not lacking. "Grass roots" experiments in lower-bracket taxation have been carried on in a number of our State income-tax laboratories. Even more important, the most reliable administrative weapon thus far developed for taxing small incomes; namely, collection at the source, has been employed by several North American jurisdictions. These domestic experiences and precedents demand attention and evaluation, for they bear directly on the problem at hand.

Accordingly, this report will briefly compare State and Federal income-tax coverage, review State administrative experience in lower-bracket taxation, and examine in more detail the techniques and results of collection at source as practiced in the Dominion of Canada, in British Columbia, in Philadelphia, and, for nonresidents, in New York State.

A COMPARISON OF STATE AND FEDERAL INDIVIDUAL INCOME-TAX COVERAGE

Precedent for downward extension of income taxes, even below the present Federal exemptions, can be found in a number of income-tax States. Reference to table 1 reveals that prior to the 1940 reduction in Federal exemptions, 20 States had lower personal exemptions for married persons, 8 for single persons, and 18 for dependents. In a sense, these States had prepared the way for extension of Federal coverage. Even now, there remain a number of States whose income-tax laws are doing the spadework for reduced Federal exemptions. Thus, exemptions for single persons are still below the Federal in Idaho, $700; Kansas, $750; North Dakota, $500; South Dakota, $600; and Utah, $600. For married persons, ten States provide a lower exemption than the Federal; the lowest is in South Dakota, $1,100; followed closely by Utah, $1,200; then Idaho, Iowa, Kansas, North Dakota, and Oregon, $1,500; Wisconsin, $1,600; Oklahoma, $1,700; and South Carolina, $1,800. Since the Federal credit of $400 for dependents was not changed, 18 States still have smaller credits than the Federal. Clearly, further reductions in Federal exemptions would be no great novelty in those States which have already tapped the very low brackets.

Moreover, exemptions are not the whole preparedness story, for establishment of the filing habit, which may or may not be related to exemptions, depending on the terms of a State's filing requirements, is also an important trail blazer for the lowered exemptions that may follow. Table 1 compares the number of State and Federal 1938 individual returns filed in each income-tax State during 1939. This was prior to the enactment of the lowered Federal limits, but even if these result in an expansion of 50 or 75 percent in Federal filing, the increase will not be great enough to wipe out the numerical superiority of State filing in a number of States. Thus the filing requirements of Delaware, Idaho, Iowa, Kansas, North Dakota, Oregon, South Dakota, Utah, Vermont, and Wisconsin have been sufficiently broad-gaged to elicit at least twice as many State as Federal returns. Oklahoma's figure almost doubles the Federal, and several other States have also had substantial margins in the volume of filing. The application of increases in Federal coverage is obviously facilitated in certain areas by the preexistence of broad State coverage.

STATE ADMINISTRATIVE EXPERIENCE IN TAXING SMALL INCOMES

Several States which have dipped into the lower-income brackets shed valuable light on the administrative feasibility of taxing small incomes. Such States as Delaware, Iowa, Kansas, North Dakota, Oregon, South Dakota, Utah, and Wisconsin have applied taxes to incomes sufficiently far down the income scale to raise most of the problems that must be faced in administering taxes on small incomes. The discussion in this section will highlight those State experiences which are pertinent to the administrative problems involved in broadening the Federal base.

---

[1] For a discussion of German, British, and Australian experiences in taxing small incomes, see Paul J. Strayer, The Taxation of Small Incomes, New York, 1939, ch. 6.

TABLE 1.—*Comparison of Federal and State individual income tax coverage*

State	1940 exemptions in terms of income			Number 1938 returns filed in 1939		
				State		Federal total
	Single	Married	Dependents	Taxable	Total	
(Federal 1940)	$1,000	$2,500	$400			
(Federal 1941)	800	2,000	400			
Alabama	1,500	3,000	300	[1] 20,000	[1] 31,000	39,885
Arizona [2]	1,000	2,000	400	[1] 24,000	[1] 32,000	21,092
Arkansas	1,500	2,500	400	[1] 6,000	[1] 6,700	20,226
California	1,000	2,500	400	342,178	493,728	538,186
Colorado [3]	1,000	2,500	400	44,152	58,026	43,131
Delaware [4]	1,000	2,000	200	17,283	[5] 85,494	17,246
District of Columbia	1,000	2,500	400	76,462	[7] 100,816	114,445
Georgia	1,000	2,500	400	[1] 32,000	[1] 52,000	50,295
Idaho	700	1,500	200	24,842	34,772	13,601
Iowa [3]	1,000	1,500	500	89,620	170,320	77,206
Kansas	750	1,500	200	[1] 70,000	[5] 108,625	53,865
Kentucky	1,000	2,500	400	27,000	[5] 40,000	54,431
Louisiana	1,000	2,500	400	40,000	62,000	60,168
Maryland	1,000	2,000	400	[1] 85,000	[1] [5] 165,000	137,104
Massachusetts [3]	2,000	2,500	250	238,223	420,330	307,403
Minnesota [3]	1,000	2,000	500	84,960	136,950	109,841
Mississippi	1,000	2,500	400	[1] 9,000	[1] [5] 13,000	20,612
Missouri	1,000	2,000	200	[1] 125,000	[1] 150,000	147,150
Montana	1,000	2,000	300	24,717	38,235	28,453
New Hampshire [3]	(200)	(200)		8,800	[1] 18,000	21,563
New Mexico	1,500	2,500	200	[1] 8,000	[5] 11,318	14,118
New York	1,000	2,500	400	681,056	998,050	1,082,965
North Carolina	1,000	2,000	200	[1] 42,000	[1] 70,000	51,324
North Dakota	600	1,500	200	17,058	25,338	11,849
Oklahoma	850	1,700	300	51,235	[5] 91,488	57,599
Oregon [3]	800	1,500	300	85,802	137,395	54,924
South Carolina [3]	1,000	1,800	200	25,850	[5] 39,102	24,567
South Dakota [3]	600	1,100	200	[1] 34,000	[1] 50,000	12,105
Tennessee [3]					21,698	58,788
Utah	600	1,200	300		65,031	19,991
Vermont [3]	1,000	2,000	250	[1] 17,000	[1] 37,500	13,822
Virginia	1,000	2,000	200	47,401	[1] [5] 63,000	73,522
West Virginia	1,000	2,000	300		[1] 75,000	57,710
Wisconsin	800	1,600	400	207,532	535,216	149,884

[1] Indicates estimate made by State income-tax officials.
[2] Exemptions in form of offsets against tax. Income equivalent in lowest tax brackets is given in table.
[3] Has special provisions for taxing income from intangible property.
[4] Has universal-filing requirement.
[5] Tax is only on income from intangible property.
[6] Figure shown is number of 1937 returns filed in 1938.
[7] Figure shown is number of 1939 returns filed in 1940. The 1939 figures are given for the District of Columbia, Maryland, and Mississippi because the exemptions listed for them were not in force during the filing of 1938 returns.

Source: State exemptions: As listed on income-tax-return forms used for 1940 filing on 1939 incomes. Number of State returns filed: Figures furnished by State officials or taken from State tax reports. Number of Federal returns filed: Figures taken from table 1, Treasury Department press release (Aug. 7, 1940) on Statistics of Income for 1938, pt. I.

Delaware

Delaware's experience is unique and significant, because (1) it involves the superimposing of an extremely low-bracket county tax on a State tax which had been in operation for years, and (2) the tax was so set up that various phases and effects of this excursion into the low-income field can be isolated and appraised.

Delaware, then as now, provided exemptions of $2,000 for married persons, $1,000 for single persons, and $200 for dependents. Rates were 1 percent on the first $3,000 of net taxable income, 2 percent on the next $7,000, and 3 percent on all income over $10,000. A return was required of every Delaware resident 21 years of age or over. This universal filing requirement was an important factor in setting the stage for the introduction of the New Castle County tax in 1934. In response to pressing demands for relief funds in that county, the Delaware Legislature enacted a 2-year county tax, applicable to

1934 and 1935 incomes, strictly paralleling the State tax except in exemptions and rates. The county tax was to be administered as part of the State tax. Rates were to be set according to relief needs (but not to exceed the State rates) by the levy court of New Castle County, while exemptions were fixed at $100 for dependents, $1,000 for married persons or heads of families, and nothing for single persons. Fortunately for those who would evaluate the Delaware experience in small-income taxation, the levy court chose for the income year 1934 to impose rates identical to those of the State, thus permitting isolation of the effects of the drastically reduced exemptions.

New Castle County, which includes the city of Wilmington, regularly produces over 95 percent of the Delaware State income-tax revenue, the other two counties contributing less than 5 percent. In other words, although the Delaware low-bracket tax experiment was limited to one of its three counties, that county contains the great bulk of the State tax base. Of the census-estimated Delaware population of 250,000 in 1936, approximately 170,000 resided in New Castle County.

The New Castle County tax on 1934 incomes produced a total revenue of $960,782, while the Delaware State tax at identical rates but higher exemptions produced only $779,898 in New Castle County for the same period.[5] The incremental revenue realized from the lowered exemptions (zero, $1,000, and $100) thus amounted to $180,884, or 23.2 percent more than the amount realized in this county by the State under its exemptions of $1,000, $2,000, and $200. This increase was achieved in spite of the very heavy concentration of Delaware taxable income in the upper brackets, and hence in the hands of relatively few individuals.

Given the same total income, a lowering of exemptions clearly brings far more income into the tax base if the income is concentrated in the low rather than in the high brackets.[6] On 1935 incomes, at rates reduced to one-fourth, one-half, and three-fourths of 1 percent, respectively, on the three income brackets, the New Castle County tax produced $245,463.

The Delaware experience also yields some approximate cost figures. A separate county expense fund was set up to finance the New Castle County tax. Costs were allocated to this fund, apparently on the basis of the increment that could be attributed to the addition of the county tax. The figure thus arrived at was $21,676 for the fiscal year ended October 31, 1935.[7] Expressed as a percentage of the total revenue realized on 1934 incomes under the county income tax, this is a cost of administration of but 2.3 percent. This cannot properly be accepted as the cost of applying the tax to low incomes, however, since less than one-fifth of the total yield came from the decrease in exemptions. But even if the entire cost of the New Castle County tax is allocated solely to the revenue increment realized by the $1,000 reduction in personal exemptions, the percentage cost of collections is shown to be only 12 percent. It is safe to assume that at least $5,000 (and probably much more) of the $21,676 would have been expended for administration of the separate county tax even without any decrease in exemptions below the State levels. It is safe to conclude, therefore, that in spite of the low rates of only 1, 2, and 3 percent, the cost of applying the tax to married persons' incomes between $1,000 and $2,000, and to single persons' incomes between zero and $1,000 was less than 10 percent.

The question of administrative feasibility is not wholly answered by a revenue and cost analysis. Some of the other facts of administration must be examined. What special administrative resources were available? A very important factor in the background of the low-bracket county tax was the existence of almost universal filing prior to its enactment. This assured very substantial filing under the lowered exemptions, although it did not, of course, guarantee proper re-

[5] These and subsequent Delaware figures are taken from the 1936 report of the Delaware tax commissioner.

[6] Thus, $728,823 of the total Delaware income tax of $863,175 on 1935 incomes was paid by 727 individuals with net incomes above $10,000. These 727 persons reported about $28,000,000 of the total $55,500,000 of Delaware taxable income. If the $28,000,000 had been distributed among, say, 20,000 persons with an average income of $1,400, the productivity of the reduction in exemptions would have been greatly increased.

[7] The over-all costs of the Delaware Tax Commissioner's office increased about $37,000 from 1934 to 1935, but since some $15,000 of this increase can reasonably be attributed to other causes—unrelated litigation and assumption of the collection of license and death taxes—the figure of about $22,000 for the New Castle County tax seems reasonable. The 1936 cost of administering the tax on 1935 incomes rose to about $30,000, but is not used for purposes of the comparative analysis here, since the county rates had by then been reduced below the State rates.

porting of income. To complete as far as possible both taxpayer and income coverage, two chief devices were used. The first was a broadened requirement for reporting of incomes at source; information-at-source blanks had to be made out and filed by the payers for all payments of income amounting to $100 or more. Second, a door-to-door canvass of most of New Castle County was conducted during the 2-year life of the county tax. A substantial minimum of compliance was assured by these measures.

Delaware tax officials feel that their experience proved the feasibility of taxing lower-bracket incomes—though not as low as the zero exemption for single persons forced them to go—under the conditions existing in Delaware. As one official put it:

"Our 1934-35 experience with the New Castle County tax proves that there is a tremendous revenue resource down in the lower brackets. But you have to be careful not to go too low. Most of our trouble was with incomes under $500 many of the recipents of which were living on the very relief funds that the tax was supposed to supply. Naturally, there were cases where we couldn't collect at all. And we applied collection by suit only to tax liabilities of $3 or more. Exemptions of $500 for single persons and $1,000 for married persons are rock bottom with present methods of income-tax collection."[6]

There is little question about the success of Delaware's experiment in taxing small incomes. Revenues, costs, and opinions of the administrators who handled the tax all substantiate the position that "it can be done." Delaware Tax Commissioner James P. Truss summarized the experience in these terms:

"We feel that we were able to give New Castle County good administration at minimum cost. We geared our office and field work to get the great bulk of the tax, even in the low brackets, and we limited evasion largely to single individuals with incomes less than $500 or $400. If we had had longer than 2 years of the county tax, we could have assured even better compliance. In view of our Delaware experience, I believe that exemptions of $500 and $1,000, or, surely, exemptions of $600 and $1,200, can be applied if it is considered good fiscal policy to enact them."[7]

Utah

The Utah experience in lower-bracket taxation also demands close examination. Like Delaware, Utah had a universal filing requirement, but, unlike Delaware, Utah felt obliged, because of administrative difficulties, to abandon it in 1935.[8] However, Utah has retained personal exemptions of $600, $1,200, and $300, which amply qualify it for inclusion in this study. In 1940, 68,555 individuals out of Utah's population of 550,000 filed returns on 1939 incomes and paid taxes totaling $742,074.[9] Although Utah's rates are comparatively low, ranging from 1 percent on net taxable incomes under $1,000 to 5 percent on incomes over $5,000, costs of administration as a percentage of collections have been held within reasonable limits. Costs as computed under Utah's sound cost allocation system have averaged approximately 5 percent of collections during the past 4 years.

Within bounds of reasonable administrative costs, Utah tax administrators have successfully applied the income tax to the broad base created by their low exemptions. Universal filing prior to 1936 has been a decided advantage as a prelude to taxing of small incomes, but the intelligent use of all available resources of information by the Utah tax agency has been responsible for the maintenance of good compliance. To achieve proper coverage, both in the filing of returns and in the reporting of income, Utah has employed a large variety of informational sources. Thus, in addition to information returns, Federal income-tax returns, Utah inheritance tax and sales-tax returns, and property-tax rolls, tax agents use unemployment compensation records, lists of physicians and dentists in the office of the State department of registration, motor-vehicle registration files, brokers' customer ledgers, real-estate transfer records, and records of such State agencies as the banking, insurance, and public service

commissions.[10] Each of these sources yields information on potential taxpayers or on certain types or characteristics of incomes. By diligent exploitation of these sources and by a good deal of field work, adequate coverage of both taxpayers and income has been achieved, despite low exemptions.

In applying taxes to the lower-income brackets, tax administrations presumably have more difficulty in gaining compliance among farmers, small businessmen, and professional groups, than among wage earners whose income can be checked at its source. In view of this presumption, the results of two Utah surveys to determine delinquency among farmers and professional groups are particularly interesting:

"In 1938 one man spent 6 months' time in making a check on the income of all the farmers in one county. * * * By securing information concerning payments made to these farmers for their various farm products from elevators, flour mills, feed stores, dairies, canneries, packing houses, wool buyers, and others who buy from farmers, we were able to obtain an accurate indication of each individual's farm income. The result of this check conclusively indicated that the farmers not only filed their returns when a return was due, but that they also included in their returns the small items of income which might easily have been overlooked. The amount of tax assessed as a result of the survey was nil.

"In 1939 a similar check was made of the professional groups, including physicians, dentists, engineers, and attorneys. The entire file of licenses granted by the State department of registration was obtained, and with this file a careful check was made. It was determined that few persons failing in these groups and having any possible tax liability had failed to file a return."[11]

The writer does not wish to suggest that compliance is everywhere as good as indicated by those Utah surveys. In fact, the very experience that prompted the Utah surveys, namely, an Oregon State income tax "delinquency drive," which utilized property rolls, records of buyers of farm products, and other local sources, revealed considerable noncompliance among farmers and small businessmen, and netted a handsome tax yield. And undoubtedly, States which have not been sufficiently progressive in tax administration to undertake such surveys as these and to exploit the available sources of information are not achieving compliance commensurate with that in Utah. What the Utah and Oregon experiences do suggest is that there are methods of administration and sources of information the proper use of which can at least assure adequate coverage of the "difficult" occupational groups, i. e., of farmers, professional men, and small businessmen.

One additional device utilized by Utah in applying its tax to small incomes is worthy of brief mention. On the theory that there are many individuals who are ignorant of filing requirements, or are unwilling, or, in a sense, unable to fill out a complicated income-tax return, but who are willing and able to answer specific questions, the Utah Tax Commission has developed an income-tax questionnaire. "The questionnaire is so drawn as to make possible the determination of the taxpayer's liability for payment of a tax as well as his liability for filing a return. It is accepted in lieu of a return where no tax liability is indicated."[12] These questionnaires are enclosed with the initial return sent to each potential taxpayer, who is thus given the alternative of informing the commission in a simple manner of his income and exemption status. Utah officials are convinced that improved compliance in the lower income brackets has resulted from the use of this simple device.

On the experience of the Utah Tax Commission in taxing small incomes, its chief auditor, W. W. Dansie, comments as follows:

"Our opinion is that Utah's low exemptions are reasonable, both administratively and fiscally. The difficulties of going down to $600 and $1,200 are not at all prohibitive, and the work in our delinquent section combined with the independent checks we make indicates that adequate compliance has been maintained.

"Out here, we have to get into the lower brackets to get revenue, and to make the income tax justifiable from the standpoint of administrative cost. Our larger coverage means a lower cost per return, since the variable cost per return does not increase as fast as the fixed cost per return decreases. We have to go into the lower brackets to justify the cost of collection of our revenues."[13]

Other States

The Delaware and Utah experiences in administering low-bracket income taxes are more informative and instructive than those of any other State. Nevertheless, the experiences of several other States bear on the problem, and should not be ignored.

Wisconsin.—Wisconsin has for a number of years had exemptions in the form of tax credits. In terms of their income equivalents in the lowest rate brackets, these credits amount to exemptions of $800 for single persons, $1,600 for married persons, and $400 for dependents. With rates ranging from 1.6 percent to approximately 12.2 percent (including surtaxes), Wisconsin's individual income tax produced $8,532,000 in the fiscal year 1940;[14] its 1940 population numbers some 3,126,000.

The feasibility of administering income taxes on the rather small incomes reached by the Wisconsin law has never been seriously questioned by its administrators. By judicious use of available information sources, by careful office and field auditing, and by development of an annual filing volume of over 500,000 returns through widespread application of the unusual discretionary power to require returns regardless of the size of net income, very good income and taxpayer coverage has been achieved. In fact, field investigation of State income tax administrations reveals none superior to that of Wisconsin. Hence, its experience is of particular interest.

An estimate of potentially taxable income which is escaping the income tax dragnet has been made for Wisconsin. Over a million Wisconsin returns for the period 1929-36 have been examined and tabulated in the course of an exhaustive statistical survey. For purposes of evaluating the resulting income data, the director of the Wisconsin income study, Frank A. Hanna, has estimated the probable underreporting during the income year 1936. On the basis of experience with the returns, combined with evidence from office and field auditing activities of the Wisconsin income tax agency, he states:

"It would be hard to conclude that those filing returns in 1936 received more than $40,000,000 in addition to the reported $810,000,000 total income."[15]

Thus it appears that despite its comparatively low exemptions, Wisconsin's income tax is probably not missing more than 5 percent of total income. This underreporting is occasioned in part by taxpayer ignorance, in part by failure to remember small items of income, and only in small part by successful deliberate evasion.

Of the feasibility of applying an income tax to lower-bracket incomes, A. E. Wegner, director of the income, inheritance, and gift tax division of the Wisconsin Tax Department, says:

"Administratively, it's quite possible to achieve reasonably full reporting down to income levels of maybe $500 and $1,000. We certainly have had no great difficulty with our present exemptions of $800 and $1,600. But there is the question of cost in the lower-income levels. You can't really process a return thoroughly for less than a dollar or two. So, even though you find the income, it may be too costly to get the tax due on it. If you establish a minimum tax of a dollar or two, you could go down the income scale a long way without getting prohibitive administrative costs."[16]

Iowa and South Dakota.—These two States originally had exemptions (in the form of tax credits) amounting to $600 for individuals and $1,100 for married persons. While South Dakota has retained these exemptions, Iowa has raised its tax credits to the income equivalent of $1,000 and $1,500. Iowa's change was made at least in part for administrative reasons, and constitutes a counter to the experiences of Delaware, Utah, and Wisconsin. South Dakota, while experiencing some difficulty in applying the low-income tax to farmers and small businessmen, has nevertheless found it advisable to retain these low exemptions. An interesting and unique feature formerly operative in the Iowa law and still operative in the South Dakota law is the provision for a deduction of 10 percent of gross income (or a maximum of $100 for a single, $160 for a married, individual) in lieu of all other deductions from income. Tax officials report that between one-half and two-thirds of all South Dakota income taxpayers use this "in lieu" deduction, and that the revenue loss is more than offset by the saving

[14] Bureau of the Census, U. S. Department of Commerce, State Tax Collections: 1940 (State and Local Government Special Study No. 10), March 26, 1941, 20-21.

[16] Statement made to writer during interview in April 1941.

in administrative cost and time through elimination of the necessity of verifying myriad deduction items.

North Dakota.—The North Dakota personal exemption for single individuals, $500, is the lowest in the country, while the exemption for married persons, $1,500, shares the distinction with four other States of being the third lowest. In terms of yield, no State with a general income tax ranks lower then North Dakota, which received but $589,000 from its individual and corporate income taxes combined in the fiscal year 1940.[11] Considerable difficulty has been encountered in applying the low exemptions to farmers, although administrative officials feel that the level of exemptions is, in general, not unreasonable. However, the State itself is a rather barren income field, and since, in addition, its income-tax administration is not adequately financed and staffed, its experience in taxing small incomes cannot be counted as evidence either for or against the administrability of a lower-bracket income tax.

Idaho and Kansas.—Idaho, with exemptions of $700 and $1,500, and Kansas, with $750 and $1,500, both feel that their income taxes are capable of application without undue difficulty except in reference to farm income. Kansas has utilized a widespread publicity and taxpayer education campaign to promote good compliance, and its filing figures (see table 1) indicate that it has attained a very substantial taxpayer coverage. An attempt has been made to encourage farmers to keep better accounts, and, in the face of occasional refusal to institute some type of accounting system upon specific request, farm deductions which could not be substantiated were disallowed. Idaho has given more attention to taxpayer coverage work as compared with auditing than most States. Various local and State records are extensively utilized to increase compliance in the lower brackets.

Oregon.—With exemptions of $800 and $1,500, Oregon also falls into the class of States taxing small incomes. Moreover, it has an intangibles income surtax which brings in many additional returns, a considerable percentage of which report only small amounts of income. Oregon has experienced no disproportionate difficulties in administering its tax and has found (see the discussion of Utah, above) that proper use of available information resources can assure adequate compliance throughout the entire taxable income scale.

General discussion and conclusion

What administrative measures are desirable as part of a program of taxing small incomes? What limits do administrative factors set on the downward extension of income taxes? What conclusions relating to the administrative applicability of lower-bracket income taxes, particularly as a Federal measure, may be drawn from the State experiences just reviewed?

Attaining taxpayer coverage.—The first task of an agency charged with the administration of a tax on small incomes is to build up its "tax clientele." Those who are, or may become, liable for taxes must be either induced or forced to file income-tax returns. Not until the filing habit has been established among those at the lower-income levels can administration achieve real success. For until substantially all potential taxpayers are regularly filing returns, administrative effort will be diverted from the essential tasks of discovering and checking incomes, and of collecting taxes that have been assessed. State experience suggests (1) that techniques for the attainment of an adequate filing volume are available, and (2) that the establishment of a broad base of taxpayer filing is good insurance for the success of low-bracket taxation.

Publicity is a primary technique of stimulating taxpayer filing. Radio talks, press releases, public notices, the conducting of tax forums throughout the State, and administrative assistance to taxpayers during the filing period all contribute to taxpayer readiness to file. Kansas has used this general approach to very good advantage.

Administrative power to request returns either under a universal filing requirement such as that of Delaware or under a discretionary provision like Wisconsin's enables tax agencies to achieve wide coverage. Most States are restricted to requesting returns only of those whom they believe to have a net income above exemptions; in a sense, this places the burden of proof upon the State rather than on the taxpayer and hampers the State in attaining broad coverage among the marginal income recipients, who are sometimes in, sometimes out, of the taxable-income range. It is particularly important to the suc-

[11] Census Bureau, State Tax Collections, 20–21.

cess of a small-incomes tax that steady filing be maintained among this marginal group. To that end, it seems desirable to equip income-tax agencies with broad powers to request returns, either by direct grant of discretionary power—as in Wisconsin—or by low-gross-income filing requirements—as in the Federal law.

Publicity and power to require filing of returns are important administrative weapons. But the administration must know whom to ask for returns. A mailing list can be built up by exploiting the various private and governmental sources referred to by Utah, for example, and by intelligent use of city directories, classified sections of telephone directories, and the like. Even a door-to-door canvass has been found profitable by at least one State—Delaware. And, of course, information returns from income payers (which are required by all income-tax States) are a ready clue to additional taxpayers. The methods of improving filing volume are legion, but one of more special interest in the taxing of small incomes, namely the extensive use of a questionnaire, merits another word. Other administrations might well follow the lead of Utah in using the questionnaire method of eliciting returns from those who are either reluctant or unable to tackle the more formidable tax return itself.

The contribution of a broad base of filing to the success of lower bracket income taxation is attested to by the experiences of Delaware, Utah, and Wisconsin. The previous establishment of the filing habit on a broad, if not universal, base, greatly facilitated the successful application of income taxes to small incomes in these States. And the greatly broadened Federal filing requirements will have a similar preparatory effect. Given proper enforcement, filing requirements based on gross income of $2,000 if married, and $800 if single, extend the filing habit to hundreds of thousands of persons whose net incomes fall below these levels, and who will become taxable only by further decreases in exemptions (or increases in income).

The discovery and verification of income.—Discovering and verifying income is the second task of administration. Widespread filing is, of course, a guaranty of a substantial minimum of income reporting. But to check accuracy of reporting and to insure the inclusion of taxable income, a wide variety of information sources must be utilized. Some indication of their nature can be gained from Utah's experience. Generally, in addition to information returns, the records of other tax agencies, of State regulatory bodies, or local property tax administrations, of local real-estate deed and transfer offices, of stockbrokers, of banks, and of buyers of farm products will yield valuable income data. The lower the exemptions, the more widespread and intensive must be the exploitation of these information sources. The consensus of administrators in the States reviewed is that income can be ascertained—and rather accurately—even in very low brackets, but that certain difficulties arise in the farmer, small business, and professional groups, and that the percentage cost of attaining income coverage mounts rapidly when taxes begin to strike income strata below about $1,300 for married persons and $700 for single persons.

The absence of proper accounting is the chief handicap in the attempt to ascertain incomes of low-income farmers and of business and professional men. A widespread frontal attack on the problem of improving accounting procedures has not yet been made, and there is a real question whether income-tax administrations should be charged with this task. But it may become a necessity in downward extension of income taxes income-tax penalties—either direct or through the disallowance of unsubstantiated deductions—may be the only means of forcing compliance with accounting requirements. In educating the farmer group to keep books properly, the aid of the Department of Agriculture and its far-flung, decentralized services and personnel (e. g., the county agents) might well be enlisted. And, on the assumption that most small businessmen can produce at least a gross-receipts figure, the use of standard ratios of gross to net to determine income in the absence of adequate books might be a real stimulant to improved accounting.

To eliminate in large part the main problem of verification in the bulk of small income returns, namely, the checking of deductions, allowance of something similar to the 10 percent "in lieu" deduction utilized at present only by South Dakota should be seriously considered. It contributes to ease of both administration and compliance, and might be set up on a basis which would contribute to equity. That is, if the percentage deduction were set up so as to diminish with an increase in income, the existence of greater proportionate occupational expenses in the lower-income groups might thus be recognized under the income tax.

Tax collection.—Even with a proper determination of taxable income, there remains the problem of collectibility of the tax. In the very low brackets, this is a real problem, since ability to pay taxes cannot be held in abeyance. Income is spent almost as quickly as it is received, and accumulation of a tax burden for lump-sum payment, however small, may work a hardship. All States taxing in the lower brackets have had to face this dilemma in many instances: The income had been received and verified, but the ability to pay taxes on it had disappeared by the time the tax was due. And where very small amounts are involved, willingness to pay is almost a prerequisite of any tax receipt at all, since the cost of suing for the tax is greater than the tax itself. Both correspondence and field delinquency work so planned as to provide a sufficient density of cases in a given area can, however, stimulate "voluntary" payments at a reasonable cost. To strike at the roots of the problem, it may be necessary to provide means of payment while the income is being received. Collection at source is one method, while another, which may be considered either as an alternative or as a supplement to deduction at source, is the stamp payment plan. Under the latter the taxpayer would on his own initiative purchase stamps in small amounts during the year and pay his tax with accumulated stamps at the time of filing his return.

Costs of administration.—Costs of collecting taxes and processing returns are a primary problem in taxing small incomes. Because of the concentration of incomes in the lower brackets, the number of marginal returns, i. e., those on which little or no tax is realized, increases more than proportionately to a decrease in exemptions. Those costs which depend directly on the number of returns handled thus increase without a commensurate increase in revenue. Three points arise in this connection. First, the marginal cost of handling a return—beyond a volume of reasonable magnitude—is not very great. Second, marginal returns which are relatively or absolutely unprofitable exist at every exemption level; and, while the reduction of exemptions increases the number of marginal returns, it very probably decreases the per-return cost at the margin, while converting formerly marginal and submarginal returns into supramarginal returns. Third, the problem is not really wholly one of exemptions, but one of rates as well. For if the initial rate or filing fee or set minimum tax is high enough, the cost of processing the small-income return can be covered. This is not intended as a suggestion for enactment of a filing fee, since at least two—those of Montana and Utah—fell by the wayside because of the difficulty of administration. But all three points are made with the intention of throwing into relief the problem of the administrative cost of broadening the income-tax base.

General conclusions.—The significance of State experiences in taxing small incomes is briefly this: Given good administration, adequately supported, the income tax can successfully reach into very low income strata. Among the States taxing small incomes, those with high-grade administration uniformly concluded that lower-bracket taxation is feasible at reasonable cost, although beset with difficulties. This conclusion was reached even though none of the States—with the possible exception of Delaware—is a particularly fertile income field to break with the low-bracket tax plow. The industrialized States, a large proportion of whose income recipients are covered under information-at-source provisions, are a much more fertile field; territorial density and information-at-source coverage greatly facilitate the application of a low-bracket income tax.

What lessons capable of Federal application may be gained from the State experiences in taxing small incomes? First, it appears administratively feasible to lower Federal exemptions still further. The lower limits cannot be categorically set, since much will depend on the staff which administers the tax and on the methods of collection and checking employed. But if the States reviewed can or could successfully apply exemptions of $600 and $1,200 or even $500 and $1,000, the Federal Government should be able to dip at least that low. For Federal administration has both jurisdictional and staff superiority over State administrations, and deals with a more fertile field, on the average, than do the States now taxing low-bracket incomes. Second, if the Federal Government goes into lower income strata, it must further decentralize its checking and compliance activities, and must utilize many local and State sources of information. Third, an attack on the problem of accounting procedures of farmer, small business, and professional groups should probably be a part of the low-income tax campaign. Fourth, to reduce costs of collection, to increase the ease of payment, and with it the volume of payments, and to

release administrative funds and energies for application in more difficult sectors of lower-bracket tax administration, the devices of (*a*) collection at the source on all types of income to which it is adapted, and (*b*) prepayment of taxes on other incomes through the purchase of stamps, should be carefully weighed and speedily adopted.

NORTH AMERICAN EXPERIENCE IN COLLECTION AT THE SOURCE[18]

The experience of four North American jurisdictions[19] now applying collection at source to varying portions of their tax bases offer valuable evidence both on the efficacy of this scheme of collecting taxes and on the mechanics of its operation. Each utilizes the device in a manner differing from the others, and each involves a different degree of employer participation in administration. Each therefore contributes to the experiential background of the problem.

Philadelphia's tax probably contributes least, since it is a gross income tax and does not, therefore, involve the crucial problem of adjusting for personal status. New York applies its withholding-at-source provisions only to (apparently) taxable nonresident wage earners in the State, but since these number 75,000, the New York experience is on a sufficient scale to merit close attention. British Columbia's system is outstanding in the length of its operation (since 1931), in the proportion of total individual income tax collected by deduction at source (over one-half), and in the success it has achieved. It was at least partially the forerunner of the Dominion-wide collection-at-source system applied for the first time in 1940. The Dominion system is significant not only because of its wide territorial coverage, but also because of its broad income coverage; whereas the other three systems apply only to wages and salaries, the Dominion system applies to corporate dividends and interest on registered securities as well.

Philadelphia

In December 1939 the Philadelphia City Council passed an ordinance providing for a tax of 1½ percent on gross wage income and net business and professional profits earned in Philadelphia, whether by residents or by nonresidents.[20] It was realized that the tax would be both difficult and costly to collect directly from employees, particularly from nonresidents, and a collection-at-source scheme was therefore adopted. Some of its features are worthy of attention here.

The employer's only obligations are to deduct a flat 1½ percent of the compensation paid all employees at the time of payment, to remit the deducted sums once monthly, and to submit each quarter a list of employees and the amount of tax withheld from each. One or two items are interesting in this connection. The monthly return is a summary form made out in duplicate by the employer and stating only the total number of taxable employees, their net earnings (compensation paid to nonresidents for services outside Philadelphia is not taxable), and the tax withheld. If the employer desires a receipt, he must send the duplicate along with the original and enclose return postage. The quarterly return of tax withheld lists employees' names, Social Security account numbers, addresses, compensation, and, if the employee has entered or left the firm during the quarter, the dates of accession and separation. After the first month, addresses need be reported only for those employees whose addresses have changed and for those who have newly entered the employer's employ.

Employees are required to file returns under certain circumstances. No return is required if "* * * the entire earnings for the year are paid by one and the same employer and the * * * tax has * * * been withheld. * * *."[21] The deputy receiver of income taxes estimated in 1940 that this would exempt approximately three-fourths of all wage earners from the filing of individual returns. Those who are in the employ of more than one employer, or who are employed by nonresident employers, or by the State or Federal Government, or for whom the employer has not deducted the tax at

---

[18] Collection at source is also variously referred to as indirect collection, withholding, stoppage, deduction, or taxation at source.

[19] In addition to the 4 systems discussed here, the Province of Manitoba has a system for deduction of taxes at source on wages.

[20] City of Philadelphia, Income Tax Ordinance, approved December 18, 1939. See also Philadelphia Income Tax Regulations, issued by the receiver of taxes pursuant to terms of the ordinance.

[21] Philadelphia Income Tax Regulations, art. III.

source, must file an annual return by March 15 of the year following the year of receipt of income. The taxpayer may pay the full tax at that time, or in four quarterly installments beginning with the date of filing, or he may elect to pay his tax monthly in advance under a special provision. This provision for current payment of taxes even though not collected at source is of some interest. A form has been provided for applications for permission to pay the city income tax monthly in advance. Upon receipt of this form, the tax agency sends out monthly forms, abbreviated tax returns, which the taxpayer returns with his remittance. At the end of the year, he makes out his regular annual return, but claims credit for the advance payments. Evidently, many employees are using this method of paying their taxes at the time they earn the income.[32] Both employers and employees are fully liable for payment of taxes which are subject to withholding at source.[33]

Some 42,000 employers' accounts representing a million wage earners were already set up by April 1940. Reasonably good compliance, despite unfavorable publicity and considerable opposition to the tax, was apparently being realized. As one tax official put it, "My personal feeling is that we are getting fine cooperation on the part of most employers, and even in those cases where they refuse to withhold the tax, we have recourse to the employee."[34] Administrative problems, are, of course, at a minimum under this system. No adjustment to personal status is necessary, other than wage income (except business profits) is not taxable, and no deductions need be allowed or verified. The main problem is to see that 52 weeks are accounted for in the case of each employee, by either the employer or employee. Other than that, the problem is mainly one of getting employers to comply regularly and of collecting the tax. There is little doubt that collection at source has minimized both evasion and costs of administration and compliance.

New York

The use of the withholding device on the nearly 75,000 eligible nonresident wage earners in the State of New York is a considerably more instructive experience than that of Philadelphia, despite the lesser volume. For the tax involved is a net income tax, and adjustments for personal status, for deductions, and for items of income other than those taxed at source raise added administrative and compliance problems. The system employed for the handling of these problems contains elements that might be desirable in any scheme for application of collection at source to incomes taxable under a net income tax. Substantial duties are imposed on employers in adjusting for the personal status of the employee.

Briefly, the system operates as follows: (1) Employees are required to file with their employers either (*a*) a certificate of residence in New York (Form 101), thus absolving the employer from further duties, or (*b*) a certificate of nonresidence and claim for personal exemption (Form 102). (2) Form 102 is a small card which serves the dual purpose of being the employee's certificate as well as the employer's report to the tax commission of tax withheld at source for that employee. The employer fills out his side of the card, showing the total taxable income, the personal exemption deducted therefrom, the tax withheld after application of the New York rates to the remainder, and the names and addresses of both employee and employer. If the employee is a nonresident, but fails to file Form 102 with the employer, the employer must withhold tax on all payments above the exemption for a single person, viz, $1,000, and fill out his side of Form 102 for submission to the tax agency. (3) On or before February 15, the employer submits to the tax commission (*a*) all the Forms 102, (*b*) the tax withheld, and (*c*) Form 103 summarizing Forms 102 and listing each of the employees for whom a Form 102 is included, together with the amount of tax withheld. (4) The nonresident employee then files a regular income-tax return (Form 203 for nonresidents) listing additional income taxable by New York and allowable deductions from income. From

[32] Tax officials state that letter carriers as a class are making the most use of this privilege.

[33] Thus art. IV–4 of the Income Tax Regulations provides: "Every employer required to deduct and withhold the income tax at the source is liable for the payment of such tax," while section 4 of the Income Tax Ordinance provides, in part, "* * * that the failure or omission by any employer * * * to make such return and/or pay such tax, shall not relieve the employee of responsibility for the payment of such tax."

[34] Statement to writer by Walter Camenisch, deputy receiver of income taxes, during conversation, April 1940.

the computed tax he deducts the tax paid for him at source. If the result is a negative item, his return constitutes an automatic claim for refund.

Several points regarding the mechanics of the system deserve mention. (1) While the employer must make adjustment for the personal status of the employee and compute the tax at the rates provided under New York's graduated scale, thus performing a substantial task, he "* * * is not obliged to verify the nonresident's claim for personal exemption."[15] (2) "The responsibility for payment of the tax required to be withheld at the source is on the employer. However, the failure to withhold does not relieve the employee of the liability for the payment. In other words, where no payment is made either by the withholding agent or by the nonresident employee, we may assess either or both."[16] (3) Although it is assumed that the employer will anticipate the tax payment by withholding an amount each month, the common practice is to deduct the entire amount from the December compensation of the employee. This facilitates adjustment to the employees' personal status, but clearly negates one purpose of the stoppage-at-source system, namely, to liquidate the tax liability regularly as the income is being earned.

As mentioned before, the magnitudes involved in the at-source deduction system are substantial. For the income year 1939, 9,058 employers' summary Forms 103 were filed, together with 73,831 Forms 102 joint employer-employee cards. Approximately $3,350,000 was collected at source. Tax officials estimate that of the 58,654 nonresident income-tax returns (Forms 203) filed, at least 10,000 were filed by employees claiming refunds.[17] No estimates of the amounts refunded are available.

The system is held in high regard by New York administrators, who feel that it greatly simplifies the problem of collecting taxes from nonresidents, and improves compliance very considerably. Relatively few complaints are heard from employers, who are now accustomed to the system, after a number of years of operation. The New York experience deserves close study by those who would set up an administrative scheme for the collection of net income taxes at the source.[18]

British Columbia

The Province of British Columbia has been carrying out a highly significant and successful experiment in taxing wage income at source since 1931. This system differs from that of New York in that the employer is not required to make any adjustment to the personal status of the employee, but merely deducts a flat 1 percent from all wages, salaries, etc. The volume of refunds is thus much greater, and, in a sense, burdens are thus shifted from the employers to the tax administration.

The mechanics of the system involve a number of steps. (1) To initiate the deduction-at-source procedure, an information and instruction sheet is sent the employer, stating that on all earnings of employees amounting to $60 or more monthly, $30 or more semi-monthly, $14 or more weekly, the employer is to deduct and remit monthly a tax of 1 percent of the total compensation paid. His liability for the tax and penalties in case of failure to comply are also stated. (2) The employer files a monthly summary (Form 6) of pay rolls and of the wages subject to tax, and remits with it the amount withheld, but gives no detail concerning the individuals for whom tax is withheld. (3) The office of the commissioner of income tax sets up a folder-ledger card for the employer, recording thereon his monthly payments, the number of employees covered, etc. (4) Each month, using an addressograph machine, the commissioner's office sends out (*a*) a receipt for the previous month's taxes, and (*b*) a form for the reporting of the next month's taxes withheld at source. (5) Annually the employer files a summary (on Form 57) of his monthly wages paid to employees,[19] the amount subject to tax withholding, and the amount withheld. (6) Accompanying Form 57 are individual Forms 57–1 for each em-

[15] Instruction 6, New York Income Tax Form 103, 1940.

[16] Statement in a letter written to the author on April 8, 1941, by Roy H. Palmer, first assistant director, income-tax bureau of the New York State Department of Taxation and Finance.

[17] Data furnished by Roy H. Palmer in letters to author written April 8 and April 16, 1941.

[18] A number of other States also provide for withholding at source for nonresidents, but none approaches New York in magnitude nor working efficiency.

[19] This figure is later checked against the total amount deducted for wages on the employer's business income-tax return.

ployee,[30] listing (*a*) his name and address, (*b*) whether he is married, single, widow, or widower, (*c*) the period employed, (*d*) his total earnings, (*e*) the total 1-percent deductions, and (*f*) the name of the employer. (7) The employee must, if he has additional income, and may, if he has no other income, file an individual income-tax return (Form 7A). He lists thereon his income, deductions, and exemptions; computes the tax; subtracts the tax paid for him at source; pays additional tax if his liability is over $1; and automatically claims a refund if the resulting negative figure is over $1. (8) The individual's Form 57–1 filled out by the employer is matched with his return, and after this verification, refund is allowed in all cases where the amount is over $1.

The magnitudes involved in the British Columbia at-source collection system during 1940 are as follows:[31]

Number of employers' annual returns (Form 57) filed	17,158
Number of employees' annual slips (Form 57–1) filed	324,276
Number of individual tax returns (Form 7A) filed	152,850
Number of refunds paid to employees	141,516
Number of employees receiving refund of full amount withheld	42,488
Total amount of individual income taxes collected	$2,115,537
Amount of tax withheld at source by employers	$2,000,356
Amount refunded to employees	$1,000,576

Relative to the operation and success of the system, which operates in a setting of income-tax exemptions of $600 for single individuals, $1,000 for married persons, and $200 for dependents, the remarks of C. H. Peterson, British Columbia Commissioner of Income Tax, may profitably be quoted at length.[32]

"Although it [the British Columbia collection-at-source system] involves the making of a large number of refunds, it seems the only logical method of collecting taxes from low-income groups. It is much easier to make refunds than to try to collect small amounts at the end of the year. Prior to the adoption of this method we wrote off hundreds, yes thousands, of small amounts every year because it would cost more to enforce collection than the amount of tax involved. Once the system has been brought to a well-established routine, it is not expensive to operate. We have only about seven people wholly and permanently engaged on this particular work, plus an equal number for a temporary period of 3 or 4 months following the filing date for returns. I would note here that no application for refund is necessary; for filing of a return insures a refund if one is due—of course, no return, no refund.

"A very great proportion of our refunds would be eliminated if the employers were required to apply the appropriate exemptions. A large number might also be eliminated if the basic rate of income tax were increased from 1 to 2 percent (the deduction at source still being left at 1 percent).

"It might be interesting to mention that this deduction at source is far from being unpopular with the employee. In fact, once they become accustomed to it, the deduction is not missed and the refund at the end of the year is very popular. We find them very appreciative of getting a few dollars back, and they seem to forget about the larger amount that has been retained as assessed tax. Even those who have an additional tax to pay appreciate the fact that a portion of it, at least, has been taken care of."

It is apparent that the British Columbia scheme has been popular both with its administrators and with those for whom taxes are deducted at source. Although a definite allocation of expenses to income-tax administration is not available for British Columbia, it seems that costs are comparatively low. And unclaimed refunds constitute "a substantial sum of what one might call 'found money.'"[33] This is said by provincial officials to more than pay the cost of administering the collection-at-source system.

---

[30] These forms are made out in quadruplicate, on sheets each containing 9 employee forms. 1 copy goes to the employer, 1 to the employee, and 2 to the tax agency. 2 sheets are perforated, 2 are not. 1 each of the latter goes to the employer and to the tax agency as permanent records. 1 perforated sheet is retained by the employer for distribution of the individual slips to employees, the other is sent to the tax office, where the individual slips are attached to the employees' returns.

[31] Figures furnished by British Columbia Commissioner of Income Tax C. H. Peterson, in a letter to the author written April 8, 1941.

[32] These are excerpts from a letter written to the author by Commissioner Peterson, April 8, 1941.

[33] Ibid.

The system has been an unquestioned success. However, in order to synchronize the provincial scheme with the Dominion system of deduction at source recently initiated, the Dominion exemptions and methods are being adopted. Commissioner Peterson summarizes the changes now in progress as follows:

"Up to the present time no distinctions have been made between married and single persons in the matter of deductions from wages, the deduction being made from everyone receiving wages in excess of the stated amounts. The purpose of this was to save trouble to the employers in applying different exemptions; but of course it increased the work of the Department in making a larger number of refunds. Now that the exemptions have been raised, employers will have to be required to apply the appropriate exemptions. Since the enactment last year of the national-defense tax by the Dominion Government, employers are required to apply the appropriate exemptions for the purpose of that tax, and our increased exemptions are made to conform thereto." [34]

Canada [35]

The Dominion system to which the quotation above refers was put into effect during 1940. It contains many elements which are worthy of note, and adds a number of features not present in the three systems thus far examined. Not only wages but also dividends on corporate stock and interest payments on registered bonds are subject to taxation at source. The tax at source is part of a national-defense tax at rates of 2 and 3 percent, which is applicable to total net income (before deductions of donations and personal exemptions) of all Canadian residents who have an income above $600 if single, or $1,200 if married. The tax is not part of the regular Canadian income tax assessed on net incomes above $750 and $1,500 at steeply graduated rates, but is administered in conjunction therewith.

The steps in administration of the collection-at-source phases of the national-defense tax to wage earners may be summarized briefly. (1) Married employees and employees with dependents file N. D. T. Form 1 in duplicate with their employers.[36] This form establishes the tax status of the employee so far as the employer is concerned. (2) For individuals not filing Form 1, the employer deducts 2 percent of the total annual income, if that income is between $600 and $1,200, and 3 percent if the income exceeds $1,200. For married persons the deduction-at-source is 2 percent of total income, if the income is above $1,200. Adjustments for dependents are made on the basis of a reduction of $8 in the tax at source to be allowed at the rate of 16 cents a week, 34 cents semi-monthly, or 67 cents a month, depending on the pay-roll period. (3) The employer remits the withheld tax once a month to the Receiver General of Canada. Failure to remit the tax subjects the employer to full liability for the tax and a penalty of equal amount. At the time of making first remittance of tax deducted for a given employee, the employer sends one copy of Form 1 to the inspector of income tax for the district in which he resides. (4) The employer accompanies his monthly remittances with N. D. T. Form 2, which summarizes those remittances, but, as under the British Columbia system, he also files summary slips (similar to British Columbia Forms 57–1 described above) for each employee at the end of the year. (5) Employees need not file a tax return with the Dominion tax agency if the at-source-deduction for the national-defense tax applies to their entire income. If it does not, the individual must file a return with the Dominion and pay additional tax, and this is done on the regular Dominion income-tax form. Refunds are made in cases where deductions-at-source have been larger than the individual's tax liability. Such is ordinarily the case only if the individual has been employed for only part of the year.

The deductions at source on account of interest and dividends are made at the rate of 2 percent regardless of the marital status of the taxpayer or the size of the payment. Summaries of the payments and withholdings similar to those for wage earners are submitted annually. Of the Canadian system, Commissioner of Income Tax C. F. Elliott says:

---

[34] Ibid.

[35] An informative summary of the Canadian collection-at-source system is contained in a brochure entitled "National Defense Tax," which is issued by the Income Tax Division of the Canadian Department of Revenue. Revised edition issued January 1941, at Ottawa.

[36] "The employer will rely upon the truth of the information contained in the form unless he has a reasonable suspicion that it is not true, when he will then either request verification from the employee or report his doubts to the inspector of income tax at the time of lodging the form with him so that such report may be fully investigated."—National Defense Tax, 4.

"So far as we are aware, the war legislation imposing the national-defence tax has been well received by the public, and all employers and payers are cooperating fully in complying with its provisions. There is no doubt that the at-source system is an effective method of expediting collection of the revenue."[*]

It is too early to evaluate the Canadian system fully, since it has been in operation less than a year, but it appears that it is achieving the objective of collecting taxes with a minimum of administrative difficulty and with maximum taxpayer ease. It is producing revenue immediately, as needed.

Conclusion

The collection-at-source experiences reviewed plainly establish the feasibility, and in fact the desirability, of applying this system to the collection of income taxes on small incomes. From the elements of the various systems, and upon closer examination of their experience, the United States could unquestionably build a successful collection-at-source system which would, at reasonable cost, produce "revenue now!"

FINANCING DEFENSE

CHAPTER X—SUPPLEMENT: DETAILS OF PROPOSALS FOR PROMPT COLLECTION OF INCOME TAXES

Prepared by A. G. HART, Iowa State College

I. COLLECTION AT THE SOURCE

Collection of taxes on individual incomes at the source is not a totally new idea

The United States income tax was collected at the source in 1913–16. In Great Britain, collection at the source has been optional with the taxpayer for years, and was finally made compulsory at the beginning of 1941. The defense tax on incomes levied by Canada is collected at the source, and so is the regular income tax of the Province of British Columbia. The city of Philadelphia has a tax on earned incomes collected at the source. Many American States tax nonresidents at the source. Some of these systems permit no exemptions, and others collect only once a year; but among them they offer quite a body of experience.[**]

Taxation without exemptions or refunds

As a starting point, we may consider the relatively simple problem of taxing incomes at the source at time of payment without permitting exemptions, and without refunding overpayments of taxes. This type of tax is in use in Philadelphia; and the Philadelphia system may serve as example.

The basic collection procedure of the Philadelphia system is to require employers to withhold tax (1½ percent of compensation paid to employees) and to remit monthly, not later than the 15th of the following month, by mail. The form accompanying the monthly remittance is simplicity itself. Its face reads as follows:

EMPLOYER'S RETURN OF TAX WITHHELD

Form W–1
City of Philadelphia
Receiver of taxes
Under Income Tax Ordinance Approved December 13, 1939

(See back of duplicate copy for instructions)

1. Number of taxable employees		
2. Total salaries, wages, commissions and other commpensation paid	$	
3. Nontaxable items (compensation of nonresidents for services outside Philadelphia)		
4. Taxable earnings of employees	$	
5. 1½ percent city tax withheld		
6. Penalty		
7. Interest		
8. Total (make check or money order payable to "Receiver of Taxes")		

[*] Statement made in letter written to the author, April 17, 1941.

[**] This list of experiences, and much of the interpretation, rest upon information supplied by Mr. Walter Heller, of the University of Wisconsin, who is an expert on taxation of of small incomes.

RECEIPT NO. _____ BANK NO. _____

Enter above employer's name and address.

I hereby certify that the information and statements contained herein and in any schedules or exhibits hereto attached are true and correct.

Owner, partner, member, president, treasurer, etc.

(Date) _____

Pennsylvania unemployment compensation identification No. _____

Enter above your Pa. U.S.I.No. if it does not agree with account number shown below.

For mo. of	year	Account number

Mail to Philadelphia Income Tax Bureau, Tenth Floor, Market Street, National Bank Building, Philadelphia, Pa.

If receipt is required, duplicate copy must also be filed, accompanied by return postage.

In April, July, October, and January, employers are required to send in, attached to the above form, a schedule itemizing the handling of each individual employee's account during the preceding 3 months, and showing:

(*a*) His social security number.
(*b*) His name.
(*c*) His address.
(*d*) Total compensation paid him.
(*e*) Tax actually withheld.

The total tax withheld from all employees must be shown to be equal with the amount remitted for the 3 months.

Individual taxpayers are required to file annual returns unless they have been employed throughout the year by only one employer and had taxes deducted from gross compensation without allowance for expenses. This exception, plainly, is intended to apply to most employees. For residents of Philadelphia who file returns, the basic form is as follows:

Name_____ Street address_____
Post Office_____ State_____ Ward_____
Federal Social Security Account No._____ Occupation_____
1. Net earnings (column 5, schedule B)_____ $_____
2. Less: Salaries, wages, commissions, etc., on which tax has been withheld at source (schedule C)_____ _____
3. Amount subject to tax_____ _____
4. Tax at 1½ percent_____ _____
5. Interest (½ of 1 percent per month)_____ _____
6. Penalty (½ of 1 percent per month)_____ _____
7. Total owing_____ _____
8. Paid with return (make check or money order payable to "Receiver of Taxes")_____ _____

On the reverse of the return, taxpayers are called upon to account for expenses deductible from income, income from salaries, wages and so forth (with deduction of these expenses), and salaries, wages, and so forth, on which tax was withheld.

Under this system, taxpayers who have not had the full amount of tax deducted are called upon to pay the difference. Taxpayers who have overpaid because employers have withheld too much are entitled to refunds from their employers. Taxpayers who have overpaid because they did not get the benefit of deductions for expenses are entitled to credits which may be transferred to other taxpayers or applied to future taxes. Cash refunds from the city are not contemplated.

Individual returns, when required, can plainly be checked against the employer's report of withholding.

Expenses of collection for the Philadelphia system are about $200,000, or 1.2 percent of budgeted revenue of $17,000,000. These expenses cover also taxes on the net profits of all businesses operated in Philadelphia by private individuals or partnerships. The high percentage of revenue spent on administration reflects in part the low rate of 1½ percent; if the rate were raised, costs would rise only slightly. While no figures are available on the total number of employees taxed, Philadelphia is a city of 2,000,000, and the number taxed is certainly not under 500,000. Costs are thus less than 40 cents per employee account.

Collection at source, with exemptions and refunds, on annual basis

Collection of income tax at the source, with allowances for exemptions, is common practice among governments levying income tax on nonresidents. (The Federal Government, for instance, applies this method to nonresident aliens.) A good example of procedure is New York State, which taxes some 85,000 nonresidents.

A nonresident taxpayer is required to file with his employer a certificate, on a card (Form 102), stating his residence, explaining his family status, and claiming appropriate exemptions. This card is passed on by the employer to the tax authorities after the end of the tax year. On the reverse of the card the employer figures he employee's tax bill. The employer's side of the card reads as follows:

To whom paid (employee): _____
Name in full Address
By whom paid (employer): _____
Name in full Address

1. Total paid to this employee while a nonresident during the calendar year _____ $ _____
2. Paid for services within the State while a nonresident _____
3. Amount of personal exemption to which entitled during the period or nonresidence _____
4. Balance—amount on which total tax withheld _____
5. Normal tax withheld (2 percent from first, $1,000; 3 percent from second and third, $1,000; 4 percent from fourth and fifth, $1,000; 5 percent from sixth and seventh, $1,000; six percent from eighth and ninth, $1,000; 7 percent from all over, $9,000) of the amount shown at item 4 _____
6. Emergency tax withheld (1 percent from item 4) _____
7. Total amount withheld (tem 5 plus item 6) _____

Along with his cards for nonresident employees, each employer files a list of employees with amount of tax withheld from each. Where item 3 on the card exceeds item 2, of course, there is no withholding.

The individual taxpayer is required to file a return if his gross income exceeds $5,000 or his net income exceeds $1,000 (if he is single) or $2,500 (if he is married). This return carries all income from sources taxable by New York State, but permits deductions of business expenses and contributions to arrive at "net income." Tax is calculated on the excess of net income over exemptions, at the same rates used on the card. The amount withheld at source is subtracted from the total tax so calculated. If withholdings are

less than total tax, the taxpayer is obliged to remit. If they exceed total tax, the taxpayer's return is treated as a claim for refund.

Current collection at source, with exemptions, deductions, and refunds

To collect taxes currently at the source, with full allowance for taxpayers' claims to exemptions and deductions, is more complex. But it can be done, and is done effectively in various places. The British Columbia system, which has been in force since 1931, will serve for illustration.

Employers in British Columbia are required to make deductions from wages and salaries if the wages of the employee in question exceed:

$60 or more on a monthly pay roll.
$30 or more on a semimonthly pay roll.
$14 or more on a weekly pay roll.

Where deductions are made, they are from the entire amount of earnings. This may push the actual amount paid out in cash to people earning just the minimum a few cents below the amount paid out to people earning just below the minimum. The reason for the arrangement is to make it easier for returns to be computed and checked.

Employers are required to file a monthly "Return of Deductions from Wages." The form of this return is simple:

Employer: _____. File No. _____. Date for filing _____.
See instruction to employers on this form.
This return covers deductions made from wages for the period from_____ _____ to _____.
Total wages, from summary of pay rolls_____ $_____
Add value of free board, lodgings (if any)_____ _____
Total_____ _____
Less wages not subject to deduction_____ _____
Balance, wages from which deductions have been made_____ _____
Amount of 1-percent deductions for which remittance is attached___ _____

Certified a full and correct statement of wages paid, and deductions made therefrom, during the period covered by this return.
Dated:_____, 19___.
(Signature)_____.

Penalty.—For not filing return by due date, one-tenth of 1 percent; not less than $1.

On the reverse, a separate listing of all pay rolls during the period (weekly, semimonthly, or monthly) is made. Details regarding individual employees are not listed on the monthly return.

On an annual basis, employers file a more detailed return. A summary on the first sheet, lists the 12 monthly totals from the forms described above. On sheets which follow, separate listings are given for individual employees. These sheets are made out with three carbon copies. The original and first carbon are for the provincial assessor's office, the second carbon for the employees, the third carbon for the employer's records. The original and second carbon are perforated, so that they can be torn into separate slips for each employee. Each slip reads:

Province of British Columbia, 1940 earnings

Name and address of employee	Married, single, or widowed	Period employed	Total earnings	Total 1-percent deductions	Name of employer

The employer's general list as filed must check with his over-all return. The employee's copy is available to him for making out his personal return. The

original filed with the Assessor, torn into individual slips, is available for matching with individual returns when filed.

Annual returns are also required from "financial agents, brokers, and other persons" for "interest dividends and rents received * * * for clients." These returns list the clients by name and address, and itemize receipts by source, type (interest, dividend, or rent), amount, agent's charges, and balance going to the client.

Corporations, further, are required to report annually the total amount of "cash dividends, stock dividends, and shareholders' bonuses" paid during the year to each shareholder receiving as much as $100, giving the shareholder's name and address. Thus most income payments are reported to the provincial assessor at the source; though current collection applies only to wages and salaries.

Personal income-tax returns, on an annual basis, are required from all executors and trustees under a general rule in the Income Tax Act that "every person, in whatever capacity acting, who is in receipt of any income of or belonging to any other person shall furnish * * * a return." Returns from individuals on their own account are made on forms of two types (like our 1040 and 1040A). The simple form (I. T. Form 7A) is for "individuals whose principal income is derived from salaries or wages"; the other (I. T. Form 7B) provides space for analyzing business expenses and determining taxable income.

Form 7A is designed to fit into the source-collection system. The essential points on its face are as follows:

Name: _____ Occupation: _____
Residential address: _____
Return of income for the year ended Dec. 31, 1940.
Salaries, wages, commissions, bonuses, or gratuities (give name and address of employer) _____ $_____
Perquisites (free board, living accommodation, etc.) received from _____ _____
Other income (give full particulars in each case; attach separate schedule if necessary) _____ $_____
Deduct exemptions and expenses (if any) _____ _____
_____ _____
_____
Less personal exemptions (from p. 2) _____ _____
_____
Balance, net taxable income _____ _____
_____
Tax thereon as per table of rates on p. 2 _____ _____
Subtract the amount of 1-percent deductions from wages during 1940 (particulars of earnings and 1-percent deductions may be obtained from employers, who have been provided with forms for this purpose) _____ _____
_____
Balance:
Additional tax payable _____ _____
Refund due _____ _____

Additional tax is payable in quarterly installments, the first with the return (which must be filed by February 28). If refunds are due because deductions have exceeded tax liability, the return described above "will be accepted as application therefor."

The British Columbia tax rates apply to all income in excess of personal exemptions. "Exemptions" in British Columbia include life-insurance premiums up to $300, contributions up to 5 percent of income, and contributions of employees to retirement funds, besides what corresponds to the American "personal exemption and credit for dependents"—$1,000 for a head of family, plus $200 per dependent, or $600 for a single person. (These levels are being increased in 1941 to match Dominion regulations.)

Calculation of taxes is made by the taxpayer from a very simple table on the back of Form 7A:

RATES OF TAXATION

On the net taxable income.—One percent on the first $1,000 or any portion thereof, or $10 on $1,000 and 2 percent on the remainder where the income does

not exceed $2,000; $30 on $2,000 and 3 percent on the remainder where the income does not exceed $3,000; and so on, the rate rising by 1 percent with each $1,000 addition to income up to $1,530 on $17,000 and 18 percent on the remainder where the income does not exceed $18,000; $1,710 on $18,000 and 19 percent on the remainder where the income does not exceed $19,000. Where the net income exceeds $19,000 the rate is 10 percent on all the net income.

Over and above these rates, surtaxes have been charged on incomes which exceed exemptions by more than $5,000; but these are being repealed to avoid interfering with Dominion revenues.

According to a letter to Mr. Heller, dated April 7, 1931, 324,000 employees were covered by employers' slips filed for 1940 out of a population in British Columbia of about 750,000. Of the employees a large proportion were, of course, nontaxable. About 153,000 individual income-tax returns on Form 7A were filed; 142,000 taxpayers received refunds and 10,000 showed additional taxes or refunds due of less than $1, on which no action was taken. Thus there were only about 1,000 employees owing additional tax; 48,000 of the refunds (chiefly to married persons) were for the full amount of tax withheld at source; the other 94,000 for part of the tax. About 48 percent of the $2,000,000 withheld by employers was refunded by the Province to taxpayers. It is believed that a large number of taxpayers entitled to small refunds failed to file returns.

The reason for the large number of refunds is the crude method of handling exemptions. A single individual who earns $13 a week for 50 weeks (an annual total of $650) is not taxable at the source. If he files an annual return, his income will exceed exemptions by $50; and under the rule which excuses taxpayers owing less than $1, he is nontaxable, so that no return need be filed. But an individual who earns $15 a week for 50 weeks (an annual total of $750) has deducted at the source 15 cents each week (an annual total of $7.50). On his annual return, his income in excess of exemptions will be at most $150, so that he is entitled to a refund of $6—more if he has paid life-insurance premiums, made contributions, etc. If he is married, he is entitled to a refund in full. In fact, a married man with 2 children must average over $28 a week if he is not to receive a refund in full, and over $73 a week if he is to have additional tax to pay. These figures assume 50 weeks' work; if work is irregular, the corresponding weekly rates are higher.

The actual inconvenience resulting from this system is surprisingly little. The Commissioner's letter to Mr. Heller states that the full-time staff working on these taxes numbers only 7 people; and as many more are employed temporarily for about 4 months a year. In short, about 10 man-years of work handles accounts of 324,000 taxed employees and takes care of 141,000 refunds. British Columbia has about one one-hundred and seventy-fifth the population of the United States. On a comparable scale, therefore, we should need about 2,000 persons (principally clerical help) to administer such a system—waiving possible short cuts through incorporating its administration with existing income taxes or social-security taxes or both.

If amounts of tax withheld were larger, inconvenience to employees through having funds tied up might be considerable. The Canadian defense tax requires employers to apply a more accurate (though still crude) exemption system, differentiating between single and married persons, and British Columbia is following suit.

Current collection at source with current allowance for exemptions

The systems we have examined so far fail to allow for exemptions except retroactively. But it is entirely possible to collect taxes on wage and salary incomes at the source on a basis giving taxpayers immediate benefit of exemptions.

Such a pattern of collection has long been in use in Germany, where a number of different items are deducted from wages. Employees file with employers cards stating the employee's family status—much as nonresident employees do in New York State. Employers are provided with tables applying to daily, weekly, and monthly pay rolls, telling them how much to deduct from each size of payment for each family status. For example, a man earning 40 marks weekly (as of 1934) had deducted RM 1.00 if single. If married, he had deducted RM 1.00 if childless, RM 0.80 if he had one child, RM 0.45 if he had two children; nothing if he had more than two. If widowed, he had deducted RM 1.00 if he had one child, RM 0.60 if he had two, nothing if he had more. (Besides all this, there were deductions for social insurance, etc., which did not depend on family status.) Such a system imposes a good deal of clerical work on employers. Its advantage is

fairness among employees and the avoidance of refunds. Besides giving immediate benefit of exemptions, it can be used to apply any desired number of different rate levels at different income levels. As German experience shows, it can be integrated with the regular income-tax system.

Another type of system is represented (though in reverse) by our social security system. Employees' contributions to social-security funds are deducted at the source by employers. But deductions are not based on the whole of incomes, since the excess of incomes over $3,000 per annum is not affected. If this system were turned upside down and deductions made from the excess of income over a certain amount—as is done on a noncurrent basis in New York State—exemptions would be crudely provided for.

Another entirely practicable method would be to calculate tax on income without exemptions and then exempt individuals from a certain amount of tax—as is done on an annual basis by many American States. This might involve simpler arithmetical operations for employers than calculating tax on an excess of income above exemptions. It is not in the least different in principle.

Keynes plan variants

Proposals for "deferred pay" or "forced loans" advanced by J. M. Keynes and others involve having a percentage of income withheld at the source and handed over to the Government by employers, just like the tax schemes we have just examined. The difference in the Keynes proposal is that part of the amount withheld—a larger proportion in low-income groups, a smaller proportion higher up the pyramid—should be regarded as a loan to the Government, to be repaid after peace returns.

Adoption of a scheme of this sort might somewhat simplify the exemption problem, since account could be taken of family status in deciding what proportion of each individual's payments was eventually to be returned. But having $3 a week, say, withheld for repayment years later would be much more of a burden to a married man earning $30 a week than to a single man earning the same amount. Possibly it would be tolerable to make no distinction according to number of children when deducting at the source; but a distinction would have to be made, in fairness, between persons with and without dependents.

Handling exemptions by coupons

Another way to give current benefit of exemptions would be to issue to employees books of exemption coupons. These coupons should be issued in different denominations, each representing tax upon the amount of income upon which some type of taxpayer was entitled to exemption. Single-person coupons, say, might be green, married-with-no-dependents red, married-with-one-dependent yellow, etc.

Responsibility for determining the type of coupons to be issued would fall entirely upon the agency set up to issue them. Each coupon should carry its owner's social security number, and should be negotiable only through the owner's employer. Employers should be instructed to send in the coupons as part payment to the Bureau of Internal Revenue of tax withheld.

With each pay roll, employers would have to classify employees into two groups: those whose coupons had a face value exceeding the amount which was to be deducted, and those whose coupons had a face value equal to or less than the deduction. For the first group, pay checks would be issued as though there were no source-deduction. The amount of coupons received from such employees would then be totaled. For the second group, the tax rate would be deducted from the amount payable, and the face value of the coupon added in. In drawing up his report, the employer would show deductions from the second group at the stated percentage of employees' pay checks, deductions for the first group at the face value of their coupons. (That is, on his books it would appear that he had deducted from the first group's checks not only the official tax rate, but also the excess of the face value of coupons over the tax deduction proper.) Against the total deduction shown for both groups combined, he could apply his coupons at face value when sending in his remittance.

This system has one loophole. The coupons held by persons whose exemption exceeded their incomes would be worth to them less than face value. Persons with larger incomes could afford to offer them payment in cash if they would exchange coupons. Insofar as large earners got undeservedly high exemptions in this way, there would be a leakage of potential revenue. The benefit would be divided between the low earner who sold his exemption and the large earner who bought it.

This difficulty would have to be faced. It has been suggested above that it should be handled by trying to prevent transfer of coupons. Use of Social Security numbers for identification, negotiating coupons only through employers, and (perhaps) filing of coupon books with employers would be fairly effective safeguards. At the other extreme, transfer might be permitted and care taken to see that the original holder got face value for his coupon either from the employer or from some other employee. If this were to be done, however, it would be more straightforward simply to send employees weekly or monthly checks for the amount of tax chargeable on their exempt income, and have employers deduct taxes with no exemptions whatsoever. On this basis exemption would have to be pushed extremely low if there were to be any net revenue; so that it is clear nontransferability would have to be enforced.

IMMEDIATE REFUNDS THROUGH BANKS

Still a further possibility would be to provide immediate benefit of exemptions through the banking system. Employers could be required to deduct taxes without benefit of exemption, giving the employee a receipt along with his pay check. The employee should then be permitted to clip together his receipt and his exemption coupon and pass them both across a bank counter. The banker would give credit for the face value of the receipt or the exemption coupon, whichever was smaller, and on presenting both (still clipped together) would be reimbursed by the Government. The banker would be obliged to confirm the matching of the social-security number on receipt and coupon.

For persons who kept bank accounts, transactions of this sort could readily be handled by mail. In fact, the procedure could be short-circuited by letting the depositor file his exemption-coupon book with his banker and instruct his employer to mail his tax receipt to the banker, which would involve very little work in handling and would greatly simplify the banker's task of matching numbers on tax receipts and coupons.

On this basis the major problems would be to assign exemption levels correctly and to guard against forgery of tax receipts where the authentic receipts are smaller than the exemption coupons.

Setting exemptions to reduce the refund problem

No system of weekly, semimonthly and monthly exemptions for employees can be devised which will prorate annual exemptions so evenly as to avoid both refunds and excess amounts of tax payable. The reason for this is that different employees work for different parts of the year.

If it is desired to minimize the number of employees owing additional tax at the end of the year, an exact proration of the annual exemption will do this. Nobody is paid on a weekly basis more than 52 times a year, so that on this basis nobody will have received the benefit of more than his total annual exemption. This is approximately the system in British Columbia. The minimum $14 weekly at which tax starts corresponds to an annual total of roughly $700—$630 of exemption plus an additional $100 on account of the rule that taxpayers owing less than $1 need not remit. As we have seen, virtually no additional taxes are collected from employees there.

This situation—where refunds are common but claims for additional tax are rare—has the advantage of giving full collections. Small claims for additional tax are hard to collect; a few hundred such claims burden the administrators more than thousands of refunds.

At the other extreme, absolutely to eliminate refund claims requires letting taxpayers apply exemptions against their incomes till the entire exemption is exhausted. This has the serious drawback of bunching tax collections at the end of the year; and if taxes are substantial the taxpayer is likely to miss the benefit of installment payment.

If it is desired to hold refunds below the maximum in number and amount, it is desirable to prorate exemptions so that persons continuously employed will enjoy more than their exemption, at least during most of the year. There are two basic possibilities.

(1) Make the total of weekly or monthly exemptions exceed the annual total (making each week one-fortieth, say).

(2) Allow every taxpayer to claim a limited number of oversized weekly or monthly exemptions (say 40 on a weekly basis), spreading them through the year in any way he sees fit so long as he does not claim more than one in any one week.

Either of these systems could be applied through exemption coupon books. On one basis, the total face value of coupons would exceed the annual exemption. On the other the total face value of coupons would equal the annual exemption, but there would be less coupons than there are weeks or months.

Adjusting exemptions if rates change during the year

It is likely that in the next few years tax-rate changes will have to be frequent, and rates may well change several times a year. It would be relatively easy to notify employers of new effective rates. On the side of exemptions, if employers handle them, it will be necessary to issue new deduction tables. If they are handled by a coupon system, the value of coupons not yet due can be changed by decree. If it is desired to push exemption limits down when raising tax rates, coupon values can be left unadjusted or changed less than in proportion to tax rates.

Taxing property income at the source

Taxation of interest and dividends at the source is a very simple matter relative to taxation of wages and salaries since no exemptions need be allowed at the source. The reason is that almost all interest and dividend payments go to persons who also have salaries and will have their exemptions taken care of there; while a good proportion of the residue goes to persons who have incomes in the surtax brackets. Persons with small property incomes and no salaries commonly depend largely upon annuities, and can be provided for by exempting annuities in whole or in part.

A further slice of property income (including a good share of rent income) can be taxed currently by requiring trustees and other agents to deduct tax from items passed on to clients, as is done in British Columbia. Clients who are prepared to certify that they are not getting the benefit of exemptions in connection with salaries should be given the privilege of having their exemptions cared for by trustees, much as wage-earners' exemptions are handled.

II. CURRENT TAXATION OF INCOMES NOT TAXABLE AT THE SOURCE

The arrangements described above are calculated to reach wages, salaries, interest, dividends, and such part of rents as may pass through the hands of agents or trustees. But they cannot reach the incomes of farmers, professional men, shopkeepers, and other self-employed persons, rent incomes not passing through agents, etc. If small employers are exempted from collecting tax on their employees, moreover, some salary incomes may escape.

Furthermore, the arrangements described are adapted to collection of normal tax (or elements of surtax applying uniformly to all taxpayers), not of progressive surtaxes. Surtaxes could be worked into the system; but the complications would be enormous.

Extension of existing system of returns

The mechanism for reaching these important elements of tax liability must almost necessarily be an extension of our present system of collecting income taxes through annual returns. The chief types of extension to be considered are:

(1) Making returns more frequent (say quarterly).

(2) Approximating tax liability from the previous year's return.

(3) Encouraging prompt payment in advance of final determination of liability by discount, etc.

Frequent returns

It is not impossible to draw up quarterly income-tax returns on a basis similar to that of present annual returns from many taxpayers not reached at the source. This would apply to professional men, brokers, shopkeepers, etc. The chief exception is the farmer—if his income springs from annual crops, there are several quarters of the year for which his income can simply not be estimated.

A quarterly return, both to spare the tax collectors needless work and to avoid injustices among taxpayers with different seasonal income patterns, should be regarded as merely provisional. It should be in abbreviated form, and should

be open to correction by the taxpayer at the time of his next quarterly return or of his annual return.

The chief use of quarterly returns is as an option open to individuals who would be handicapped by the system of presumptions described below.

Taxation by presumption

In the defense period the rule among taxpayers will be to have higher rather than lower money incomes in successive years. Accordingly, the tax liability of most taxpayers can be approximated by assuming their income to be the same as last year. Quarterly current payment could thus be obtained by requiring payment each quarter of one-fourth of the tax which would be due at the current year's rates in case income was as shown on last year's tax return.

With the number of tax returns increasing, this would catch the overwhelming bulk of the tax liability, though it might leave a numerous fringe of new taxpayers not required to pay quarterly. Individual taxpayers who find this system overestimating their tax liability should have the option of substituting a rough estimate of income based on current data, as suggested above.

Taxpayers—particularly farmers with annual crops—whose income receipts are highly seasonal should be permitted to postpone quarterly settlements coming before the date when the bulk of their receipts comes in. This might be taken care of by blanket provisions for certain types of farmers and special applications for nonfarmers in comparable positions.

Encouraging prompt payment

The Treasury has already made public the outline of a scheme for encouraging prompt payment of taxes on a voluntary basis. This could be much strengthened through offering discounts to persons who pay promptly—particularly if these discounts were available only to taxpayers whose prompt payments cleared the bulk of their tax liability.

A workable system would be to offer a special class of nontransferable security which would apply against tax liability with interest. To make the inducement strong, interest should be allowed only if (say) 20 percent of total liability had been covered by March 31, 40 percent by June 30, 60 percent by September 30, and 80 percent before the end of the year. If the taxpayer has overpaid, the excess of his securities should be redeemed in cash, with interest at a rate enough below the standard rate to prevent reaping windfalls by such overpayment.

In case tax rates were changed during the year, the amount of prepayment required in each quarter to qualify for interest should be determined by the tax rates ruling within that quarter.

This system would be a substitute for the presumptive-tax system (with its optional variant of quarterly returns) described above. It would work both for incomes of the self-employed and for surtax liability of persons taxed at the source.

III. ANNUAL EQUALIZATION

It is a principle of fair taxation that persons in the same family status and with the same incomes should have the same tax bills. But all the techniques described above are aimed not to measure tax liability precisely but only to approximate it. Consequently, annual returns must be used to equalize burdens.

Limiting use of annual returns

To keep the number of annual returns within manageable limits, it is necessary to avoid requiring them of the whole population. For this purpose the present device of requiring returns only from persons with certain gross incomes and/or certain net incomes must be continued. It will be necessary, however, to require returns also from persons paying taxes on a quarterly basis. In practice, this amounts only to requiring returns from persons who filed taxable returns last year—a rule which now exists informally.

By setting the limits of gross and net incomes in proper relation to exemptions, the number of nontaxable returns can be kept within reasonable bounds. As regards persons taxed at the source, the object should be to have a large group of taxpayers who are slightly undertaxed and need not be called upon to pay in the difference. This can be done by fixing weekly exemptions so high as to total rather more than annual exemptions, and waiving returns from incomes only slightly above annual exemption limits.

Option to file for persons overtaxed

Some persons taxed at the source are sure to have deductions from their incomes, claims to exemptions which they could not prove in time to get the benefit currently, etc., etc. Accordingly, some taxpayers will find that they have overpaid unless current exemptions are fixed extremely high relative to annual exemptions.

Such taxpayers should be permitted to file returns as applications for refund of amounts overpaid. Regulations should be set up and funds provided for prompt refunds (without requiring data not given in the return) under the following conditions:

(1) The individual in question was taxed at the source.

(2) Either:

(*a*) His gross income was less than, say, $3,000 and his refund claim was greater than $1; or

(*b*) His gross income exceeded $3,000 and his refund claim was between a lower limit of $1 and an upper limit of $10 or 10 percent of tax (whichever is less).

More substantial claims should be refunded only after fuller inquiry.

Uniform treatment of prompt payments

It was indicated above that a potent weapon for securing prompt payment of taxes by persons not taxed at the source is to credit interest on prompt payments down to the date of final settlement. If this system of inducements is adopted, interest should also be credited on sums collected by withholding at the source, and at the same rate. For convenience in calculation, interest should be either at 3 percent (i. e., one-fourth of 1 percent monthly), or 6 percent (one-half of 1 percent monthly).

If rates of tax change during the tax year, the rate charged on annual returns should be the average of the rates applying in the 12 months of the year. This would mean equal treatment of incomes of equal size, regardless whether they were received in an even flow over the year or were bunched at certain dates. If we experience a sharp rate of price increase, this may mean discriminating in favor of persons receiving the bulk of their income early in the year (when dollars are worth more goods); but we must hope to keep prices within bounds.

IV. THE PERIOD OF TRANSITION

As soon as we start collecting income taxes currently, each taxpayer must start applying part of his current income to taxes upon that income. But whenever we start, taxpayers will still have some taxes to pay on previous incomes under present regulations. Until this accumulated tax liability is worked off, current income must support both current and back taxes. Obviously this creates a problem.

Low rates during transition

If the revenue and price situations do not require double revenue during the period of transition, the taxpayer should be helped either by a reduction of his liability for back taxes or by low rates on the current period. The former is possible if the transition begins at the start of a calendar year. In collecting taxes in 1942, for instance, it would be possible simply to reduce normal rates on 1941 incomes to zero, levying corresponding rates on 1942 income collectible in 1942. But if collection starts within a calendar year, the fact that some taxpayers settle in full while others now pay in quarterly installments makes this procedure unfair. To cut rates on 1940 incomes in order to permit taxation of 1941 incomes during the last half of 1941 would mean discriminating against those who paid their 1940 taxes in full on March 15, 1941. Accordingly, rates on 1941 incomes should be made low. This would also simplify the problems of 1942, when collections of taxes on 1942 incomes and of the unpaid residue of tax on 1941 incomes would run concurrently.

Maintenance of surtax during transition

The above argument for temporary abatement of rates applies to "normal" tax and to the part of the proposed new surtax schedule which strikes all taxable incomes. But the progressive part of the surtax should not be excused, since this would grant a windfall amounting to a substantial part of income to taxpayers liable for surtax. They expect at present to pay surtax on each year's income in future, and to remit surtax for 1 year is not required by fairness.

If surtax is not to be remitted, it may be desirable to permit transition to a current collection basis to be spread over more than 1 year for taxpayers in the

upper brackets who apply for the privilege. Pressure for current payment (through quarterly payments based on previous returns, or through discount schemes) need not extend beyond the uniform part of the surtax. The monetary effect of permitting late payment of the rest of the surtax is bound to be mild—firstly, because the amount of taxes involved is not likely to exceed $500,000,000 or $600,000,000; secondly, because taxpayers in these brackets are more likely than those in lower brackets to adjust this year's spending to taxes payable next year.

DEPARTMENT OF FINANCE,
THE GOVERNMENT OF THE PROVINCE OF BRITISH COLUMBIA.

WALTER W. HELLER, Esq., *April 7, 1941.*
% University of Wisconsin, Madison, Wis.

SIR: I am in receipt of your letter of the 2d instant, and return herewith the credential enclosed. I am also sending you a copy of the Income Tax Act, taxation act, a short synopsis of the tax legislation for ready reference, forms covering the operation of the 1-percent wage deduction, with accompanying explanation, and the forms in use for general income-tax purposes; also a booklet giving full particulars of the new Dominion national-defense tax.

Referring first to the synopsis, the changes indicated in item 1 (income) are proposed changes recently announced; but not yet enacted. The changed exemptions will conform with those applicable to the Dominion national-defense tax, and the surtax is being repealed in order to give the Dominion a freer hand in this field of taxation for national and war purposes.

Item 1 is, of course, covered by the Income Tax Act.

Item 2 (a), (b), (f), (g), and (h), as well as item 3, will be found in the taxation act. (2 (c), (d), and (e) are covered by section 32 of the Income tax Act.

Items 4, 5, 6, and succession duties are each separate statutes and I imagine of no concern to you in your present study.

Answering your questions in numerical order:

(1) The tax has been deducted from wages at source since 1931.

(2) Although it involves the making of a large number of refunds, it seems the only logical method of collecting taxes from low-income groups. It is much easier to make refunds than to try to collect small amounts at the end of the year. Prior to the adoption of this method, we wrote off hundreds, yes, thousands, of small amounts every year because it would cost more to enforce collection than the amount of tax involved. Once the system has been brought to a well-established routine, it is not expensive to operate. We have only about seven people wholly and permanently engaged on this particular work, plus an equal number for a temporary period of 3 or 4 months following the filing date for returns. I would note here that no application for refund is necessary, the filing of a return insures a refund if one is due—of course, no return, no refund.

(3) This is partially answered above. A very great proportion of our refunds would be eliminated if the employers were required to apply the appropriate exemptions. A large number might also be eliminated if the basic rate of income tax were increased from 1 to 2 percent (the deduction at source still being left at 1 percent).

(4) (*a*) No; compliance by employers is good.

(*b*) Some difficulty has been experienced with employers who have only a couple of employees. We overcome this to a large extent by permitting quarterly returns to be made in such cases. We are not strict with these small employers in the application of penalties, as we feel they have to be given some credit for doing a lot of work for us for nothing. Penalties are only applied where evasion is flagrant.

(5) The forms requested are enclosed. We do not issue any report.

(6) I will number these questions in the order asked:

	1940
(*a*) Number of employers' returns filed (Form 57)	17,158
(*b*) Number of employees' slips filed (Form 57–1)	321,276
(*c*) Number of Form 7a income-tax returns filed by individuals	152,850
(*d*) Number of persons receiving a refund of the full amount deducted	48,488
(*e*) Number paying added tax (approximately)	10,000
(*f*) Total individual and corporation income-tax collections	$10,236,183.33
(*g*) Total individual and corporation income-tax collections	$2,115,537.20
(*h*) Amount paid by employers at source	$2,066,356.00
(*i*) Amount refunded to employees	$1,000,575.81
(*j*) Number of refunds	141,516.00

I am also enclosing, from our classifications, statements showing the source from which our total tax is received and the income groups under the head of "Employment," which may be of interest for your purpose.

In connection with the figures given above, under 6 (*d*), the figure of 48,488 is also included in the figure of 141,516 under 6 (*j*), and is composed largely of married persons in the two low-income groups. Practically this whole number of refunds would be eliminated if employers were required to apply the exemptions; also a very large number of partial refunds would be thus eliminated.

It might be interesting to mention to you that this deduction at source is far from being unpopular with the employee; in fact, once they become accustomed to it, the deduction is not missed, and the refund at the end of the year is very popular. We find them very appreciative of getting a few dollars back, and they seem to forget about the larger amount that has been retained as assessed tax. Even those who have an additional tax to pay appreciate the fact that a portion of it, at least, has been taken care of.

In further explanation of 6 (*b*) and (*c*), the difference between these two figures represents the number of persons from whom sundry small deductions have been made, but who have not bothered to file returns to obtain a refund. This represents, in the aggregate, a substantial sum of what one might call "found money."

I think this covers pretty well the information you wanted; but if I can be of further assistance to you I will be glad to hear from you.

For your information in this connection, the population of this Province is approximately 750,000.

Yours respectfully,

———— ————,
Commissioner of Income Tax.

DEPARTMENT OF FINANCE,
THE GOVERNMENT OF THE PROVINCE OF BRITISH COLUMBIA,
April 7, 1941.

Re tax deductions at source from wages.

Attached are forms in use in connection with the deduction at source from wages:

(1) *"Information for Employers."*

(2) *Form I. T. 6.*—This is a monthly return made by employers covering deductions made during the preceding month. You will note that no details are given concerning the individuals from whom deductions were made. This information being given on the annual return—Form 57.

(3) *Folder-Ledger Card.*

(4) *Form I. T. 57 and 57-1.*—This is the employer's annual return of wages paid to employees. The total on Form 57 must agree with the aggregate of monthly returns. You will note that all wages are required to be shown whether deductions have been made from them or not—that is, they may have been below the exemption level. This is for the reason that the total wages shown here must agree with the wage deduction claimed on the income tax return.

Forms 57-1 are in quadruplicate, two for the department, one for the employee, and one for the employer. The reason for the two copies for departmental use is that the perforated one is attached to the individual employee's return and the copy that is not perforated is for subsequent ready reference.

As you will see, we use an addressograph machine and the forms are put through this machine before being sent out to the taxpayer, so that when they are subsequently received the filing is simplified. The folder-ledger card is also made from this addressograph plate.

Form I. T. 6 is sent out monthly, along with the receipt for the previous month's payment, window-envelopes being used.

Up to the present time no distinctions have been made between married and single persons in the matter of deductions from wages, the deduction being made from everyone receiving wages in excess of the stated amounts. The purpose of this was to save trouble to the employers in applying different exemptions; but of course it increased the work of the Department in making a larger number of refunds. Now that the exemptions have been raised (as indicated by the synopsis enclosed) employers will have to be required to apply the appropriate exemptions. Since the enactment last year by the Dominion Government of the national-defense

tax, employers are required to apply the appropriate exemptions for the purpose of that tax, and our increased exemptions are made to conform thereto. I am enclosing a booklet giving full information respecting this Dominion national defense tax, which I think you will find of interest and service.

———— ————,
Commissioner of Income Tax.

COMMISSIONER OF INCOME TAX, DEPARTMENT OF FINANCE,
Victoria, B. C.

INFORMATION FOR EMPLOYERS

INCOME TAX ACT—1 PERCENT WAGE DEDUCTIONS

Subject to the limitations set out hereunder, every employer is required to deduct 1 per cent. from the wages of every employee at the time the wages are paid, and to remit the amount so retained to the Provincial Collector for the district on or before the fifteenth day of the following month. The prescribed form (I. T. 6) must be completed and forwarded with the remittance. It is the practice to mail this form monthly to every employer of whom the Department has a record, but this is for convenience only, and the non-receipt of the form does not relieve the employer from the liability of making a return.

These deductions are only to be made if the earnings of the employee amount to—

$60.00 or more on a monthly pay roll.
$30.00 or more on a semimonthly pay roll.*
$14.00 or more on a weekly pay roll.

(NOTE.—Only wages *below* these amounts are exempt. In all other cases the 1-per cent. deduction must be made from the full amount of the wages.)

The liability to deduction is not determined by the rate of pay, but by the total amount payable to the employee during any one of the pay-roll periods.

The term "wages" has a broad interpretation and includes and includes any compensation for labor or services measured by the time, piece, or otherwise. This covers commissions, bonuses, etc, as well as ordinary wages or salary. It also includes any incidental perquisites or privileges, such as free board or lodging, and these must be valued by the employer at prevailing rates and be added to the earnings.

Records.—Every employer must keep accurate records relating to all his employees, which will show their names and addresses, whether married or single, rate of wages, time worked, wages paid, and the amount (if any) deducted from each. At the end of the year a complete list of employees will be required from all employers, showing the total wages and deductions for the year in each case.

Liability of Employer (Sec. 23 (3)).—Every employer who deducts and retains any amount from the wages of an employee under the provisions of this section shall be deemed to hold the same in trust for His Majesty and for the payment over of the same in the manner and at the time provided under this section; and the amount shall until paid form a lien and charge on the entire assets of the employer's estate in the hands of any trustee having priority over all other claims of any person.

Penalty (Sec. 53 (1)).—Every person who, in contravention of any provision of this Act, fails to make any return required by section 23 in the manner and within the time prescribed therefor shall forfeit and pay to the Minister an amount of money equal to one-tenth of one per centum of the total wages paid by that person during the period to be covered by the return; but the amount so forfeited in any case shall not be less than one dollar or more than fifty dollars.

C. B. PETERSON,
Commissioner of Income Tax.

*Although section 23 (5) of Income Tax Act states the exemption as $50 per month, section 24 (2) provides that no tax be assessed for less than $11, which in reality makes the exemption $100 more, or approximately $60 monthly. Note that under section 23 (4) no refunds of less than $1 are made. P.

I.T. Form 6.

DO NOT DETACH.
This copy will be receipted and returned.

Employer's Return of Deductions from Wages pursuant to the provisions of the "INCOME TAX ACT."

To be filed with the Provincial Collector, — NOT LATER THAN Apr. 15th 1941

Certified a full and correct statement of wages paid, and deductions made therefrom, during the period covered by this Return.

Dated ..... 193....

(Signature) .....

PENALTY.—For not filing Return by due date 1/10 of 1%, not less than $1.

INSTRUCTIONS TO EMPLOYERS.

Employers are required to deduct 1 per cent. from the wages of every employee, earned after March 31st, 1934, if the total earnings of the employee amount to:—

$60.00 or more on a monthly pay-roll.
$30.00 or more on a semi-monthly pay-roll.
$14.00 or more on a weekly pay-roll.

NOTE.—Only wages *below* these amounts are exempt. In all other cases the 1 per cent. deduction must be made from the full amount of the wages.

The "Summary of Pay-rolls" forming part of this Return must be completed in every case before the Return is filed. The total amount of wages paid to employees, from whom no deductions have been made by reason of the exemptions stated above, must be entered in the column provided for that purpose.

Monthly returns from employers are filed in these folders, which also serve as the ledger account.

INSTRUCTIONS TO EMPLOYERS.

Form 57-1, to be attached hereto, must contain a complete list of all employees, showing wages paid and deductions made, and must be completed in accordance with the following instructions:—

Particulars respecting each employee must be shown on a separate slip.

Fees and salaries paid to directors and officers of corporations must be included.

Column 1.—Show in alphabetical order full name and residential address of employees, surname first.

Column 2.—State whether employee is married, single, widow, or widower.

Column 3.—Where possible, give particulars, such as: 12 mos; 6 mos. to Oct.; casual, etc.

Column 4.—Show total wages or other remuneration for the year 1940, including the value of all perquisites, such as free board or living accommodation.

Column 5.—Show in one amount the total deducted from employee's wages for the calendar year.

Column 6.—Name of employer must appear on every slip. A rubber stamp is suggested for this purpose.

The employee's copy of each slip should be handed to the employee, as the information thereon is essential for the preparation of his individual return.

Extra copies of Form 57-1 may be obtained from any Provincial Assessor. (The information respecting employees will not be accepted on any other form.)

PENALTIES.

For failure to file this Return in the manner and within the time specified: One-tenth of 1 per cent. of the total wages paid (minimum, $1; maximum, $50).

For false Return: Upon summary conviction, a fine not exceeding $1,000.

PAYMENT OF TAX.

(1.) Every person liable to pay any tax under the Act shall send with the Return of the income on which the tax is payable a payment of not less than one-quarter of the amount of the tax, and he shall pay the balance (if any) of the tax in not more than three quarterly instalments thereafter, together with interest at the rate of four and one-half per centum per annum upon each instalment from the last day prescribed for making the Return to the time payment is made.

(2.) Every person liable to pay any tax who fails to pay in full any payment or instalment thereof at the time prescribed by subsection (1) for the payment of the same shall pay, in addition to the interest payable under that subsection, interest at the rate of four per centum per annum on the amount in default from the date of default to the date of payment.

RATES OF TAXATION.

On the Net Taxable Income:—
1% on the first $1,500 or any portion thereof, or
$ 10.00 on $ 1,500 and 2% on the remainder where the income does not exceed $ 2,000;
$ 20.00 on $ 2,000 and 3% on the remainder where the income does not exceed $ 3,000;
$ 50.00 on $ 3,000 and 4% on the remainder where the income does not exceed $ 4,000;
$ 100.00 on $ 4,000 and 5% on the remainder where the income does not exceed $ 5,000;
$ 150.00 on $ 5,000 and 6% on the remainder where the income does not exceed $ 6,000;
$ 210.00 on $ 6,000 and 7% on the remainder where the income does not exceed $ 7,000;
$ 280.00 on $ 7,000 and 8% on the remainder where the income does not exceed $ 8,000;
$ 360.00 on $ 8,000 and 9% on the remainder where the income does not exceed $ 9,000;
$ 450.00 on $ 9,000 and 10% on the remainder where the income does not exceed $10,000;
$ 550.00 on $10,000 and 11% on the remainder where the income does not exceed $11,000;
$ 660.00 on $11,000 and 12% on the remainder where the income does not exceed $12,000;
$ 780.00 on $12,000 and 13% on the remainder where the income does not exceed $13,000;
$ 910.00 on $13,000 and 14% on the remainder where the income does not exceed $14,000;
$1,050.00 on $14,000 and 15% on the remainder where the income does not exceed $15,000;
$1,200.00 on $15,000 and 16% on the remainder where the income does not exceed $16,000;
$1,360.00 on $16,000 and 17% on the remainder where the income does not exceed $17,000;
$1,530.00 on $17,000 and 18% on the remainder where the income does not exceed $18,000;
$1,710.00 on $18,000 and 19% on the remainder where the income does not exceed $19,000.
Where the net income exceeds $19,000 the rate is 20% on all the net income.

SURTAX ON INCOME OVER $5,000.

In the case of individuals whose net income, as ascertained by sec. 22 of the "Income Tax Act," exceeds the sum of $5,000, a surtax is imposed in addition to the tax indicated herein, in respect of which a notice of assessment will subsequently be mailed to the taxpayer fixing the date upon which the additional surtax is payable.

Remittance in favour of the Provincial Collector for the sum of $..... is enclosed herewith, being the total amount or not less than one-quarter of the amount of tax on the income for the period covered by this Return, estimated as follows:—

EXTRACTS FROM THE "INCOME TAX ACT."

On or before the last day of February in each year, every person, in whatever capacity acting, who is in receipt of any income of or belonging to any other person shall furnish to the Commissioner a Return with respect thereto.

Every trustee shall retain, from time to time, out of any moneys or credits which come to him in his representative capacity, so much as is sufficient to pay the amount of all taxes accrued due or in arrears and payable under this Act in respect of the person or estate represented by him; and he is hereby indemnified for all amounts so retained and paid over to the Commissioner pursuant to this Act.

Every trustee, before distributing any moneys or assets under his control in his representative capacity, shall obtain a certificate from the Commissioner certifying that no unpaid assessment of income tax properly chargeable against the person or estate represented by him remains outstanding; and if the agent or trustee distributes the money or assets without obtaining the certificate he shall, in addition to all other penalties to which he may be liable, be personally liable for the payment of the income tax so remaining unpaid, but otherwise he shall not be liable personally for the income tax.

(Whereupon, at 5:45 p. m., the committee adjourned until 10 a. m., Thursday, August 14, 1941.)

REVENUE ACT OF 1941

THURSDAY, AUGUST 14, 1941

UNITED STATES SENATE,
COMMITTEE ON FINANCE,
Washington, D. C.

The committee met, pursuant to adjournment, at 10 a. m., in room 312, Senate Office Building, Senator Walter F. George (chairman) presiding.

The CHAIRMAN. The committee will come to order. The first witness is Mr. J. B. Stewart.

STATEMENT OF J. B. STEWART, CLINTON, IOWA, SECRETARY-TREASURER, OUTDOOR ADVERTISING ASSOCIATION OF AMERICA, INC.

Mr. STEWART. Mr. Chairman, and gentlemen of the Senate Finance Committee, I am J. B. Stewart, of Clinton, Iowa, representing the Outdoor Advertising Association of America, of which I am secretary and treasurer. I am also an operator in the outdoor-advertising business in Clinton, Iowa, where I have operated for some 40 years, so I probably know something about the business that I am to speak on.

The CHAIRMAN. Mr. Stewart, I see quite a number of witnesses here listed on this same general subject matter. Is it possible for you to combine your statements so that the committee may make as much progress as possible?

Mr. STEWART. Mr. Chairman, as far as the outdoor advertising industry is concerned, I will be the only speaker. I prepared a brief statement and argument on it. It has been placed in the hands of each member of the committee, and I would like to present that.

Mr. Abernathy, whose name appears right below mine, and who was to follow me, has given his time to me. Also, the American Highway Sign Association, who are the small-sign people, have asked me to speak for them as well.

The CHAIRMAN. Mr. Stewart, we would be glad to hear from any of the taxpayers. Of course, we find it necessary to shorten the hearings as much as we possibly can.

Mr. STEWART. I appreciate that, Mr. Chairman.

The CHAIRMAN. You may proceed.

Mr. STEWART. First, I might say, our association and our industry is more than grateful to the Senate Finance Committee for giving us this opportunity to present our views on this subject, because it is the first opportunity that we have had at any time to express our views before a congressional committee on it. As you probably know, when the outdoor-advertising tax was introduced into the revenue bill, it

was placed there at the last hour of the last day, and we had no hearing and no opportunity to be heard. We believe if the gag rule had not been imposed over there, and we had an opportunity to present the facts which I want to lay before you, that the bill would not have come over in that shape for your consideration. With that brief statement, I would like to state my point.

The Outdoor Advertising Association of America, whose members operate 90 percent of all standard outdoor-advertising facilities in the United States, protests against the enactment of section 3269, part XI, of H. R. 5417, for the following reasons:

1. A tax upon advertising, or any single medium of advertising, is mistaken in principle, because, instead of taxing industry's profits, it taxes the machinery which produces the profits.

2. It proposes to tax only outdoor advertising maintained by concerns engaged in the business, thereby exempting 80 percent of the total number of outdoor-advertising signs and structures from taxation, and accomplishing ultimate destruction of the business of outdoor advertising.

3. It would result in confiscation of all the net income or profits of small operators and take at least 30 percent of the present profits of the entire industry, in addition to all the other taxes which we now pay.

4. The proposed tax would reduce income-tax collections by an amount far greater than any new revenue it could possibly yield.

5. By crippling the facilities of those engaged in the outdoor advertising business, it would lessen their ability to serve the Government in the present emergency, as they have consistently done in the past emergencies.

6. It would create an unfair competitive advantage in favor of other untaxed advertising media.

7. The proposed tax would not produce sufficient revenue to justify its adoption.

On behalf of the organized outdoor-advertising industry, we offer for the consideration of your committee the following objections to the enactment of those sections of H. R. 5417, which levy a discriminatory tax upon outdoor advertising, radio, and electric signs:

It is unthinkable that the outdoor-advertising industry which has, in the past 50 years, contributed millions of dollars' worth of space to the Government should be crippled through discriminatory taxation. During the World War the members of the organized industry rendered such outstanding service, by displaying, without charge for labor, materials, and space, Nation-wide showings of posters for all the Government activities, that on July 9, 1919, President Woodrow Wilson wrote:

> The members of the association lent invaluable aid to the Liberty Loan, fuel, food, Red Cross, and other campaigns, by constantly reminding patriotic Americans of their duties to their country during the war. The value of such a service cannot be overestimated.

Similar letters of commendation were received from Secretaries of the Treasury McAdoo and Glass, United States Food Administrator Herbert Hoover, United States Fuel Administrator Harry A. Garfield, the heads of the American Red Cross, the United War Work Fund-Raising Campaign, and many others.

From the information of the committee, we submit a copy of the War Souvenir Edition of the Poster, published in 1919, which contains the record of the organized outdoor advertising industry during the World War, with facsimile reproductions of the letters from President Wilson and other Government officials, above cited, as well as reproductions of many of the posters used during that period.

In the present emergency, the members of the outdoor-advertising industry have already shown their willingness to lend their aid by contributing space, labor, and materials for the display of Army enlistment 24-sheet posters and those of the United Service Organizations for national defense.

Certainly, to cripple or make ineffective, through unwise and discriminatory taxation, a fundamental means of disseminating information to the public, such as outdoor advertising, through which a message may be delivered simultaneously in over 16,000 markets, cities, and towns in every State in the Union, would be detrimental to the national-defense program and the national morale and welfare.

The organized outdoor-advertising industry, represented by the Outdoor Advertising Association of America, has an invested capital of approximately $100,000,000. Its annual sales total from $40,000,000 to $45,000,000. Its combined net profit amounts to from $3,500,000 to $4,000,000. On this basis, the proposed tax is exorbitant and, as applied to a majority of those engaged in the industry, would be confiscatory.

Of the 1,200 taxable operators, over 1,000 have a relatively small volume of net income per unit operated, and as applied to them the tax would amount to from 50 percent to more than 100 percent of the profit realized annually.

The measure of the tax does not take into account the differences in unit revenue as between structures of the same size placed in relatively more or less advantageous locations. An advertising structure in a big market would pay the same tax as a similar unit in a small town. Similarly, one located, for example, in a recreational resort and productive for a limited season in each year, would pay as much as a structure having advertising value the year round. Examples of such inequalities could be multiplied.

It is worthy of mention that there are approximately 200,000 lessors of locations who derive revenue from rents paid by persons engaged in the outdoor-advertising business. Many of such lessors are farmers. These lessors would ultimately participate in the losses of the members of the industry who might be compelled to abandon locations which this tax would render unprofitable.

The outdoor-advertising industry has no intention of resisting its fair share of taxation, but asks for equality of treatment, and holds that a revenue bill should have no other purpose than to raise revenue. The idea of regulation or undue restriction has no proper place in a tax measure and an occupational tax is not a proper excise tax.

We believe that advertising plants, whether radio, newspaper, or magazine buildings and equipment, or outdoor-advertising structures, are legitimately subject to a normal personal-property tax by the States; and the members of this association already pay such taxes, as well as income tax and all other taxes which are uniformly levied

upon this and other businesses. But a tax levied upon the column inches appearing in a publication, the number of square feet of surface of an outdoor-advertising structure, the time sales of radio stations, or the sales price of neon tube and electric signs, is clearly a tax upon advertising itself, and is mistaken in principle.

Advertising is a mass salesman and a tax placed upon it tends to discourage its use and is, to say the least, inexpedient and absolutely unsound in economics. Such a tax would be similar to a tax on the tools of a workman or the services of a salesman.

The value of any tax from the standpoint of revenue is doubtful if it tends to discourage production.

To tax any medium of advertising, or to tax all advertising, would retard the process of distribution and thereby discourage production, thus lowering the national income, which is the proper source of taxes.

A tax on advertising, unless it is to be levied on all sales agencies, including salesmen themselves, cannot be equitable, as advertising operates to reduce other costs of distribution out of all proportion to its own cost. To tax advertising would be to offer an incentive to the backward manufacturer to cling to less efficient and more costly methods of selling and put a premium on inefficiency, to the detriment of the ultimate consumer.

Each medium has its own particular place in the advertising business and there is no justice in singling out one or more media for taxation, thereby leading to an unfair competitive advantage in favor of other media.

Any tax law should produce revenue and should have no other function. Furthermore, it should produce enough revenue to justify its adoption. In the revenue bill as it passed the House, the tax proposed on outdoor advertising is to be applied only to persons who display outdoor advertising matter for another person. In other words, it is an occupational tax on those in the outdoor-advertising business and would leave untaxed at least 80 percent of all outdoor advertising, because it levies no tax whatever upon outdoor advertising placed or maintained by those who are not in the outdoor-advertising business.

Under this provision, a manufacturer, merchant, or anyone else can maintain his own outdoor signs and pay no tax on them, but if he contracts with an outdoor-advertising company for identical signs, the outdoor-advertising operator must pay a tax on every one of them and naturally the cost of the sign is increased to the extent of the tax, thereby placing him at a marked disadvantage.

Senator BAILEY. That would be just as if we should tax advertising agencies but not the advertising that is given out by individuals.

Mr. STEWART. Exactly.

Senator BAILEY. And that we should tax advertisers, not by the value of the advertising, but by the square yard of advertising space.

Mr. STEWART. The point here is, Senator, that 95 percent of the small signs—what we call small signs—which the members of the Outdoor Advertising Association do not operate, but the members of the small-sign associations do—the manufacturers or someone else who wants to can go out and put up their individual signs, and, therefore, 95 percent of the total number would go untaxed entirely.

Senator BAILEY. What would the newspapers say if we took such a shot at their advertising and taxed them by the page?

Mr. STEWART. Well, I maintain that if outdoor advertising is to be taxed by the square foot, naturally the newspapers should be taxed by the column inch.

Senator BARKLEY. It is a fact that they all charge by the space they use; is it not?

Mr. STEWART. What is that?

Senator BARKLEY. Whether it is a newspaper or advertising billboard, they charge for their services according to the space they use?

Mr. STEWART. Exactly.

Senator BARKLEY. So the theory of the tax is that it is according to the space used.

Mr. STEWART. The space you use.

Senator BARKLEY. Theoretically, the more space you use, the more valuable the advertising is.

Senator TAFT. However, the New York Times charges more per inch than the Podunk Herald.

Mr. STEWART. If a fellow got $3,000 a year for an advertisement in the big city he would pay the same tax as the fellow getting $25 a year for the same advertisement in the small city.

Senator BARKLEY. In all probability the New York Times reaches more people than the Podunk Herald. The advertising rates are based on circulation, are they not, of the newspaper?

Mr. STEWART. No question about that, just as outdoor advertising is.

Senator VANDENBERG. Speaking frankly, the theory of the tax was to get billboards out of the way entirely; was it not?

Mr. STEWART. I am afraid so, Senator Vandenberg. That is why I am making the point that outdoor advertising has no place in the revenue measure, that an occupational tax is not properly an excise tax.

Senator BARKLEY. What interest has the Treasury in taxing billboards on the highways?

Mr. STEWART. As far as I am informed, the Treasury has no interest whatever in this particular section of the revenue bill and does not feel it would produce sufficient revenue to justify its adoption. In fact, that is borne out, I think, by what Senator Brown said the other day as to the additional money that was raised in the collection of the income tax when you lower the exemption. According to the papers Sunday morning, he made the statement here Saturday that lowering the exemptions produced $19,000,000 additional revenue and it cost $15,000,000 to collect it. If it costs $15 out of every $19 to collect an additional income tax where the machinery was all set up for collection, how much would it cost per dollar of revenue to collect a tax like this, where entirely new machinery would have to be set up, where you would go out and measure hundreds of thousands of signs, or at least, set up some kind of way to get the money in, after you levy the tax?

My own opinion is the cost of the administration of the measure would be more than the gross revenue.

Senator BARKLEY. Senator Brown is not here but I doubt whether he was quoted correctly, as it is claimed he stated, that by lowering the exemptions, it cost $15 out of every $19.

Mr. STEWART. Here is what he is quoted as saying, Senator, in the New York Times, Sunday, August 10. He says:

> When the exemptions were cut from $2,500 to $2,000 for married persons and from $1,000 to $800 for single individuals, the new group of lower taxpayers provided only $19,000,000 in revenue. Furthermore, he said it cost $15,000,000 to collect that revenue.

That is where I got my authority.

Senator BARKLEY. I do not know whether he said it or not. The mere fact that he is quoted as having said it is not prima facie evidence of having said it.

Mr. STEWART. That is very true. I agree with you there. I merely tell you what was my authority for making that statement.

Senator TAFT. May I ask one more question?

A good many of these taxes are on the theory that you could pass them on to the consumer. Could you do that in your industry?

Mr. STEWART. I think that is entirely impossible, Senator Taft, for this reason: Most contracts are made over a considerable period of time and, naturally you could not pass on the tax for any contracts that are in effect. Furthermore, in the organized outdoor advertising industry the association, its members, publish their rates for the succeeding year on July 1 of the preceding year and on July 1 of this year the 1942 rates were published and are in the hands of every advertising agency that places outdoor advertising. Quotations are made on those published figures. Certainly, they could not raise them that year. It is better, in my opinion, to levy a tax on the revenue that would be produced by the use of that money in advertising, which is many times the initial amount, than to dry it up at the source.

Senator TAFT. Could you pass it on while the newspapers are not taxed?

Mr. STEWART. Certainly not. If we did, it would certainly create an unfair competitive advantage for all other media, because the smart advertiser would naturally want to get $1 worth of advertising for every dollar he placed. Certainly, it would be no secret to him that out of every dollar he placed in outdoor advertising, a certain proportion of that must go to a tax, whereas, he could spend his whole dollar in the newspaper or direct mail, or magazine, or various other forms of advertising without being subject to that tax.

If we pass it on to the advertiser, you destroy our medium just as effectively as if we absorb it ourselves.

Senator VANDENBERG. I do not see why any argument is necessary to prove that this is completely discriminatory, unfair, unprofitable, and indefensible. I would like to save a day's time by taking it out of the bill now.

Mr. STEWART. I would be very glad to stop if you did that, gentlemen.

Senator LA FOLLETTE. You will settle for that; will you not?

Mr. STEWART. I will settle for that, Senator La Follette.

The CHAIRMAN. You are proceeding at your own risk now. You may convince Senator Vandenberg that he is wrong.

Mr. STEWART. I am not afraid of that. Do you advise me to quit, Senator?

The CHAIRMAN. I am simply making the suggestion to you.

Mr. STEWART. I do want to bring this one point out. Any tax that discriminates between persons or things in the same classification has never been tolerated in this country and to tax 20 percent of outdoor advertising and leave 80 percent untaxed because the 20 percent is maintained by one set of people and the 80 percent by another set, is obvious discrimination and cannot be defended as a proper revenue measure.

I will not take the time. I see you gentlemen are a little impatient, and I believe you have those points before you. I have a figure here as to our estimate on what the possible gross revenue would be. We place it at $1,191,000.

The CHAIRMAN. Would it not be the tendency of the user of the board to put up his own boards?

Mr. STEWART. That is what we think, and therefore, our revenue would be reduced because they would keep coming down. Here is the point that the American Highway Sign Association handed me this morning that I do not have in my brief, but it represents their view. These gentlemen have a lot of service companies that put up little bits of signs that we do not have in our standard business. They make this point: In addition to the fact that the tax on these smaller signs would not raise any appreciable amount of revenue, this tax would amount to more than 20 percent of the gross annual rental received from these small signs which would bankrupt the companies erecting them. There are nearly 30,000 small signs on blackboards in farmers' front yards on which the farmers advertise their farm products and which also state the mileage to the store of some nearby merchant who pays a few cents a month rental. The proposed minimum tax of $1 per year would mean the elimination of these signs and would put out of business the companies which erect them.

Senator BARKLEY. Have you got any suggestion for a tax that anybody will pay that will raise this $1,191,000 that will be lost if this tax is eliminated?

Mr. STEWART. Senator, I am not a tax expert. I think I can well leave that to the Treasury Department to make an appropriate suggestion to you.

Senator BAILEY. That is the gross revenue, the $1,191,000. You would have to deduct from that the expenses; would you not?

Mr. STEWART. My contention is, it would not raise any revenue whatever. My further contention is because of the fact that all the people in the outdoor advertising business who are making any money are paying income taxes at this time, that if you lower their revenue you are going to get less income taxes in addition to what you would lose on the other thing. Furthermore, there is the impediment to business.

Furthermore, such a tax will not produce any appreciable amount of revenue, because of the cost of its administration.

According to the best figures available, there are in the United States approximately 275,000 standard poster panels, which have an

advertising surface of about 210 square feet each and would therefore be taxed $3 each under the proposed tax, or a total of $825,000.

There are approximately 50,000 standard painted bulletins of various types with advertising surfaces ranging from less than 300 to 546 square feet which are operated by outdoor advertising companies. These are about equally divided between the larger and smaller signs so the average tax would be $6 each, producing another $300,000 gross revenue.

Outdoor advertising structures having an advertising surface of more than 600 square feet and which are maintained by those engaged in the business of outdoor advertising are relatively few, but assuming that there are 1,000 which is an outside figure, the gross revenue from them would be $11,000.

The number of structures not over 100 square feet in size (which would carry a tax of $1 each), and from 100 to 200 square feet in size (which would carry a tax of $2 each), maintained by outdoor advertising companies, is negligible, as 95 percent of such signs are owned by those who maintain them to advertise their own business. As the result of a survey made by our association in 1940, we estimate that the taxable revenue from these smaller structures would aggregate but $55,000.

Therefore, the total estimated possible gross revenue from the proposed tax is but $1,191,000.

The cost of collecting and administering any tax of this nature would be so great that the net return to the Treasury would be, if any, so small as not to justify the imposition of the tax.

On the other hand, although the Treasury would not benefit, the result to the outdoor advertising industry, as a whole, would be disastrous. Based upon the published financial statements of the more important concerns engaged in the outdoor advertising business, the net profits of all the outdoor advertising concerns in the membership of the Outdoor Advertising Association of America, which maintain at least 90 percent of all standard outdoor advertising facilities in the United States, aggregated approximately $3,436,000 which would indicate that the combined net profits of all those engaged in the outdoor advertising business did not reach $4,000,000 in 1940.

An additional tax of $1,191,000 would, therefore, absorb about 30 percent of the total net profit of the entire industry based on 1940 volume and in the case of the small operator would inevitably absorb his entire profit.

Because of the diversion of materials and manufacturing facilities to defense industries and the consequent reduction of advertising by the producers of automobiles, tires, gasoline, refrigerators, radios, and other classifications of consumer goods which have provided a large percentage of the total volume of outdoor advertising, it is logical to assume that the volume for 1942 will be considerably below that of 1940 and that net profit from the operation of an outdoor advertising plant ordinarily producing a reasonable profit, it only requires a drop of from 20 to 25 percent in volume to eliminate all profit. Therefore, the imposition of an additional tax of even $1,191,000, would result in the confiscation, at least for the immediate future of all possible profits of the outdoor advertising business in the United States.

If the profits of those engaged in the outdoor advertising industry are taken through such a tax, the Treasury will lose the revenue now obtained from them through income taxes and, together with the reduction in surtaxes for which the larger companies are now liable, less revenue to the Treasury will be obtained than if the proposed excise tax was not imposed.

The unfairness of a tax on outdoor advertising on the basis proposed in the revenue bill is apparent when you consider that even the smallest outdoor advertising operator would be taxed on every structure he maintained, whether or not it was being utilized and producing any revenue and even if the advertising space thereon was being donated by him in furtherance of the defense program.

We believe, for the reasons above given, that the Senate Finance Committee will serve the best interests of the Government, the public, and of business generally by deleting from the revenue bill the sections which levy a tax on radio and outdoor advertising, as well as the provisions for a tax on neon-tube signs, electric signs, and electric advertising devices.

Now, gentlemen, that is my argument. I have with me here today, other associates in our industry.

Mr. Kerwin H. Fulton, who is president of Outdoor Advertising, Inc., our selling agency; Mr. Herbert E. Fisk, of Chicago, who is executive vice president and general manager of the Outdoor Advertising Association of America; Mr. Edward C. Donnelly, the president of the Outdoor Advertising Association of America, and Mr. Leonard Trester, our Washington representative.

If you have questions that I cannot answer, I would like to have the privilege of asking one or more of these gentlemen to attempt to answer.

Senator GUFFEY. Is Mr. Abernathy here today?

Mr. STEWART. Senator Guffey, Mr. Abernathy, although he expected to appear, did not feel it necessary to make a statement, because he seemed to feel, after he read the brief, that it was unnecessary to present further arguments on behalf of organized labor.

Senator HERRING. Stewart is all right. He is from Iowa.

Mr. STEWART. Senator Herring ought to know. I have argued before him many times.

Now, Mr. Chairman, I would like the privilege of presenting a statement on behalf of the American Highway Sign Association, which I would like to have incorporated in the record.

The CHAIRMAN. You may present it to the clerk.

(The statement referred to is as follows:)

STATEMENT PRESENTED ON BEHALF OF THE AMERICAN HIGHWAY SIGN ASSOCIATION

Hon. Walter F. George, chairman, and members of the Finance Committee of the United States Senate: This brief is presented on behalf of companies engaged in erecting and maintaining the smaller type of advertising signs on private property adjoining highways, which signs are leased to advertisers on a monthly rental basis.

We realize full well the enormous task which confronts the Congress in attempting to raise the funds which are so vitally needed to finance our defense activity. We do not want to dodge our share of this burden. We stand ready to pay any tax on our profits which Congress may see fit to levy, but we feel that the proposed tax imposed by section 3269, part XI of H. R. 5417, on those leasing outdoor advertising structures to others is economically unsound, discriminatory, and unwise. We urge its complete elimination, and that

the necessary funds raised by some general tax which applies equally to all business and which does not discriminate against one industry and act as a business deterrent. We urge this for the following reasons:

1. WE BELIEVE THAT ANY TAX ON ADVERTISING IS ECONOMICALLY UNSOUND

The function of all advertising is to increase consumption and keep goods moving in large volume so that prices may be reduced and the luxuries of yesterday may become the necessities of today. Advertising is an important cog in the American business machine. It is the indispensable key to mass production. If you produce any article on a small scale, the price of that article will confine its use to a few wealthy people. But if you advertise the same article and build up its use to a point where mass production is possible, it will then be possible to reduce its retail cost so that everyone can buy it. This has been true of many articles now in common use which formerly were luxuries, such as electric lights, automobiles, radios, and numerous electrical appliances. To tax advertising is to slow down the American industrial machine, as it would mean that just that much less money would be available to produce sales. A tax on advertising is a tax on the machinery which is used to produce sales and profits. It is perfectly sound to tax the profits after they are earned, but we believe it is unsound to tax the medium which produces these profits. It would be just as reasonable to levy a poll tax on a company's salesmen at so much per head. You must not kill the goose that lays the golden egg.

2. WE BELIEVE IT IS UNFAIR TO TAX OUTDOOR ADVERTISING WHEN OTHER COMPETING ADVERTISING MEDIA ARE NOT SIMILARLY TAXED

Levying a tax on outdoor advertising without at the same time equally taxing other competing advertising media, such as newspapers, magazines, window displays, car cards, etc., would tend to make advertisers use these other advertising media, and would therefore be an unfair and unwise discrimination against one form of advertising. Outdoor advertising reaches a portion of the public which is not equally reached by any other advertising medium, and does it at a cost which is less than any other form of advertising. Any medium which promotes business at a small cost should be encouraged in these critical times, rather than being penalized by a discriminatory tax.

3. THE PROPOSED TAX WOULD PUT OUT OF BUSINESS THE MANY COMPANIES ENGAGED IN ERECTING AND SERVICING SMALL SIGNS WHICH ARE LEASED TO ADVERTISERS

These companies (generally known as "service companies") make contracts with advertisers to erect signs for them for periods generally ranging from 3 to 5 years for a small monthly rental, which usually ranges from 40 to 50 cents per month. Then the service company erects the signs for the advertiser at a cost which is usually over 60 percent of the amount which it expects to get back in rental during the life of the contract. If all goes well, by the end of the contract period the service company will have a fair profit for its efforts.

The proposed tax could not be absorbed by the service company without bankrupting it. Nor could it be passed on to the advertiser because his contract does not require him to pay it. These small sign service companies would, therefore, be legally liable for this tax, which they could not pass on to the advertiser and could not pay themselves. The inevitable result would be bankruptcy and the loss of the many hundreds of thousands of dollars which these companies have invested in their signs. It would also mean the throwing out of work of the thousands of highly skilled men who are now employed by this industry and the loss to the Government of the many Federal taxes which are now being paid by this industry. So instead of raising additional revenue, the levying of this tax would mean a loss of the revenue now received from this industry.

Let us give one concrete example of the effect of this tax: There are nearly 30,000 farmers throughout the United States who have blackboards in their front yards on which they advertise their farm products and which also state the mileage to the store of some merchant in a nearby city. Theses signs are erected by service companies and the merchants pay a few cents a month

rental. The proposed tax of $1 per year on these signs would eliminate them entirely and force out of business the companies which now erect them, because the amount of the rental cannot be raised and there is not a sufficient margin of profit to pay this proposed additional tax.

4. THE PROPOSED TAX WOULD RESULT IN ELIMINATION OF THE ONLY EFFECTIVE FORM OF ADVERTISING AVAILABLE TO MANY MERCHANTS IN SMALL TOWNS WHERE THERE IS NO OTHER ADVERTISING MEDIUM

A very considerable portion of the outdoor advertising structures used by American business to advertise its products are the smaller type of signs erected on farmers' land along highways. Some of these signs are used to advertise nationally advertised products, but the big majority of them are used by local merchants in small towns to advertise their goods and services and to bring to their places of business those who drive into or through the town. The small town hotel and restaurant, the local garage man, the local filling station, and the small town general store all use these small signs extensively to build up and maintain their patronage. In many smaller towns throughout the country this is the only form of advertising available. Thousands of these towns have no daily and often no weekly newspaper. They have no local radio station. The only means these merchants have of getting an advertising message to the public which will bring purchasers to their place of business is by signs erected on farm lands along roads leading into the town.

Many of these small signs advertising the services or goods of the small-town merchant are erected and maintained by some local sign company or some larger outdoor advertising company on a monthly rental basis, and would be included in the proposed tax on the business of leasing outdoor advertising space. The rental charged for these small signs is usually small—often ranging from 30 to 40 cents a month. The tax of $1 per year which each of these signs would have to pay under the proposed law would, therefore, amount to around 20 or 25 percent of the gross annual rentals from such signs. Obviously, most of these signs could not stand a tax at this rate and would therefore, have to be taken down. The result would be the cutting off of the only available form of advertising for many small merchants and the ruination of the business of those which erect this type of signs—and all without accomplishing the avowed purpose of this bill—namely, the raising of any substantial amount of revenue.

5. THE ELIMINATION OF THESE SMALL SIGNS BY THE PROPOSED TAX WOULD MEAN THE LOSS OF RENTALS WHICH ARE NOW PAID TO FARMERS ALONG HIGHWAYS BY MOST OF THESE SIGNS

This revenue does not amount to a large sum in any individual case, but in the aggregate it represents a cash income which the farmers who receive it are mighty glad to get. It's a little added income which, as one Illinois farm woman wrote her legislator, "may be the difference of putting oranges in little Molly's and Johnny's dinner pail."

CONCLUSION

For the reason therefore that we believe this tax to be economically unsound, discriminatory, and unfair, and because it would ruin the business of many outdoor advertising-service companies, destroy the only available advertising medium of many small-town merchants, take away some of the cash income now received by farmers for outdoor advertising on their property, and would not raise any substantial amount of revenue, our group urges this committee to eliminate any tax on outdoor advertising from the 1941 Revenue Act.

STATEMENT OF JOHN BENSON, NEW YORK, N. Y., PRESIDENT, AMERICAN ASSOCIATION OF ADVERTISING AGENCIES

The CHAIRMAN. Mr. Benson. Your name is John Benson, and you are president of the American Association of Advertising Agencies?

Mr. BENSON. Yes, sir.

The CHAIRMAN. Do you want to speak on the same matter that Mr. Stewart has just spoken on?

Mr. BENSON. From quite a different angle, Mr. Chairman, and in a broader way, because we are broadly interested in advertising, not in any single medium. I think I can cover the ground in about 7 minutes.

The CHAIRMAN. Make it as brief as you can, because we do not want to unnecessarily duplicate the testimony, of course.

Mr. BENSON. Yes; I understand it. Well, on behalf of that professional body that I represent, practitioners of advertising, I would like to protest against the levying of a tax on advertising or advertising media as provided in this bill now before the Finance Committee.

Advertising agencies have no direct financial interest in this tax, as it is not imposed upon them; nor do they have any bias in favor of any one advertising medium or group of media, using them all impartially when and as required to solve a given advertising or marketing problem for a client. Having any ownership interest in a medium of advertising would be a breach of our ethical code.

Hence we hold no brief for either the outdoor or radio broadcasting media as such. What we deplore about the proposed tax on them is the burden it imposes upon advertising itself and the cost of distributing goods. Advertising is but one of several forms of selling and is often used to facilitate or economize sales effort. If such a tax were imposed, manufacturers would either do less advertising and hence sell less goods, or they would continue to do the same amount of advertising at increased cost, which would tend to raise prices to consumers—to the extent, of course, that the tax is not absorbed by the medium, which may be done in part and for a limited period of time. We are more opposed to the principle than we are to the burden.

Now, if advertisers sell less goods, they employ fewer people to make them, and the tax would contribute to unemployment. If the manufacturer raises his prices, it would contribute toward inflation.

In addition to the above, a tax on advertising would be discriminatory between manufacturers who use advertising as a means of selling and those who use other forms of selling but do not use advertising.

One of the most important services that advertising renders to distribution is to save time, effort, and money in moving goods from producer to consumer. Cost of the media is a big factor, of course, in this economy of the advertising operation. It does not matter how effective the advertising appeal may be, to increase the cost of the channel used to reach a market will lower the efficiency just that much, with one or more of the following results:

1. Slow down civilian production and nondefense employment of labor. Printers and pressmen are not benefited by an offensive tax of this sort. Their employment depends on successful advertising, as a whole, which breeds more advertising and more printing, whatever the media used. One medium feeds into another.

2. Lessen volume of business done and reduce available net profit, from which more taxes could be derived.

3. Reduce the margin between selling price and cost of distribution, which might be used in raising wages or in improving product.

4. By raising the cost of selling, add to the upward spiral of prices with its trend toward inflation.

The plea has been made that this special radio tax is not imposed upon advertising, but on entertainment. In our opinion, this is not true. Only the commercial revenues are to be taxed. Commercial radio advertising is not entertainment, it merely uses entertainment as an aid in selling. Therefore, the tax is on a method of selling, not on entertainment.

May I say a word in conclusion, about the timely public service which can be rendered by advertising during the defense emergency and why it should not be handicapped or burdened in rendering that service.

Senator CONNALLY. You mean free advertising for the defense emergency?

Mr. BENSON. Well, some of it sometimes is free, Senator Connally, but I am talking about regular commercial advertising.

Senator CONNALLY. All right.

Mr. BENSON. This is an economic discussion of advertising. Advertising is a definite brake on inflation and high prices. It does not stimulate desire for more civilian goods than can be produced. It does not encourage indiscriminate demand by the public. It promotes good will for a specific product or service and does not stimulate immediate sale unless the product is available or can be adequately produced. Arousing desire for goods which conflict with defense production would not result in sufficient sales to pay for the advertising, and would also cause ill will instead of good will among customers.

Advertising thus renders an indispensable service by diverting public attention and desire away from such goods and toward those which can be made in abundance. This satisfies popular demand and builds up volume to absorb the expanded purchasing power of the masses employed in national defense. And is there any better hedge against inflation?

As the President has pointed out, the Nation needs all the economic activity it is possible to produce, for the welfare of its people and for financing the war effort. Advertising is the effective spur. How much better to tax wealth and net income than the means of producing them. To do the latter is like consuming seed corn instead of planting it and producing abundant crops for consumption. It would be killing the goose that lays the golden egg.

And the spur must be vigorous and effective to move an adequate volume of unrestricted production into consumers' hands, with so many lines being restricted by defense.

In times like these we should operate, it seems to us, our processes of making and selling goods as efficiently and inexpensively as possible. The proposed tax would impair that efficiency, and thus produce, we believe, much less total taxes.

Senator BARKLEY. Do you care to say that all the goods advertised will do what the advertiser says they will do?

Mr. BENSON. No, sir; Senator Barkley; but I can say to date, the advertising fraternity have done much to improve that situation, have done much to secure legislation which will improve it in the Wheeler-Lee law. Today there is very little advertising that is deceptive. There is more or less that is——

Senator BARKLEY (interposing). Exaggerated?

Mr. BENSON. Exaggerated. Some of it is nonsensical, that is, it plays on motives that are not very substantial. We are all aware of that. We are constantly trying to improve the situation.

Senator BAILEY. At the worst, you can compare it with political advertising, can you not?

Mr. BENSON. I do not feel free, Mr. Senator, to comment on that.

Senator CONNALLY. If we tax one form of advertising, do you favor taxing them all?

Mr. BENSON. I would rather put it the other way around, Senator, and tax none of them, because you are taxing the processes of distribution.

Senator CONNALLY. You are taxing something every time there is any sort of tax increase. You do not think the advertisers ought to contribute anything toward national defense? They ought to be left alone and just advertise and the rest of us pay by our sweat and blood?

Mr. BENSON. I think, Senator, we will have plenty of taxes to pay and plenty of losses to sustain due to the war, the priorities, and other things which might restrict advertising on a large scale, and much reduce the revenues of all advertising media.

Senator CONNALLY. Has not this business, the advertising business, been flourishing for many years? I see full-page ads all about this, that, and the other thing. In the last 2 or 3 years, have not they been doing a big business?

Mr. BENSON. No, sir. Quite a subnormal business for the last 10 years.

Senator CONNALLY. Do not go back that far. I am talking about the past 2 years. Have not they come right on up? Made a lot of money?

Mr. BENSON. I would say "no"; advertising has not made a lot of money.

Senator CONNALLY. You made some?

Mr. BENSON. We made some money; yes.

Senator CONNALLY. All right.

Mr. BENSON. Our figures show a net profit that is little more than half of what it was 7 or 8 years ago, in spite of the fact that the volume has grown.

Senator BARKLEY. Are you speaking for the advertising industry generally, or for the radio?

Mr. BENSON. I am speaking for the advertising practitioner. We do the professional job of making the plans and executing them for the client.

Senator BARKLEY. How many national advertising agencies are there?

Mr. BENSON. Oh, we have only about 125 members. They do about two-thirds of the national business, or a little more, I think.

Senator BARKLEY. The Outdoor Advertising, however, is one of the largest in the advertising business?

Mr. BENSON. That is a medium, pure and simple.

Senator CONNALLY. You are brokers, are you not?

Mr. BENSON. No; we are not brokers.

Senator CONNALLY. You get a rake-off if you handle the advertising?

Mr. BENSON. Well, we get paid a commission, Senator, just like an architect would, you know, or an engineer, on the volume of expenditures in the structure or in the advertising campaign.

Senator BARKLEY. All these billboards that you see all over the country, some of them marked above the picture "Outdoor Advertising Co."; some of them marked "Cusack." There used to be a firm named Cusack in certain parts of the country.

Mr. BENSON. There was.

Senator BARKLEY. Those cover a very large territory. There are some local billboard advertisers. I used to know a man in my own town who had probably a dozen billboards scattered over the county, and about once a week, he would go out and change the scenery. Of course, he was paid for it. It may have been an outdoor advertiser, it may have been a local advertiser. I do not know about how much profit he made, but he continued in that business for a long time, and was a good man.

All right, there is no complaint about that. I was wondering whether this outdoor advertising business is controlled largely by a few companies that have rented, or at least built in various sections of the country, their own billboards by getting the consent of some farmer to build one over in his field. To what extent is it controlled largely by a few companies?

Mr. BENSON. Well, Senator, that is something that the outdoor advertising industry is better qualified to answer. I am sure, from contact with the industry, every plant owner can rent or withhold renting his property.

Senator BARKLEY. Every plant owner? What do you mean by "plant owner"?

Mr. BENSON. The owner of the plant, the one who owns the poster panels, you know.

Senator BARKLEY. Is it a right that has to be purchased?

Mr. BENSON. He rents the locations from property owners, or residents.

Senator BARKLEY. Does he have to buy from anybody the right to go into a community and advertise in that way?

Mr. BENSON. Not that I know of.

The CHAIRMAN. Are there any further questions?

Senator LA FOLLETTE. Mr. Benson, I want to ask you a question. It is a fact, is it not, that when an advertiser allocates a certain amount of money for a campaign, that the competition, so to speak, between the various media is pretty keen?

Mr. BENSON. It is very keen.

Senator LA FOLLETTE. So would, or would not, this tax have the effect, not of decreasing advertising, in all probability, but simply discriminating against various media?

Mr. BENSON. I think it would definitely decrease advertising, because you cannot use advertising media indiscriminately.

Senator LA FOLLETTE. Suppose a man came to you and said, "I have got a million dollars I want to put in an advertising campaign." He might decide not to use certain media because it was paying taxes, but he probably would not cut his whole program, would he?

Mr. BENSON. What it might do, it would weaken the effect of it, because the campaign is built up of different messages to different

markets for different purposes, and each medium lends itself particularly well to a definite problem. Our job is like the job of a doctor who specifies certain pills. We would be as much handicapped if we could not use outdoor advertising as the doctor would if he could not use quinine or something else that was needed in a given situation. Our job is purely professional, that of analyzing the problem and applying the remedy, and using the medium which covers a certain market most effectively.

Senator CONNALLY. Let me ask you right there, when a man comes in to you for an advertising campaign, do not you advise him what kind of advertising is best to do?

Mr. BENSON. We do.

Senator CONNALLY. And sometimes you use a little of all of them?

Mr BENSON. Sometimes we can and sometimes we cannot. The plan that we develop, for instance, may lend itself to outdoor or radio, or to newspapers or mail follow-up.

Senator CONNALLY. Depending on the character of the product?

Mr. BENSON. Yes; or the aim of the advertiser, what he wants to accomplish in his market. He might want more distribution or he might want better distribution. He may want more sales, or he may have one problem or another that is solved more or less by appealing to the consumer or to the trade. You know, advertising is used for many purposes besides stimulating the sale of goods, especially in a time like this when it will be used very vigorously to render service to the customers, as to how to use the products they have now and cannot replace, how to extend the life of them; how to get the most value out of them. It is a great opportunity for the producer to build goodwill. He may not have the product to sell, but he wants to keep open his lines and he wants to establish all the goodwill he can.

Senator CONNALLY. This outdoor advertising tax is graded from $1 a year to $11 a year, and it goes from 100 square feet to more than 600 square feet, which is a billboard 20 by 30. A billboard that is 20 by 30 is big enough to blot a whole wheat field, if you get close enough to it.

Mr. BENSON. We use the standard billboard.

Senator CONNALLY. The maximum is $11 a year. How much would a billboard 20 by 30 earn in a year in the way of income, do you know?

Mr. BENSON. Well, I think it is probably $6 or $7 a month for the use of the board. The standard board is the one we utilize which we call a 24-sheet poster.

Senator CONNALLY. Does not that depend on the location, though, where it is, sometimes?

Mr. BENSON. Yes.

Senator CONNALLY. You would charge more for a billboard close to New York where more people can see it than you would for a billboard near Podunk where nobody can see it?

Mr. BENSON. That is right.

The CHAIRMAN. Thank you very much, Mr. Benson.

Mr. Charles E. Murphy.

STATEMENT OF CHARLES E. MURPHY, NEW YORK, N. Y., GENERAL COUNSEL, ADVERTISING FEDERATION OF AMERICA

The CHAIRMAN. Mr. Murphy, are you speaking on this same general subject?

Mr. MURPHY. I am, sir; and I think you will be relieved to know I can do it in less than 3 minutes.

The CHAIRMAN. Thank you.

Mr. MURPHY. My name is Charles E. Murphy. I am general counsel of the Advertising Federation of America.

The Advertising Federation of America is the only national organization representing both sellers and buyers of advertising. Among its members are 61 advertising clubs located in key cities in every section of the Nation. Our organization, therefore, is a horizontal one which reaches across the industry, and we are able today to bring you, very briefly, the viewpoint of the industry as a whole regarding these proposed taxes on radio as well as outdoor advertising.

I have just submitted my statement for the record, Senator. The gist or my statement is this: We subscribe to the premise that income must be taxed in order to meet the national emergency; but we maintain that to tax the processes which produce income is an economic fallacy, that advertising is one of the prime processes by which income is produced and that to tax it would defeat its own purposes.

Just one additional observation, because the argument in support of that premise is in my statement submitted for the record.

The CHAIRMAN. Yes; it will be entered in the record.

Mr. MURPHY. Right after the war, after I got out of the Army, sir, and before I became a lawyer, I wrote and planned advertising, with the help of others in my home town of Trenton, N. J. I did that for small firms and small factories in that city, and I saw them grow and prosper by the judicious use of advertising to promote their worthy products. From a few employees they grew until today they are fine, large, stable, formidable organizations.

A few years later I went to New York to engage in the larger advertising fields and there I saw and witnessed the bigger companies produce new products from time to time, practically every year, and promote those new products which were useful and beneficial to the public as a whole, again through the judicious use of advertising, and I saw many, many employees added to each company as those new products were promoted. To me, and to us, it was the American system of distribution working in its perfect cycle. Whether in the small town or the larger town, every advertising dollar that I ever saw spent was considered with great care and with great consideration.

The question always asked by the man investing his money in advertising is: "What good will this advertising dollar do my business? What sales will this advertising dollar produce for my business?"

A tax on advertising to us means this, that Congress would say to the businessmen and merchants of this country, "We are going to collect a tax on the wages that you are going to pay your salesmen," for advertising is nothing more nor less than mass selling. It is the cheapest, the best and only way to distribute the products of our mass production to 130,000,000 people.

Thank you very much.

Senator CONNALLY. Wait a minute. I want to ask you one question.

Mr. MURPHY. Yes, sir.

Senator CONNALLY. Of course, we are going to cut down on civilian consumption in many lines, automobiles, and I hope radios, and different things of that kind, the civilian goods. The result is there is probably going to be a bigger demand in some lines without advertising than there would be otherwise. Mr. Henderson is allocating, reducing, and fixing prices, and all that. Do not you think that advertising is really not as necessary in the present situation as it would be in normal times? When times are hard you are anxious to increase your sales. Would this be a good time for a tax on advertising?

Mr. MURPHY. On the contrary, sir.

Senator CONNALLY. I want to get your views.

Mr. MURPHY. Yes; I would be delighted to give them to you.

Advertising does not and did not in the last war urge or promote the indiscriminate use of consumer goods. What it did, and what it does today, is to regulate and control the proper flow of goods which are available for consumer markets. Advertising would be a help rather than a hindrance in the ordinary economic distribution of goods which we do not need for defense purposes. In fact, it is an essential, in our opinion, in that regard.

Senator VANDENBERG. For example, the great oil companies are now spending their own money to tell gasoline consumers how to most profitably use gasoline.

Mr. MURPHY. Yes.

Senator DANAHER. Moreover, Mr. Murphy, would it not be true, if you are going to tax outdoor advertising on that theory, you ought to tax newspaper and magazine advertising as well?

Mr. MURPHY. We, of course, hope you will not tax any, sir.

Senator BARKLEY. If the purpose is to stop people from buying, it does not make any difference whether they do advertise or not.

The CHAIRMAN. Thank you very much.

(The statement submitted by Mr. Murphy is as follows:)

STATEMENT OF CHARLES E. MURPHY, ESQ., OF NEW YORK CITY, GENERAL COUNSEL FOR THE ADVERTISING FEDERATION OF AMERICA, RELATIVE TO PROPOSED TAXES ON RADIO AND OUTDOOR ADVERTISING

The Advertising Federation of America is the only national organization representing both sellers and buyers of advertising. Among its members are 61 advertising clubs located in key cities in every section of the Nation. It, therefore, reaches horizontally across the entire advertising industry and presents here today the cross-sectional viewpoint of the advertising fraternity regarding the proposed taxes on outdoor and radio advertising.

We consider any tax on advertising, regardless of the media affected, as harmful to the economy of our Nation and detrimental to our well-established system of distributing consumer goods.

The power of advertising, as the selling force of industry and as the stimulator and stabilizer of commodity distribution, must be protected. This is necessary in supporting the base for emergency taxes, for any impairment in the use of advertising by taxation will in turn affect distribution and the revenues derived therefrom. In our opinion, a tax on advertising will defeat its own purpose.

We are mindful that vast sums of money must be raised by our Government for national defense. This involves the greatest merchandising effort in the history of our country. Hence it is that our merchandising machinery must be keyed up to the highest notch of efficiency.

Business uses advertising to maintain and increase its outlets for goods. Unless such outlets are maintained and increased during the coming years, the expanded income on which taxes are based will not be forthcoming. Nothing should be done, therefore, to cripple the merchandising machine that produces income, and a tax on advertising will bring that very result. Income must be taxed, but to tax the process which creates income is an economic fallacy.

Advertising does not encourage indiscriminate expenditure for civilian goods during the period of national defense. On the contrary, it is used to regulate and stimulate the proper flow of consumer goods based on the products available for nondefense purposes. Advertising will divert public demand to merchandise that can be supplied without harming our defense production and thus keep employment and distribution in nondefense industries at its highest possible level.

As late as May 20, 1941, President Roosevelt in a letter to our organization, said:

"Advertising has been responsible for many of the good things which citizens of the United States enjoy. It has been a potent force in making available to our citizens the products of American skill and ingenuity. Without it, many present day necessities would still be luxuries.

"That force needs now to be applied toward the maintenance of our accustomed standards of living and further progress. This may require adjustment but it should mean increased effort."

The advertising business in America is wholeheartedly behind our Government's monumental efforts for national defense. In common with other businesses, it is paying today, and will continue to pay, huge sums in taxes into our National Treasury.

We have offered our services to the Government and will continue to give them willingly, as it is our duty to do.

We strongly urge, however, that a tax on advertising, regardless of its nature, will be a grave economic mistake and harmful to the laudable and patriotic cause to which you, your colleagues, and all other good Americans are firmly dedicated.

May I, sirs, in just a few seconds, add a personal observation? Before becoming a lawyer, I planned and wrote advertising for small stores and small industries in my home town of Trenton, N. J. I saw these small firms grow and prosper by promoting worthy products through the judicious use of advertising. From a few employees I saw them grow to employ many people. I later went to New York to engage in advertising in its larger fields, and there I saw companies place on the market many new, fine, and useful products of real benefit and utility to the American people. I saw advertising used to promote and distribute these products. I saw employees added in great numbers as consumption grew. It was the American system of mass distribution working in its perfect cycle.

Whether it was in the smaller city or the metropolis, I never saw a dollar spent for advertising except with the greatest care and consideration. Always the question asked was: "What sales is this advertising dollar going to produce?" A tax on advertising is no different than Congress saying to a merchant or manufacturer: "We're going to collect from you a tax on the wages you pay your salesmen." For advertising, gentlemen, is mass selling and nothing else. It is the best, cheapest, and only system through which the products of our mass production may reach the consuming public.

The CHAIRMAN. Mr. McMillan.

STATEMENT OF G. S. McMILLAN, NEW YORK, N. Y., SECRETARY, ASSOCIATION OF NATIONAL ADVERTISERS, INC.

Mr. McMILLAN. Mr. Chairman, and gentlemen of the committee, my name is G. S. McMillan. I am secretary of the Association of National Advertisers, Inc., appearing against the imposition of taxes on advertising in both sections of the bill, having to do with radio and outdoor advertising.

I would like to explain that the Association of National Advertisers, Inc., is a nonprofit membership corporation incorporated under the laws of New York State. It is composed of some 300 manufacturers,

all of whom use advertising as an aid to selling. Its membership is Nation-wide and includes companies from almost every industry—steel, shoes, grocery products, drug products, textiles, and so forth. Represented are both large and small companies, with advertising appropriations ranging from the largest to well under $50,000 a year, a true cross-section of American business.

Membership in the association is open only to corporations selling goods or services other than advertising. Publishers, advertising agencies, outdoor plant owners, radio-station operators, and others engaged in selling advertising are not eligible for membership.

As an association composed solely of manufacturers who are all buyers of advertising, with no financial or controlling interest in any advertising medium, we hold no brief for radio, outdoor, newspapers, or other advertising medium per se. An essential part of the business of such media is the sale of advertising: The principal business of the members of the Association of National Advertisers is manufacturing.

But while we have no particular interest in any one medium, we are vitally concerned with the preservation of the American advertising system and hence in the welfare of all media. We are concerned in the maintenance of free and open competition between media.

We believe the taxes proposed in title V, section 557, and title VI, section 601 of H. R. 5417 are unsound, unfair, and discriminatory, and that therefore they should be eliminated.

We have seen no argument whatever in favor of the tax on outdoor advertising. We have seen no argument in favor of the tax on radio advertising except one which proposed such a tax principally as a punitive matter designed to correct alleged unfair competition. If there has been unfair competition—which we do not admit—there are adequate laws dealing with that subject and existing Government agencies whom Congress has designated to administer them.

Senator BARKLEY. What sort of unfair competition is it?

Mr. MCMILLAN. The only argument I have seen in favor of a radio tax bill came from an organization, I believe, in the printing-trade unions who said it was an unfair competition between the newspapers and radio. It did not mention outdoor at all. I have forgotten just what arguments they used, but the gist of the argument was unfair competition.

We do not believe a revenue measure should be used to confer police power. Further, we believe it is significant that there has been, to our knowledge, no proposal of such taxes on outdoor and radio advertising by publishers of magazines or newspapers nor any testimony favoring the taxes from them.

It has also been argued that the proposed tax on radio advertising is an amusement tax. This hardly seems plausible. Amusement taxes in the United States are imposed upon and paid by those enjoying the amusement. Taxes on admissions to theaters, athletic games, and the like are paid by those who purchase tickets, not by the motion-picture companies or the promoters of the amusement. Such is not the case with the proposed tax on radio advertising. Again, the tax would be imposed on radio time sales. That means on sponsored programs only, in other words, on advertising.

No tax is proposed on sustaining programs, on the broadcasting of special events, speeches, and so forth, which are just as surely entertainment as is sponsored material.

Senator VANDENBERG. That is theoretical.

Mr. MCMILLAN. No tax is proposed on magazines, nor should there be—and magazines are designed as and purchased for entertainment. No tax is proposed on newspapers, nor should there be—and yet sponsored news broadcasts are to be taxed.

Senator VANDENBERG. Huey Long tried that once, did he not?

Mr. MCMILLAN. He tried it in Louisiana; yes.

In view of the above, we cannot view the proposed levies on outdoor and radio in any other light than as a direct tax on advertising. Further, as practical businessmen, we know that tax will be passed on to the manufacturer, the buyer of advertising.

We believe it is unwise and unsound to tax advertising. We in this country are engaged in mass production. In order to have mass production we must have mass distribution, and in order to have mass distribution we must have advertising. It is a vital part of selling and by far the most economical way to move the goods made by the men in our factories.

Advertising is not a finished product. It is a business process—just as important and essential a business process as is engineering or production. It is a function not a product. Taxing one function of business, isolating that function and imposing a tax upon it is, to our mind, unsound.

There is nothing mysterious, there is nothing impractical about advertising. On the contrary it is one of the most practical processes in our whole system of free competitive enterprises. It is the means of telling the public what there is for sale and where it can be obtained.

More than any other force in business, advertising has a stabilizing effect, not only on business but on our economy generally. Aside from its benefits to consumers, it has enabled business to expand and grow. That expansion and growth has made for stability for the future, not only for business, but also for all of those engaged in business. The effect of that stability has been to contribute to a feeling of security for the future on the part of all employees of business and to enable business to operate on a sound basis. When business is conducted along lines that are sound and stable, it can be depended upon to make a reasonable profit. Unless it does make a reasonable profit it cannot continue and if it cannot continue, it not only makes for unemployment but dries up the principal source of revenue for the Government and defense.

It is to the profits of business that Government must look for a large part of the revenue that is to be raised through taxation. To discourage advertising through taxation or to make it impossible for business to advertise will be to strike at the very source of the income the Government now needs so badly.

A tax on advertising would not only seriously cripple one of the most vital tools of business, but it would also cripple the media concerned, all of which are substantial taxpayers and employers of labor. Incidentally, we see no way in which the proposed taxes could possibly benefit labor. The effect would be quite to the contrary.

The proposed taxes would also have a bad effect upon the hundreds of thousands of retailers in all lines of business. Advertising by the manufacturer creates demand for products, moves goods from the retailers' shelves. To cripple advertising would be to slow down that demand, to make for slow turn-over and hence lower the profits of the retailer.

The function of advertising, now of all times, is to strengthen the national economy to meet its burden. As President Roosevelt has said:

> It has been a potent force in making available to our citizens the products of American skill and ingenuity—that force needs now to be applied toward the maintenance of our accustomed standards of living and further progress.

It is from the Nation's nondefense business that the sinews of war must finally come. To hamper that business is to weaken those sinews.

Advertising is needed now as never before. Let us take a hypothetical example. There has been a wave of hysterical buying on the part of the public of silk stockings. The United States Department of Agriculture has been working for some time, we understand, on the development of stockings made from other fibers. If, as, and when, it becomes necessary to tell the women of America of these new fibers and of the stockings made therefrom, what force can be substituted for advertising to do that job? What other means will there be to spread the knowledge of this new discovery, to convince women that their beauty will be enhanced rather than impaired by the use of the new products made from articles of American manufacture? If there is a better way, manufacturers would certainly like to know about it.

In addition to this at-the-moment viewpoint, there is also involved the matter of the future. When we find ourselves out of the present emergency, what force at our command could be utilized to better advantage than advertising to maintain the greatly increased productive capacity with which we will undoubtedly find ourselves, to make for stability of employment?

The National Resources Planning Board on August 12—only 2 days ago—released an interesting report made at the suggestion of President Roosevelt in which it warned the Nation that the United States can win the war and still—

> lose everything we are arming to defend if, in the transition to peace we slip back to a low national income with its inevitable unemployment, suffering chaos, and loss of freedom.

We do not feel that it would be sound or wise to cripple a force that may be so much needed later to enable us to carry on. There will come a time when it will be highly desirable to stimulate nondefense industry. Advertising, which has been called the dynamo of business, is the force to accomplish that purpose.

We are entirely aware of the necessity which lies upon all of us to bear increased taxes. We are entirely willing to carry our share of the load. All manufacturers are willingly meeting the increased burden of taxation which has necessarily been thrown upon them, which has arisen from a situation which is neither of their own making nor to their liking. To tax advertising, however, would be to impose a burden on a business function which helps to make sales and thus helps to make taxes.

The money to be derived from the taxes proposed in the bill on radio and outdoor advertising, even if the estimates are correct, would not seem to be vital to the success of the tax measure. Further, we believe that the American public would pay a far greater price for the tax and its collection than any benefits that might be derived therefrom.

In view of the above, the Association of National Advertisers respectfully urges that the committee eliminate the taxes proposed in sections 557 and 601.

That is the statement. I would like to add one thing in answer to a question which was raised. Advertising expenditures as percent of national income declined from a high of 3.75 in 1914 to a low of 2.31 in 1940; from a high of $19.62 per capital of our population in 1926 to $12.61 in 1940. There was spent in 1940 in the United States an estimated total of $1,660,000,000 in advertising, a loss of $450,000,000 over 1929.

The amount of money spent for advertising has not increased in ratio to the national income. The national-income curve has been going up and the advertising-expenditure curve down.

The CHAIRMAN. On the question of radio, it may not justify any tax placed upon advertising over the radio. I am not making the suggestion for that purpose, but since radio is a facility that must be regulated, and since it is costly to regulate a system of that kind, would not there have to be some form of franchise tax to pay for the cost of regulating that?

Mr. MCMILLAN. That would be something that has to do with the radio industry, which I am not prepared to answer for.

The CHAIRMAN. That has nothing to do with advertising?

Mr. MCMILLAN. Nothing to do with advertising.

The CHAIRMAN. But it does have to do with the whole business?

Mr. MCMILLAN. It might, perhaps. But such a matter belongs in the Federal Communications Commission Act and not in a revenue bill.

The CHAIRMAN. Thank you, Mr. McMillan.

Mr. Warren.

STATEMENT OF WILLIAM C. WARREN, NEW YORK, N. Y., REPRESENTING TRANSIT ADVERTISERS, INC.; CHICAGO CAR ADVERTISINT CO.; AND TRANSPORTATION DISPLAYS, INC.

Mr. WARREN. Mr. Chairman, and gentlemen of the committee, my name is William C. Warren. I represent the Chicago Car Advertising Co., 333 North Michigan Avenue, Chicago, Ill.; Transit Advertisers, Inc., North Station, Boston, Mass., and 30 Rockefeller Plaza, New York City; and Transportation Displays, Inc., 9 Rockefeller Plaza, New York City. These companies represent three out of a total of five companies engaged in the business of displaying advertising material on properties of common carriers.

I want to address my remarks to section 3269 of the revenue bill of 1941, as passed by the House of Representatives, which section imposes a graduated tax on every person engaged in business as a lessor of billboards for outdoor advertising.

Because these companies are in somewhat of a different position, it is felt desirable to acquaint you with their peculiar problems, and we do not feel we are more or less duplicating this information that has been furnished you.

It is not clear that this excise tax is applicable to advertising displays located on properties of common carriers; however, if it is applicable it will force these three companies to discontinue and, hence, cause a complete destruction of this advertising-display business. The advertising displays of these companies are commonly referred to as one-, two-, and three-sheet displays, consisting of 8, 18, and 24½ square feet, respectively. These advertising displays are located on properties of subways, elevated trains, and railroads, principally in and around the areas of Boston, Chicago, Philadelphia, New York City, and New England generally. Chart A gives you in detail the States in which the advertising displays of these companies are located and on whose properties. You will notice that there are 12 States in which they have their advertising displays.

CHART A

State, Common Carrier, and Advertising Organizations

Connecticut:
  Transit Advertisers, Inc.:
    New York, New Haven & Hartford Railroad.
    The Connecticut Co.
Illinois:
  Chicago Car Advertising Co.:
    Chicago Rapid Transit.
    Illinois Central Railroad.
Indiana:
  Transportation Displays:
    Erie Railroad.
Maine:
  Transit Advertisers, Inc.:
    Maine Central Railroad.
    Boston & Maine Railroad.
Massachusetts:
  Transit Advertisers, Inc.:
    Boston & Maine Railroad.
    New York, New Haven & Hartford Railroad.
    Boston Terminal Co.
  National Transitads:
    Boston Elevated Railway.
New Hampshire:
  Transit Advertisers, Inc.:
    Boston & Maine Railroad.
    Maine Central Railroad.
New Jersey:
  Transportation Displays:
    Lackawanna Railroad.
    Erie Railroad.
    Central Railroad Co. of New Jersey.
    New York, Susquehanna & Western Railroad.
  Transit Advertisers, Inc.:
    New Jersey-Cortlandt Street Ferry Co.
New York:
  Transit Advertisers, Inc.:
    New York, New Haven & Hartford Railroad.
    The County Transportation Co.
    Long Island Railroad.
    Pennsylvania Railroad.
    New Jerrey-Cortlandt Street Ferry Co.

New York—Continued.
Transportation Displays:
New York Central Railroad.
Lackawanna Railroad.
Erie Railroad.
Central Railroad Co. of New Jersey.
New York Subways Advertising Co.:
New York City Subways.
Ohio:
Transportation Displays:
Erie Railroad.
Pennsylvania:
Transportation Displays:
Lackawanna Railroad.
Erie Railroad.
National Transitads:
Philadelphia Rapid Transit.
Transit Advertisers, Inc.:
Pennsylvania Railroad.
Pennsylvania-Reading Seashore Lines.
Camden-New Jersey Ferry Co.
National Transitads:
Philadelphia Rapid Transit.
Rhode Island:
Transit Advertisers, Inc.:
New York, New Haven & Hartford Railroad.
Vermont:
Transit Advertisers, Inc.:
Boston & Maine Railroad.
Maine Central Railroad.

These companies, in reality, are merely agents of the common carriers because of the constant close control exercised by the carriers and the degree with which they scrutinize the advertising to be displayed on their properties.

Senator VANDENBERG. Where is that in the tax bill?

Mr. WARREN. On page 78, sir. These advertising companies do not own their own display structures as do the outdoor companies. Displays are placed, changed, relocated, and removed at the request of the common carriers. The number of displays on any particular location is also determined by the common carrier. In actual practice the common carriers frequently require displays to be changed due to the alteration of a station, the improvement of a station, or for other reasons, and all such changes have to be made at the expense of the advertising-display companies. Even in respect to the advertising material to be displayed, the common carriers exercise control, and from time to time will not allow certain advertising displays on their properties. Thus, it is evident that these companies are in effect merely agents of the common carriers.

All of the five companies displaying advertising material on properties of common carriers were recently organized, with the exception of one of the companies, and each of the five companies is owned by several individuals, none of whom is affiliated in any way. These companies have taken over to a degree the advertising displays on properties of common carriers of those companies which formerly were operated by the late Baron Collier.

The CHAIRMAN. Let me ask you——

Mr. WARREN. Yes, sir.

The CHAIRMAN. Do your companies own the board?

Mr. WARREN. My understanding is that with one exception these display boards are not owned by these companies but that the common carriers own them. One company, however, does own the small steel frames which are placed on the side of the station.

The CHAIRMAN. You own that?

Mr. WARREN. Yes; one company owns that.

The CHAIRMAN. You own the space.

Mr. WARREN. Yes. In the case of one company, it simply owns a steel frame that is placed on the side of the station, wherever the common carrier says we can place it.

The CHAIRMAN. Yes.

Mr. WARREN. Senator, in the case of all companies, we may want to place one display on a station but the railroad says, "No, no; you will ruin the symmetry of this station if you do not place another here [indicating] or two here [indicating]," so we may have to place three there instead of one. We have that difficult problem to face constantly.

This excise tax contained in section 3269 of the House bill should not be applicable to advertising displays on properties of common carriers for the following reasons:

1. Any excise tax on companies handling advertising displays on properties of common carriers would be confiscatory and ruinous to every company now engaged in such business.

2. The 40 to 60 percent of gross revenue demanded and obtained by common carriers under long-term contracts with these companies makes any excise tax such a burden as to constitute a death penalty.

3. An excise tax on only outdoor advertising is highly discriminatory and unfair.

4. The graduated rates proposed in section 3269 of the House bill are discriminatory and unfair.

5. State legislation taxing outdoor advertising has always recognized and exempted as a class, outdoor advertising on properties of common carriers.

Senator VANDENBERG. Let me ask you at that point, to what point do the States tax outdoor advertising?

Mr. WARREN. Senator, there are probably 14 States, I think, that tax outdoor advertising in some way. In most instances, it is regulatory rather than as a source of revenue.

6. This excise tax, if applicable to advertising displays on properties of common carriers, will yield approximately $75,000 annually from those companies having advertising displays on properties of common carriers; the obvious small net receipts to the United States Treasury after deducting the cost of administering the tax and the inherent discrimination and unfairness of this excise tax should militate against its application to advertising displays on properties of common carriers; hence either this excise tax on outdoor advertising should not be retained as a part of the revenue bill of 1941 or an amendment should be incorporated whereunder advertising displays on properties of common carriers are expressly exempted.

I. Any excise tax on companies handling advertising displays on properties of common carriers would be confiscatory and ruinous to every company now engaged in such business

If the graduated excise tax rates imposed by section 3269 of the House bill are applicable to the advertising displays on properties of common carriers, these three companies will not be able to continue this medium because the added burden cannot be assumed with the present small annual net profit per each advertising display nor can this excise tax be passed on because of long-term contractual arrangements with the common carriers and advertisers. No tax law should be designed to destroy legitimate businesses, but if this tax on outdoor advertising is applicable to the advertising displays of these companies, it will have that very effect in that it will be confiscatory and ruinous to the companies.

At the time this excise tax was considered by the Committee on Ways and Means of the House of Representatives, no public hearing was held on the merits or demerits of the tax. For that reason, that committee was not familiar with the problems of such companies nor with the financial difficulties of those advertising companies selling the use of this medium. Each of the three petitioning companies has had its auditors prepare a careful study of the number of advertising displays and the net annual profit for each display for the first 6 months of 1941 plus the estimated net profit for the last 6 months of 1941.

You will notice from this chart (see chart B) that the estimated 1941 annual profit per one-sheet display before deduction for Federal income tax for Chicago Car Advertising Co., is $0.106, for Transit Advertisers, Inc., is $0.124 and for Transportation Displays, Inc., is $1.02. If you will then examine the computed annual profit per foot and the computed tax rate per foot you must conclude that such an excise tax would be ruinous to these companies. You will also note that if this excise tax is applicable to the one-sheet displays that the proposed rate would be $0.125 per square foot while on an outdoor billboard of 100 square feet the proposed rate would be $0.01 per square foot.

CHART B

Chicago Car Advertising Co.

Number of displays [1]	Size of frame	Square feet per unit	Annual net [2] profit per display	Total square feet	Computed [3] annual profit per foot	Computed tax rate per foot	Allowable [3] tax rate per foot
7,126	1 sheet	8	$0.106	57,008	$0.01325	$0.125	$0.01
2,784	2 sheets	18	.249	22,272	.0138	.0555	.01
3,729	3 sheets	24½	.318	91,360	.0130	.0408	.01

[1] Over 65 percent not rented.
[2] Before deduction for Federal income tax.
[3] Based on proposed tax, if applicable, of $1 per 100 square feet.

CHART B—Continued

Transit Advertisers, Inc.

Number of displays [1]	Size of frame	Square feet per unit	Annual net [2] profit per display	Total square feet	Computed [3] annual profit per foot	Computed tax rate per foot	Allowable [3] tax rate per foot
2,759	1 sheet	8	$0.124	22,072	$0.0154	$0.125	$0.01
1,879	2 sheets	18	.252	33,822	.3148	.0555	.01
5,287	3 sheets	24½	.266	129,531.5	.0108	.0108	.01

[1] Over 40 percent not rented.
[2] Before deduction for Federal income tax.
[3] Based on proposed tax, if applicable, of $1 per 100 square feet.

Transportation Displays, Inc.

Number of displays [1]	Size of frame	Square feet per unit	Annual net [2] profit per display	Total square feet	Computed [3] annual profit per foot	Computed tax rate per foot	Allowable [3] tax rate per foot
489	1 sheet	8	$1.02	3,912	$0.1275	$0.125	$0.01
492	2 sheets	18	.73	4,336	.0105	.0555	.01
1,127	3 sheets	24½	1.94	27,615	.0791	.0108	.01

[1] Over 20 percent not rented.
[2] Before deduction for Federal income tax.
[3] Based on proposed tax, if applicable, of $1 per 100 square feet.

Senator DAVIS. Is that a rate for a year?

Mr. WARREN. Yes; that is the rate for a year. That is 12½ cents per square foot on the 1-sheet displays, as contrasted with 1 cent as allowable under the act.

This is so patently discriminatory that no further comment will be made.

By examining the figures compiled by each company as to 2-sheet and 3-sheet displays you can obtain a complete picture of the disastrous effect of such an excise tax on 1-, 2-, and 3-sheet displays on properties of common carriers.

Some comments should be made as to the reasons for these low annual profits per display.

In the first place, in every instance but one, these companies were recently organized as has been previously pointed out and furthermore advertising display companies always have considerable display space that is not sold. You will note on the chart as to each company that the amount of space as unsold is indicated in a footnote. Over 65 percent of the display space of the Chicago Car Advertising Co. is not sold, over 40 percent of the Transit Advertisers, Inc., is not sold and over 20 percent of Transportation Displays, Inc., is not sold.

Senator DANAHER. A question there, please.

Mr. WARREN. Yes.

Senator DANAHER. You do not say, Mr. Warren, that you would be compelled to pay a tax on space that is not sold, do you?

Mr. WARREN. We would, for this reason, sir; we may have a display in one space only for a week where there is compensation derived. In other words, over the period of a year, every space will be filled for a short time, a week, maybe 3 months, maybe the whole year. In other words, as you will recall, from chart B, the Chicago Car Advertising Co. has 7,000 1-sheet displays. During the course of the year,

every one of those displays will have some kind of advertising for compensation. It may be only for a week, or maybe for more time, but we would fall under the act because of that reason.

The act says "for compensation."

Senator DANAHER. Your argument is, if the board were rented for 1 month out of 12, it would still have to pay a tax?

Mr. WARREN. For 1 day, sir. Even though the display space may not be sold the common carriers require that every space have an advertising display in order that the blank space will not make their properties less attractive. These blank display spaces of necessity, being always filled with nonrevenue displays, such as supplied by civic, national organizations, Navy and Army, and gratuitous displays from advertisers already purchasing space, create the impression with many unfamiliar with the business, that it is highly profitable and can easily, without any financial difficulty, pay the proposed graduated excise taxes.

Any depressed business such as the representatives of the sale of advertising displays on properties of common carriers should not be subjected to excise taxes as proposed in section 3269 of the revenue bill of 1941. Within the past few months additional hope has been manifested for the future of these small and independent companies operating these advertising displays. However, any tax such as that proposed in section 3269 would destroy every possibility of any profit to be derived from their activities, even though the advertising display business was now functioning at the peak of activity which it formerly operated.

II. The 40 to 60 percent of gross revenue demanded and obtained by common carriers under long-term contracts with these companies makes any excise tax such a burden as to constitute a death penalty

Any common carrier which has space available for advertising displays exacts a high percentage of gross revenue from the advertising company because the common carrier brings together a private audience composed of its fare-paying passengers.

Being directly responsible for bringing together the private audience and also having complete control of the advertising material which is visible in and about their stations, platforms, and other structures, these common carriers have always demanded as a minimum 40 percent of the gross revenue derived by advertising display companies and, in many cases, as high as 60 percent of the gross revenue. In all cases, the advertising display companies enter into long-term contracts with the common carriers whereunder during the period of the contract these percentages of gross revenue are to be paid irrespective of any additional costs which the advertising companies might encounter. This high percentage of gross revenues taken by the common carriers must be contrasted with the percentages taken by those other than common carriers. The minimum required by them is 5 percent of gross revenues with a maximum of possibly 20 percent.

Upon analysis, the reason is evident for this great disparity between the percentages of gross revenue taken by the common carrier and one not a common carrier. One who is not a common carrier does not assemble a private audience nor do they provide the facil-

ities for such an assembly, but must rely wholly upon the whims and fancies of the public to pass the location or upon the fact that the location is on some strategic highway, constructed and maintained by public funds. Obviously, one depending upon a public audience cannot exact the same percentage of gross revenue that one can who assembles a private audience within the confines of private property. For that reason, common carriers have always demanded and have justly obtained high percentages of gross revenues from advertising companies displaying advertising on their properties. Under such conditions, those companies displaying advertising on properties of common carriers are not in a similar position to those advertising companies displaying advertising along public thoroughfares. Any excise tax such as that proposed in section 3269 would only serve to increase the competitive disadvantages of those companies having advertising displays on properties of common carriers.

III. This excise tax on outdoor advertising is highly discriminatory and unfair

The revenue bill of 1941 as passed by the House of Representatives does not propose to levy an excise tax on all classes of advertising, but only on certain classes. Such taxation violates a fundamental principle of an excise tax, that it should be uniform and apply equally to all classes affected. By far the greatest amount of advertising is through the use of 2 other media—the newspapers and magazines. To tax the use of the medium of outdoor advertising displays and not the use of the other media obviously is highly discriminatory and unfair. Such discrimination places the taxable medium at an economic disadvantage and will result in the untaxed media continually making inroads on the taxed medium because of the competitive advantages created and maintained by such apparent unfair taxation. This result is inevitable in a field of business activity which is as highly competitive as the advertising business.

IV. The graduated rates proposed in section 3269 of the House bill are discriminatory and unfair

The very language of section 3269 of the House bill excludes more outdoor billboards than have been included for taxation. The only billboards that would be subject to this excise tax would be those which were owned and controlled by one "who engaged in business as a lessor of billboards."

Congressman Martin J. Kennedy, of the Eighteenth District of New York stated in a speech before the House of Representatives that there were five times as many billboards outside this classification as there were within the classification. Not only is this proposed excise tax discriminatory as to this exclusion, but also the rates graduated from $1 to $11 are also highly discriminatory and unfair.

Senator DANAHER. Another question. Will you break down a little better, not in terms of what Mr. Kennedy said in the House, but what you said here, as to why so large a percentage of boards do exclusive advertising of one product?

Mr. WARREN. If an advertiser, instead of going to the Outdoor

Advertising Co., or some company that is a lessor of billboards, simply erects his own board, then it is not subject to a tax under this act. The result is that most of the boards are under that classification, and you have most of them excluded. Furthermore, if you do enact this kind of tax, those people who are going now to the advertising agencies to have it done, are going to start doing it themselves and avoid the tax. So it is one of the things that is going to have a very definite economic effect on this business.

Senator DANAHER. For instance, as we drive along the highway, we see a sign advertising Burma-Shave. Does the agency maintain that, or does some company do it?

Mr. WARREN. I am not certain about Burma-Shave, but I know quite a number of companies who do maintain their own signs and put up their own signs, particularly in the smaller localities.

Senator DANAHER. If that particular company actually does put up the signs, it does meet the point you make?

Mr. WARREN. That is right. It is not subject to the tax, while those boards of an agency are subject to the tax.

Senator DAVIS. Some of the signs do not contain a complete sentence.

Mr. WARREN. Yes.

Senator DAVIS. There is a series of boards running along with a word or two on each.

Mr. WARREN. Yes.

Senator DAVIS. Will each one of those be taxed on the billboard rate?

Mr. WARREN. Oh, yes; no question about that, if they are for compensation.

If the excise tax is applicable to 1-, 2-, and 3-sheet displays on properties of common carriers, a 1-sheet display of only 8 square feet which obviously would carry a very nominal annual rental, is taxed at $1, whereas the same rate of tax applies to a billboard of 100 square feet which would have a considerably larger annual rental.

Not only would there be a great disparity in the annual rent in these instances, but also as it has been pointed out before, the percentages of gross revenue demanded and paid by the companies maintaining advertising displays on properties of common carriers is considerably higher. Obviously, less of the gross revenue is retained by those companies having advertising displays on properties of common carriers and therefore the application of this rate to the 1-, 2-, and 3-sheet advertising displays on properties of common carriers is doubly discriminatory and inequitable.

V. State legislation taxing outdoor advertising has always recognized and exempted as a class, outdoor advertising on properties of common carriers

Several States have already had a history in the taxation of outdoor advertising. This is particularly true of the New England States. In the States of Maine, New Hampshire, and Vermont, legislation has been enacted taxing billboards, but such legislation expressly contains an exemption for advertising displays on properties of common carriers. The exemption provision of the Vermont taxing statute is as follows:

This chapter * * * shall not apply to signs and other devices on or in the rolling stock, station, subways, or structures of or used by common carriers * * * (Sec. 8349, Public Laws, 1939).

The exemption provision of the Massachusetts taxing statute is as follows:

Certain signs, etc., exempted—sections 29 to 31, inclusive, and 33, shall not apply to signs or other devices on or in the rolling stock, stations, subways, or structures of or used by common carriers, except advertising signs or other advertising devices on bridges or viaducts or abutments thereof (Annotated Laws of Massachusetts, ch. 93, sec. 32).

Senator WALSH. Are those cards that are on streetcars and elevated railroad cars included in this bill?

Mr. WARREN. No, sir. They would not be included in the bill, because they are not outdoor advertising.

It has previously been indicated that the advertising displays on properties of common carriers were the 1-, 2-, and 3-sheet displays, which were only 8, 18, and 24½ square feet respectively. Undoubtedly, the size of these displays and the high percentage of gross revenues commanded by the common carriers have been extremely important to the State legislatures in granting this exemption. Considerable importance should be attached to the fact that the various States which have enacted State legislation on billboards have expressly exempted advertising displays on properties of common carriers. It seems clear that this State legislative history should be followed and that a similar exemption should be included in the revenue bill of 1941 if the proposed excise tax contained in section 3269 is to become part of the Revenue Act of 1941.

VI. This excise tax, if applicable to advertising displays on properties of common carriers, will yield approximately $75,000 annually from those companies having advertising displays on properties of common carriers; the obvious small net receipts to the United States Treasury after deducting the cost of administering the tax and the inherent discrimination and unfairness of this excise tax should militate against its application to advertising displays on properties of common carriers; hence either this excise tax on outdoor advertising should not be retained as a part of the revenue bill of 1941 or an amendment should be incorporated whereunder advertising displays on properties of common carriers are expressly exempted

Accurate estimates show that there are approximately 75,000 1-, 2-, and 3-sheet displays on properties of common carriers. If the proposed excise tax on outdoor advertising is applicable to these displays on properties of common carriers, the total annual gross receipts derived from such advertising displays would, therefore, not exceed $75,000 in the aggregate. After deducting the necessary expenses of administering such an excise tax, the total net receipts to the United States Treasury would be an extremely negligible amount. It is contended that any excise tax not yielding in excess of the amount herein set forth should not be enacted into law as a part of the Federal revenue system. Particularly is this true where such an excise tax is highly discriminatory and unfair and the economic effect of the tax would be such that the properties of those affected would be confiscated and their business ruined.

We therefore respectfully submit that the revenue bill of 1941, as passed by the House of Representatives, should be amended, striking from it section 3269 which contains the excise tax on outdoor advertising or an amendment should be adopted whereunder the 1-, 2-, and 3-sheet displays on properties of common carriers are expressly exempted from the excise tax proposed by section 3269.

The CHAIRMAN. All right, sir.

Mr. WARREN. Thank you, sir.

Senator DANAHER. There is one question I would like to ask of this witness.

The CHAIRMAN. All right, Senator.

Senator DANAHER. If we have the right to say, by way of regulation, that we should have an imposition of a tax on a franchise, the doing of business by outdoor advertising companies, why cannot we also say where gasoline stations will be located, or anything else on the highway, by levying a tax on the ground they are obnoxiously situated?

Mr. WARREN. I do not see why you cannot, as long as they are lessors, following out the theory of this bill.

Senator DAVIS. Would some of the signs on the gasoline stations be classed as outdoor advertising?

Mr. WARREN. They would be so classed under section 3269 unless they are owned and maintained by the proprietors of the gasoline filling stations rather than by someone else as a lessor.

Senator DANAHER. If I have a corner lot and on my building I put a billboard and put some advertising on it, I would be exempt from this bill?

Mr. WARREN. That is right, Senator. Whereas if one of the advertising companies acted as a lessor, they would be required to pay the tax.

Senator DANAHER. If you would like to submit a memorandum on the question I have put to you, as to the right of the Federal Government to set up this kind of a tax, I would be glad to have you do so.

Mr. WARREN. We will furnish that to you in the next couple of days. Would that be plenty of time?

Senator DANAHER. Yes.

Mr. WARREN. Thank you.

(The memorandum referred to appears on p. 1524.)

The CHAIRMAN. There will be inserted in the record a brief statement by Mr. Myles Standish, of Providence, R. I.

(The statement by Mr. Standish is as follows:)

To the average American, the meaning of democracy as a definition of the American way of life is essentially economic rather than political.

Of all the freedoms which make up the American way of life, that which is most highly prized and will be most fiercely defended, is the freedom of the individual to shape his own destiny by exercising his initiative and enterprise to sell his services to society for the purpose of earning a living.

The right of the individual to freely communicate to the public information concerning the goods or services he produces or sells is an integral and inseparable part of that freedom, for without it, economic independence, which is the very essence of our liberty, would be impossible of achievement.

All other civil liberties are essentially safeguards to this one fundamental right—the right to live as a free man economically as well as politically.

Advertising, as we know it today, is simply the old right of word-of-mouth communication streamlined, amplified and mechanized to match the needs and

techniques of a mechanized mass production and mass distribution economy. It is universally used by large and small, in one form or another, and universally depended upon as a vital and irreplaceable means of communication between producer and consumer. Without the services of advertising, mass production—distribution and selling could not continue to exist.

Therefore, the proposal of the Congress to tax advertising is, in fact, for the first time, an assertion by the peoples' elected representatives of the right to control, restrict, or eventually even abolish, through increasingly onerous application of the principle inherent in the right to tax, that freedom of speech or communication upon which their constituents depend for their very existence as a free people.

To assert that the constitutional guaranty of freedom of speech is confined to the expression or dissemination of political, religious, or social information, conviction and opinion, and does not extend to the right to disseminate commercial information essential to economic survival, is to assert that the outward forms and appearances of freedom are more important than freedom itself. It is an obvious observation that the four freedoms are empty figures of speech to those economically dependent upon favor or patronage.

If, as John Marshall laid down, the right to tax is the right to destroy, the establishment of the principle of imposing taxation upon certain methods of advertising, and the exception of other methods of advertising from the effects and burdens of such taxation, upon no apparent basis of reason whatever, is plainly discriminatory and constitutes a denial to great numbers of citizens of the equal protection of the law.

Legislation which discriminates against one class or body of citizens and confers privileges and advantages upon another can hardly be seriously defended as just.

Obviously, the problem resolves itself into a question of the advisability of taxing either all advertising or none, unless we are to embark upon a system of legislation by whim and caprice.

Regardless of the justice or legality of the proposed tax, we submit it is practically inadvisable and undesirable for two fundamental reasons.

1. As a revenue measure, it defeats its own purpose, because it will decrease rather than increase tax revenue. Advertising, like a tree which recurrently bears fruit, is a productive force or process which cannot itself be crippled or destroyed without reducing or destroying its products. National income, which is the product of advertising, is the sole source of defense revenue. Unnecessary restriction upon nondefense industry and business will decrease taxable income and profits and reduce revenue for defense efforts.

2. As social legislation it is in itself an attack upon and not a defense of democracy, and destroys the system it purports to defend.

The very essence of the morale of our national defense is the determination of the American people to protect, maintain, and perpetuate the American way of life as it is expressed in our system of free enterprise and guaranteed by freedom of speech and freedom of the press. The proposed establishment of the right to deny to American citizens free access to customary means of communication adequate and necessary to the preservation of that system constitutes in itself an abridgement and opens the way for the destruction of those very rights and institutions for the supposed defense of which the tax is levied.

The argument that the best way to defend our institutions and rights is to surrender them without a struggle, is like maintaining that the best way to preserve life is to commit suicide.

The advertising industry neither claims nor wishes any exemption from carrying its full and equitable share of the tax burden. It is only when it is singled out for special discriminatory and perilous legislative action that threatens, not its profits, but its very right to existence, that it feels compelled to vigorously protest.

The CHAIRMAN. Mr. Peters.

Mr. NIEMEYER. I would like to take Mr. Peters' place.

STATEMENT OF G. H. NIEMEYER, NEW YORK, N. Y., CHAIRMAN, JEWELERS TAX COMMITTEE

The CHAIRMAN. What is your name?

Mr. NIEMEYER. My name is Niemeyer. I am the following witness. Mr. Peters has asked me to take his place.

The CHAIRMAN. He is not here?

Mr. NIEMEYER. He is here, but he has asked me to take his place.

The CHAIRMAN. I see several witnesses here on the jewelry tax.

Mr. NIEMEYER. Yes.

The CHAIRMAN. How many will be consolidated?

Mr. NIEMEYER. I really do not know. Some of them represent other organizations which are independent of this group.

Senator WALSH. You are Mr. Niemeyer?

Mr. NIEMEYER. That is my name, Senator.

The CHAIRMAN. How long will you use?

Mr. NIEMEYER. Less than 5 minutes, sir.

The CHAIRMAN. You may proceed.

Mr. NIEMEYER. Thank you. Mr. Chairman, my name is G. H. Niemeyer. My address is 82 Fulton Street, New York City, and I am in the precious-metal business. It was my pleasure to have been a member of the Jewelers Tax Committee under the Revenue Act of 1918. I served as chairman of the Jewelers Tax Committee under the act of 1932, and I am serving in a similar capacity at the present time. My appearance is voluntary, without compensation, nor have I any direct personal interest in the outcome. It is my privilege to speak for the following trade organizations:

American National Retail Jewelers Association, which has over 3,200 members and 35 State retail jewelers associations.
American Jeweled Watch Association.
American Jewelers Protective Association.
American Watch Assemblers Association.
Chicago Jewelers Association.
Gem & Pearl Dealers Association.
Jewelry Crafts Association.
Jewelers Vigilance Committee.
National Wholesale Jewelers Association.
New England Manufacturing Jewelers & Silversmiths Association.
Platinumsmiths' Association.
Sterling Silversmiths Guild of America.

This industry is made up of patriotic citizens who are willing and ready to bear their fair share of any tax obligation.

We endorse the principle of a retail excise tax applied to our specific industry as proposed by the United States Treasury Department and passed by the House of Representatives. The fundamental reasons for our support of this principle are well expressed in the report of Hon Robert. L. Doughton, chairman of the House Ways and Means Committee, which accompanied the Revenue Act of 1941 and reads as follows:

Retailers' excise taxes.—The bill imposes a tax of 10 percent upon the retail sale of jewelry, furs, and toilet preparations. The tax is placed upon the retail sale rather than the manufacturer's or importer's sale because of administrative and equitable considerations. Manufacturers' excise taxes upon these articles have been imposed by the Federal Government in the past. Such a tax upon toilet preparations is, in fact, imposed by existing law. Experience has proven, however, that under such taxes evasion is substantial and inequitable competitive situations are created.

In view of these considerations, the House Committee on Ways and Means is convinced of the desirability of placing these taxes upon the retail sale.

We do, however, strongly protest against the proposed tax rate of 10 percent. We believe this rate to be grossly discriminatory. A 10-percent tax at the point of retail sale is equivalent to about a 20-percent tax on the manufacturer, importer, and producer. The products against which our industry must compete, such as automobiles, radios, electrical appliances musical instruments, and so forth, are called upon to pay 10 percent or less on the manufacturer's price, and certain other comparable items are not taxed at all. We feel sure that the Congress does not intend to discriminate so unfairly against our industry.

It is our belief that a tax rate of 10 percent will seriously affect sales volume to a point where very little more revenue would be raised than if the rate were 5 percent.

Income taxes and social changes have affected our business most seriously during the past 10 years. The Revenue Act of 1941 will still further restrict our economic opportunity.

A 10-percent tax on jewelry is so high that, in our opinion, it will encourage avoidance and even evasion of the tax liability, particularly in the sale of higher-priced items.

During the World War we paid a retail excise tax of 5 percent under the Revenue Act of 1918. This raised between $20,000,000 and $25,000,000 a year in revenue. Under present conditions the proposed bill should, in our opinion, raise $30,000,000 a year or more at a 5-percent rate.

We do not believe that this relatively small industry which has had to struggle so hard to meet the social and economic changes which are taking place and which, as an industry, interferes to such a very limited extent with defense production, should be asked to contribute so disproportionately and unfairly.

We offer to patriotically bear our share of any tax burden. All we ask is your consideration in a spirit of fairness and justice.

Senator VANDENBERG. How would you feel about substituting a small manufacturers' sales tax for all of these excise taxes?

Mr. NIEMEYER. We prefer not to have a manufacturers' excise tax on the jewelry trade, because there are certain industries, like the jewelry industry, which permit further manufacture; and, under the 1932 law—which is a manufacturers' tax law—every retail jeweler, almost every retail jeweler in the country was a manufacturer, and had a tax obligation which was paid sometimes, and sometimes not, I am sorry to say.

The CHAIRMAN. Well, you are speaking now, Mr. Niemeyer, as a manufacturer, rather than a retailer?

Mr. NIEMEYER. I am not a manufacturer, nor a retailer, I am one of those fellows in the trade who sticks his neck out, if you know what I mean. I have been in this business as chairman of the vigilance committee, which seeks to maintain fair competition within the trade and keep the jewelers and their reputation safe from those who would violate it by violating the law and regulations of the Government.

The CHAIRMAN. Are you equally concerned on behalf of the retailer as on behalf of the manufacturer?

Mr. NIEMEYER. I am appearing for both, sir.

The CHAIRMAN. You appeared before the House Ways and Means Committee?

Mr. NIEMEYER. I did, sir.

The CHAIRMAN. I read your testimony there, and I noted in your testimony before the Ways and Means Committee the statement that you thought quite a number of the retailers preferred this retail tax.

Mr. NIEMEYER. They certainly do, Mr. Chairman. The very fact that I represent 35 of the State retail-jewelers' organizations, I should say was ample evidence of that fact.

Senator WALSH. But they do not want more than 5 percent.

Mr. NIEMEYER. They do not want more than 5 percent, as you have possibly heard.

Senator WALSH. Has there ever been a tax of more than 5 percent on jewelry?

Mr. NIEMEYER. There was a 10-percent manufacturers' tax under the 1932 law; yes.

Senator WALSH. How long was that in operation?

Mr. NIEMEYER. That was in operation from 1932 to 1936, and the largest amount that was raised by that tax—which is very important in the consideration of this matter—was $4,000,000 in 1933.

Senator WALSH. On 10 percent?

Mr. NIEMEYER. On a 10-percent manufacturers' excise tax; and the industry is presumed to have done a business of between $225,000,000 and $250,000,000.

The CHAIRMAN. Has the retailer ever been taxed?

Mr. NIEMEYER. The retailer was taxed during the World War.

The CHAIRMAN. How did he come out there?

Mr. NIEMEYER. The tax was 5 percent; and, as I have indicated in my testimony, that raised between $20,000,000 and $25,000,000 year after year until they began to make some exemptions, and then it was lessened.

Senator LA FOLLETTE. Mr. Niemeyer, why has it proven so difficult to collect this tax in this particular industry?

Mr. NIEMEYER. Because the retailer becomes a manufacturer, and the importing situation is very difficult. For example, diamonds are very difficult for any man to identify as taxable goods. An importer's diamond was taxable and a man who did not import a diamond, who got it second-hand, if you please, his diamond was not taxable. You would have a diamond that might be worth $500 in one case, that was taxable, that had a 10-percent tax on it, and a diamond competing with it that was not taxable. It was very difficult for the Internal Revenue Department to put their fingers on the tax obligation and on the value.

Senator WALSH. That is because of smuggling?

Mr. NIEMEYER. No; not because of smuggling. Smuggling has nothing to do with it, sir. Here is a dealer who has two kinds of diamonds in his place, one that he imported himself and another that he bought in the trade. In that connection I might say, also, that at the moment this diamond situation is more chaotic than ever, because we have literally millions and tens of millions of dollars' worth of refugee diamonds in New York now, held by people that the industry does not even know about, and they are being sold in the regular markets.

Senator WALSH. There is no way of checking up on them?

Mr. NIEMEYER. There is no way of checking up on them. We have tried to help the Department, but it is pretty difficult.

We also protest against the effect of the retroactive provision of section 2405, line 25 and 26, which proposes a tax on conditional or installment sales made since July 1, 1941, when charge-account sales collectible at some indefinite future date are not affected. It certainly does not seem fair or reasonable to penalize the buyer or seller concerned in such installment transactions when no penalty of this character or extent was contemplated or provided for at the time the sale was made.

We respectfully suggest the elimination of the words in lines 12 and 13 of section 2400 on page 76 of H. R. 5417 reading "gold, gold-plated, silver, silver-plated, or sterling flatware or hollow ware." It is our impression that these words have the effect of limiting rather than extending the coverage intended, as we believe the items stipulated separately are already covered by the previously stated provisions in lines 9, 10, and 11 of section 2400 which read "articles made of, or ornamented, mounted, or fitted with precious metals or imitations thereof."

Thank you, sir.

The CHAIRMAN. The committee will be obliged to recess at this time, because it is desired to fix a closing date for public hearings on this bill, if we can do so this morning; and, since the Senate will be in session this afternoon, we will ask the witnesses, who were scheduled, to appear before the committee in the Military Affairs Committee room on the floor of the Senate Chamber in the Capitol at 1:30.

You may be excused until 1:30 and we will ask you to appear in the Capitol, in the Military Affairs Committee room, this afternoon.

(Whereupon, at the hour of 11:45 a. m. the committee recessed until 1:30 p. m. of the same day.)

AFTERNOON SESSION

(Pursuant to adjournment for the noon recess, the committee reconvened at 1:30 p. m.)

The CHAIRMAN. The hour set for the opening of the hearing this afternoon having arrived, we will proceed. From time to time the Senators will come in when it is possible for them to do so.

Mr. Wagner, you say you are substituting for Mr. Peters?

Mr. WAGNER. Yes.

The CHAIRMAN. And Mr. Peters gave way for Mr. Neimeyer this morning, that is, agreed for Mr. Neimeyer to precede him?

Mr. WAGNER. Yes.

The CHAIRMAN. You may proceed. You appear on behalf of the retail trade?

Mr. WAGNER. Yes; I am addressing myself from the standpoint of the retailer.

The CHAIRMAN. Proceed.

STATEMENT OF WILLIAM WAGNER, NEW YORK, N. Y., EXECUTIVE SECRETARY, ASSOCIATED CREDIT JEWELERS OF NEW YORK AND NEW JERSEY, INC.

Mr. WAGNER. My name is William Wagner. I am executive secretary, Associated Credit Jewelers of New York and New Jersey, Inc. I want to read first a very brief statement on behalf of Mr. Phineas Peters, chairman, executive board of Retail Jewelers Associations of Greater New York, Inc., a group which covers all of cash jewelers' associations in New York, or a large portion of them.

STATEMENT OF PHINEAS PETERS, CHAIRMAN, EXECUTIVE BOARD OF RETAIL JEWELERS ASSOCIATIONS OF GREATER NEW YORK, INC.

This statement is submitted to you in behalf of 265 small retail jewelry store owners in Greater New York, who comprise the membership of the incorporated association of which I am chairman.

We have feared from the very inception that the defense program would hit small business harder than any other type of free enterprise prevalent in the United States. While none of the retail merchants for whom I speak has welcomed this idea, all of us realized that some sacrifice of the old order of things would have to be undergone in a period of national emergency. We realized, too, that some small businesses would not survive.

It is, however, fair and appropriate that this committee should have a full and complete understanding of the effect that the proposed Revenue Revision Act of 1941, as passed by the House of Representatives, will have upon small retail jewelry merchants. The 10 percent tax on retail jewelry sales and related items, compared with the rates imposed on radios, phonographs, automobiles, cameras, and other items that compete with jewelry for the consumer dollar, is out of proportion. It can readily be seen that the taxes on these other items are considerably less, thus making the purchase of jewelry less attractive. In addition, the industries enumerated consume materials needed for defense production, whereas the manufacture of jewelry uses mainly precious metals which are not needed for defense.

High living costs and the already increased income tax to be paid by the small taxpayer will reduce the consumer's power to buy jewelry in any shape or form or at any price. The consumer's dollar, therefore, will fall to lines other than jewelry—lines that will conflict probably with the material and manpower needed for defense production. Less consumer money spent in jewelry stores is sure to cause a wave of jewelry failures to sweep the country, a natural result of which will be to substantially reduce the Treasury's anticipated tax yield from the jewelry industry.

In addition, this will make the unemployment situation more acute, both as to business owners, their families and employees. This unemployment also will reach back and be reflected in factories and other sources supplying jewelers.

We do not seek an advantage over any other industry. On the contrary, we reiterate with considerable force the jewelry industry's desire to do its share. What we do feel, though, is that if the proposed tax on jewelry sold at retail were reduced from 10 to 5 percent, that part of the industry now faced with disaster would be able to survive and contribute its full share to the national defense, both financially, and spiritually.

Respectfully submitted.

PHINEAS PETERS.

Now, gentlemen, I would like to present my statement to you, as the executive secretary, Associated Credit Jewelers of New York and New Jersey, Inc., on behalf of the members of the association, who sell about one-tenth of all jewelry and allied merchandise sold by all retail jewelry stores of the United States and about one-fourth of all jewelry and allied merchandise sold by jewelry stores on installments.

1. A 10-percent tax on retail jewelry sales will decrease sales volume and cause business dislocations and unemployment. It likely will produce less revenue than would a lower rate.

2. Taxing retail jewelry sales 10 percent is out of all proportions to levies laid on other lines, some of which are material needed for defense and compete actively with jewelry for the same consumer dollar.

3. We urge a 5-percent tax on jewelry sales for consumption and use. We believe the jewelry business can manage such a levy without too much hardship and that it will do away with the injustice and unfairness inherent in the proposed 10-percent levy. A 5-percent levy can be collected without the complications that are bound to result from a tax on sales by manufacturers and importers which would cause tax avoidance and bring undesirable changes in the distribution of jewelry products.

4. Section 2405 of the pending revenue bill of 1941 provides for a 10-percent retroactive tax on additional jewelry sales. Such a levy, in practice, amount to a tax on jewelers' working capital. Jewelers have made no provision whatever for payment of a tax on conditional sales made from July 1, 1941, to date and are at a loss to find a practicable way to make provision for such a levy before the tax law actually goes into effect.

5. A retroactive tax on conditional jewelry sales would take several million dollars out of retail jewelers' businesses—from the smallest to the largest. Most assuredly your committee knows that nowadays virtually all retail jewelers sell on installments, and, therefore, the whole jewelry structure would be harmed by a retroactive levy on installment sales or, as has been said already, a tax on jewelers' working capital.

6. Taking several million dollars from the working capital of the retailers of an industry that has been none too prosperous for a number of years could and undoubtedly would result in nonpayment of debts owed jewelry manufacturers and wholesalers and thus result in far-reaching business dislocations and more unemployment, which, in turn, would result in decreases in revenues for defense purposes.

7. The revenue that could be derived from a retroactive tax on conditional jewelry sales unquestionably would be offset, probably several times over, by the losses that would result from depriving the jewelry industry of a substantial part of its necessary working capital.

Now, in addition to that, I have filed with the clerk a very brief statement on behalf of the Retail Jewelers of Westechester County, which I will not take the time to read because it is repetitious; however, I should like to have it in the record.

The CHAIRMAN. The reporter will put it in the record.

(The statement referred to is as follows:)

EXCISE TAX ON RETAIL JEWELRY SALES

This statement is presented by Victor Ross, retail jeweler, of 324 North Avenue, New Rochelle, N. Y., on behalf of the members of the Westchester Jewelers' Association. The membership is comprised of about 90 retail jewelers, all of them, comparatively speaking, small business men. I am presenting this statement as the vice president and acting president of the association.

The jewelers for whom I speak do a limited volume of business annually. Most of their jewelry sales are to the residents of their respective communities who are salaried persons working in New York City.

If retail jewelers of Westchester County must assume responsibility for a 10-percent tax on their retail sales, they will have their businesses hurt in two ways. First, the tax will discourage jewelry buying, because as a rule neither the jewelers nor their customers can afford to pay the extra money called for by such a high tax.

Second, a 10-percent tax will cause the residents of Westchester County to look for jewelry bargains elsewhere and even though they will have to pay the tax, no matter where they buy, many will not buy from Westchester County jewelers as a result of their shopping around.

We also fear that the money that Westchester County residents have been spending with retail jewelers will go into other lines of goods on which the tax is not so high. The 10-percent levy places jewelers at an unfair disadvantage in competing for the patronage of our own people. It will penalize jewelry buyers unduly.

Jewelers of Westchester County favor a reasonable tax on retail jewelry sales. They are opposed to a tax on sales by manufacturers and importers because collection of such a tax is impracticable and a levy of that kind will prove against the best interests of the Government and the jewelry industry.

We favor a tax at the point of retail sale with no exemptions of any kind.

Respectfully submitted.

VICTOR ROSS,
Vice President and Acting President.

The CHAIRMAN. Is it your view that the tax is all right, imposed on the retailer rather than the manufacturer?

Mr. WAGNER. We favor a 5-percent levy. We would like a lower than a 10-percent levy, but are entirely satisfied with a 5-percent levy on retail sales, and feel a tax levied in any other way is not practicable.

The CHAIRMAN. Those are your views?

Mr. WAGNER. Those are my views, and also the views of the Westchester Association, which I represent.

The CHAIRMAN. Thank you, Mr. Wagner.

Mr. Roessler.

STATEMENT OF RALPH ROESSLER, MARION, IND., PRESIDENT OF THE NATIONAL ASSOCIATION OF CREDIT JEWELERS

The CHAIRMAN. Will you give your full name to the reporter?

Mr. ROESSLER. My name is Ralph Roessler, of Marion, Ind.

The CHAIRMAN. And you are appearing here on the jewelry tax?

Mr. ROESSLER. I am appearing on the jewelry tax.

The CHAIRMAN. Yes. You may proceed.

Mr. ROESSLER. Mr. Chairman, and gentlemen of the committee: My name is Ralph Roessler, of Marion, Ind. I am engaged in the retail jewelry business, and have been so engaged during my entire business career. I am president of the National Association of Credit Jewelers, 31 North State Street, Chicago, Ill. This association has a paying membership of over 700 retail jewelers engaged in the installment and credit sale of jewelry in the United States. It is estimated that this membership sells approximately 55 percent of all jewelry sold in this country on a credit basis.

I believe from the evidence which I shall offer to the committee that it is fair to state that the views which I am about to express are those of the overwhelming majority of retail jewelers of this country.

We are not here to oppose a tax on jewelry. It is our desire to offer our cooperation to the Government in these days. We regard it a duty to our industry to bear its fair share of taxes to aid in the national defense.

Senator DAVIS. When you say they are not here to oppose the tax, you mean the excise tax?

Mr. ROESSLER. I am speaking of the excise tax; yes. With that thought in mind, I wish to present our views as to the most practical and economical method of imposing and collecting an excise tax if you, in your wisdom, find it necessary to impose that tax. We regret that it has become necessary for us to part company with the manufacturers and those whom they represented before this committee. We are, however, doing so with the firm conviction that our plan is to the best interest of the Government, the consumer, the retailer, and the industry generally. There can be no question but that sacrifices must be made, and we are willing to make them. However, in the imposition of an excise tax on a special commodity it is of primary importance that it be considered in connection with the many other taxes which the industry must bear as well as those which the consumer must also bear.

In the Revenue Act of 1932, section 605, the Congress imposed a 10-percent tax on the manufacturer, producer, and importer of jewelry. The administration of that section became complicated and difficult by reason of the fact that the Treasury Department promulgated regulations under which it was determined that any jeweler, retailer, or otherwise, who assembled two or more completely finished component parts of jewelry was a manufacturer or producer and was consequently subjected to the payment of the tax. That ruling resulted in great confusion in the industry and imposed heavy administrative cost in the collection of the tax as well as heavy burdens upon retailers in attempting to comply with that ruling. The difficulties which arose are only too well known to the Treasury Department as

well as to the industry. Finally, in 1936, the Congress repealed section 605 of the 1932 act.

And I may inject there that the reason for making that statement is the many difficulties which developed when the Government was forced to go into retail stores to make their collections.

It would not be possible for us to even approximate the overhead cost to the Government of properly administering and enforcing an excise tax on the retail sales of jewelry. We do believe that it would be exorbitant and entirely out of line with the amount to be collected. In that connection, may we suggest to you the many outlets for the sale of jewelry at retail that may be classified somewhat as follows:

1. Jewelry stores.
2. Department stores.
3. Specialty and novelty stores.
4. Millinery stores.
5. Dress shops and manufacturers of dresses.
6. Drug stores.
7. 5- and 10-cent stores.
8. Itinerant jewelers.
9. Company stores.
10. Army and Navy post exchanges.
11. Country stores.
12. Purchasing agents in industrial plants.
13. Clothing and haberdashery stores.
14. Catalog and mail-order houses.
15. Antique stores.
16. Shoe stores.
17. Watch-repair shops.

And, I might add, many others.

According to a release from the Department of Commerce, dated February 14, 1941, there were 14,559 jewelry stores; 4,074 department stores; 57,903 drug stores; 16,946 variety stores, or a total of 93,482 stores in this group in the United States, all of which most likely sell some class of jewelry. It is of course known to this committee that the other retail outlets which I have mentioned number many, many thousands, most all of which sell jewelry of some description at retail.

Since I appeared before the Ways and Means Committee we have had further investigation, and find that there are over 300,000 outlets for jewelry at retail.

If this tax is imposed on the retail sales price it will be necessary for that entire number to make monthly returns and pay the tax. Assuming that our figure of 300,000 outlets for retail jewelry is correct, that means there will be 3,600,000 returns annually. It will also be necessary for all of them to be checked and investigated, and after the returns are in their accuracy must be determined by the Government. Assuming that the cost of examining and auditing such returns is approximately $1.50, we arrive at a figure of approximately $5,400,000 annually as an overhead expenditure in that regard. Obviously it would take an army of employees to properly and effectively administer and enforce such a tax provision.

As against this picture, we have, according to a release from the Department of Commerce dated December 28, 1940, 968 jewelry manufacturers of precious metals, and 289 manufacturers of costume and novelty jewelry, or a total of 1,257 jewelry manufacturers.

This number represents approximately the sources from which the Government would collect the tax if it is placed upon the manufacturer, producer, or importer. It admits of no doubt that it is easier and by comparison far more economical to collect the tax from manufacturers, most of whom are located in a given area, than to collect it from the same number of retailers scattered in most every city, town, and hamlet in the country.

These figures show that there are 1,257 manufacturers of jewelry, well known and definitely located, as against at least 300,000 retail outlets for jewelry scattered throughout the country. It is therefore needless to add that under such a state of facts, it is far more feasible to impose and collect the tax from the manufacturers.

It is our considered opinion that a tax on the retailers of jewelry will substantially reduce their volume of business. In many instances the burden would be so heavy upon small jewelers as to very likely put them out of business. A fact to support this argument arises by virtue of a situation where a large retail jeweler is in competition with a smaller retail jeweler. The large retail jeweler may absorb a portion or all of this tax, whereas if a small retail jeweler should attempt to thus absorb the tax it would be ruinous to him. Therefore, a tax which is optional of passing on the consumer rather than mandatorially collectible from the consumer becomes a serious competitive weapon. This unfair and inequitable situation cannot arise if you impose the tax upon the manufacturer, producer, or importer. Every retailer who purchases from such manufacturer, producer, or importer is then on an equal competitive basis.

Volume of business.—The figures which we are giving you do not accurately reflect the sale of jewelry at retail by jewelry stores or other retail outlets of jewelry for the reason that such retailers sell much merchandise other than jewelry. In a release by the Department of Commerce, dated February 14, 1941, it is reported that the volume of business done by retail jewelry stores amounted to $361,595,000 for the year 1939. From this volume must be deducted other items sold by retail jewelers, such as radios, china dinnerware, gift novelties, and so forth, the volume of which we do not have.

In the same release from the Department of Commerce, it is reported that for the year 1939 variety stores did a volume of business of $976,801,000; drug stores, $1,562,502,000; and department stores, $3,974,998,000. There is no break-down, and of course it is impossible to determine from these figures the amount of jewelry sold by these stores. Nevertheless, if the tax is imposed upon retailers, it is necessary that some method be devised by which all these outlets for jewelry must make returns, pay the tax, and be properly supervised by the Government. That makes obvious to you the great problem which would confront the Government in properly administering and enforcing such a tax.

Amount of tax.—It has been suggested that a 10-percent tax on the retail sales price of jewelry will result in twice as much revenue to the Government as a 10-percent tax on the manufacturers sales price of jewelry. We submit that such a statement cannot be supported by facts. This statement does not take into consideration

the huge overhead cost of collection by the Government from approximately 300,000 retail sources scattered throughout the United States as compared with approximately 1,300 manufacturers, producers, and importers located in a fairly well-defined area. As heretofore stated, the cost to the Government of collecting from 300,000 sources would be approximately $1.50 per return, or approximately $5,400,000. As against this huge cost we find that there would be approximately 15,600 returns from manufacturers at an overhead cost of approximately $23,400 annually. Again, it is not possible for me to estimate the percentage of retail outets for jewelry which would never be reached by the Government. You may rest assured that it would have quite some bearing upon the revenue. However, there would be no reason whatever for the Government not collecting from 100 percent of the manufacturers, producers, and importers.

By adding to these facts the recognized view of the retail jewelers that their volume of business would be substantially reduced, we cannot but arrive at the conclusion that the 10-percent tax on the manufacturers would, in the long run, result in a net return to the Government approximating that which would result by a 10-percent tax on the retail sale of jewelry. We also direct your attention to the fact that many outlets for sale of jewelry at retail have no accurate bookkeeping system, and although we make no charge or allegations, experience has proven to the Government as well as to us that a very considerable amount of taxes would not and could not be collected from retailers because of the lack of proper records as well as deliberate evasions by the unscrupulous. These facts alone should be convincing to you that by placing this tax upon the manufacturer the Government will receive its revenue expeditiously, economically, and in full. It would not disrupt the industry and we believe that it is a burden which should be borne by us during this period of emergency. We, of course, pay the tax even though it is imposed on the manufacturer. We believe that the manufacturers, as well as every other part of our industry, should assume its fair and proportionate obligation to our Government. If this tax is imposed on the manufacturers they are, in reality, only acting as a collecting agency for the Government. They should at least be willing to do that much, and frankly I do not have much patience with those who are not willing to bear this slight burden at this time.

It has been represented to the Ways and Means Committee, as well as to this committee, that the jewelers' tax committee, which has just appeared before you, represents the sentiment of the retail jewelers in presenting their argument to you. The fact is that I have in my possession, and would like to present to your committee, a great volume of letters, telegrams, and resolutions from retail jewelers, both cash and credit, throughout the United States who have taken a directly opposite position from that presented to you by the jewelers' tax committee. You have undoubtedly received such communications yourselves, and are well able to judge whether the statement I am making is correct.

We share the belief that, if you decide to impose this tax on the retailer, you should reduce it to 5 percent. A 10-percent tax would be a tremendous burden for retailers to bear. Many may be forced

to go out of business, others would barely make both ends meet, and no one would be able to make a reasonable profit on investment. The tax on jewelry during the last World War was 5 percent and we submit that such a percentage would now be fair and equitable. However, the many administrative difficulties, among our other reasons, persuade us to the firm and unshakable view that this tax should be imposed upon the manufacturer, producer, or importer.

Conclusion.—I am submitting herewith a suggested amendment to the proposed tax bill which, in my opinion, removes the difficulties of administering which prevailed under section 605 of the 1932 Revenue Act. And just there, gentlemen, in explanation of the difficulties that arose, was the fact that by the ruling of the Treasury the retail jeweler, if he moved a watch movement from one case to another, he came under that ruling a manufacturer or producer of the watch movement or watch case; also that if he set a diamond which he had in his possession for years, he became a manufacturer of the mounting, and importer and producer of the diamond. Now, we believe that that situation can be clarified in the following amendment which I will propose. You will observe that it is our suggestion that a retailer of jewelry who assembles two or more completely finished component parts of jewelry upon which a tax has been paid shall not be considered a manufacturere or producer. I believe that if you adopt such an amendment it will go a long way toward making the administration of this provision of the act comparatively easy and simple. Naturally some difficulties will arise but they will be insignificant as compared with those which will arise if the tax is imposed upon the retailer.

Our suggested amendment is as follows:

There is hereby imposed upon the following articles, sold by the manufacturer, producer, or importer, a tax equivalent to 10 per centum of the price for which so sold: All articles commonly or commercial known as jewelry, whether real or imitation; pearls, precious and semiprecious stones, and imitations thereof; articles made of or ornamented, mounted or fitted with, precious metals or imitations thereof, ivory (not including surgical instruments or eyeglasses); watches, clocks, parts for watches or clocks sold for more than 9 cents each; opera glasses; lorgnettes; marine glasses; field glasses; and binoculars. No tax shall be imposed under this section on any article used for religious purposes. A sale of any two or more of the above articles shall be considered a sale of each separately. For the purpose of this section, a retail jeweler who assembles two or more completely finished component parts of jewelry upon which the tax has been paid shall not be considered a manufacturer or producer.

In addition to this statement, gentlemen, I want to clarify one statement made by Mr. Niemeyer this morning in stating that the manufacturers' tax from 1932 to 1936 produced in the neighborhood of $4,000,000. Mr. Niemeyer forgot to state that at that time there was an exemption of $25, meaning that so far as the general retail store was concerned, practically all their merchandise was exempted from the operation of the tax. We are asking for no exemptions. We think the broader the base the better it would be.

Another thing I would like to say is that I have received some communications which I would be glad to have this committee, if they desire so to do, examine at leisure. I might indicate, from one or two of them, generally what they are.

Here is one from Paul E. Morrison, president, Retail Jewelers Association of Michigan:

Greetings to your meeting from Michigan; 850 retail jewelers who recently sat in special 1-day convention and passed resolution going on record as favoring newly proposed jewelry tax to be placed at source of manufacture. It is well recognized here that demoralization of our industry would result from any tax being placed at point of retail sale resulting in unfair competition as well as the immense cost of collection to the Government to police all retail stores.

That, gentlemen, is a State association affiliated with the American National Retail Jewelers Association.

I have another telegram, and I will only impose two or three of these on you because of the shortness of time. This is from Savannah, Ga.:

At meeting in Atlanta, Ga., jewelers expressed themselves unanimously for tax at source. Will so wire A. N. R. J. A. and copy of telegram is to be sent you. Think South Carolina will do likewise, according to Mr. Cochran.

B. I. FRIEDMAN.

And here is another:

You have unqualified support of rank and file California jewelers, for whom I am authorized to speak. Wire from Senator Downey states he will appear before committee asking change; contact him if you think advisable; supporting letters from all over State. Regards.

That is from Arthur H. Dibbern, managing director, California Retailers Jewelers Association.

Here is a resolution from the Virginia Retail Jewelers Association:

Resolved, That we, the president and the executive committee of the Virginia Retail Jewelers Association, representing the retail jewelers of Virginia, do hereby recommend that this tax be levied on the manufacturer or on the jeweler's source of supply; and be it

Resolved further, That this association is definitely opposed to a tax on retail sales, feeling that such a tax will jeopardize the volume of sales materially, thereby reducing the tax which would otherwise accrue to the Government from our industry.

Now, I could continue, but I don't wish to take any more time. I would like, however, if you care to have me do so, to file with the clerk these additional communications.

The CHAIRMAN. File them with the clerk. We will be very glad to give them consideration.

Any questions, gentlemen?

(No response.)

The CHAIRMAN. And thank you for your appearance.

And the next witness is Mr. Shipe.

STATEMENT OF A. K. SHIPE, WASHINGTON, D. C., REPRESENTING NATIONAL ASSOCIATION OF CREDIT JEWELERS

Mr. SHIPE. Mr. Chairman, I believe this matter has been covered sufficiently; and, in view of the fact that you have pronounced the policy that you do not desire to hear too many witnesses on the same subject, and in order to conserve the time of the committee, I shall decline to make any further statement.

Senator VANDENBERG. Which side of this controversy are you on?

Mr. SHIPE. I am in favor of the tax on the manufacturer. I am counsel for the National Association of Credit Jewelers.

(The following letter was ordered printed in the record:)

NATIONAL ASSOCIATION OF CREDIT JEWELERS,
CHICAGO, ILL., *August 21, 1941.*

HON. WALTER F. GEORGE,
Chairman, Senate Finance Committee,
Senate Office Building, Washington, D. C.

DEAR SIR: During the hearing accorded representatives of the jewelry industry, several statements were made by representatives of the jewelers tax committee, Mr. G. H. Niemeyer, chairman, that need clarification, and in some instances, correction. In your deliberations on the jewelry excise tax we very respectfully ask that you present this letter to your committee and, if desirable, have it made a part of your committee record.

In July 1940, in anticipation of an excise tax on the jewelry industry, a group of men met and formed what is known as the jewelers tax committee. As chairman of this committee Mr. Niemeyer appeared before the Senate Finance Committee. This committee is responsible for all the effort that has been put forth in opposition to collecting this tax from manufacturer, producer, or importer. In order that you may know exactly for whom Mr. Niemeyer was testifying we submit for your consideration the membership of his committee and who they actually represent.

A. Blustein, wholesaler, representing National Wholesale Jewelers Association, Washington, D. C.

James B. Dickey, representing Tiffany & Co., Fifth Avenue, New York, claims to be the largest manufacturer of jewelry operating a retail store.

George P. Engelhard, representing Chicago Jewelers Association, wholesale jewelers. Publisher of trade journal, N. J., distributed free to retailers, sole revenue derived from advertising obtained from manufacturers and wholesalers.

P. M. Fahrendorf, jewelers vigilance committee. The membership of the vigilance committee is made up largely from the manufacturing and wholesale groups. Also publisher of Jewelers Circular-Keystone. Dependent upon manufacturers and wholesalers for advertising support.

Royal J. Gregg, representing New England Manufacturing Jewelers and Silversmiths Association. Also, Osty & Barton Co., jewelry manufacturers, Providence, R. I.

Walter N. Kahn, representing American Jewelers Protective Association, also L. & M. Kahn Co., wholesalers in New York.

C. M. Kendig, representing American Jeweled Watch Manufacturing Association. Also, Hamilton Watch Co., makers of watches, Lancaster, Pa

Clifford F. Lamont, representing Gem and Pearl Dealers Association, importers and wholesalers of pearls. John Lamont & Son, New York.

Oscar M. Lazrus, representing American Watch Assemblers Association. Importers of watch movements. Also Benrus Watch Co.

William F. McChesney, representing Sterling Silver Guild of America, silverware manufacturers. Also Gorham Manufacturing Co., makers of sterling and plated silverware.

J. Mehrlust, representing Platinumsmiths Association, manufacturers of platinum jewelry. Also J. Mehrlust, New York, manufacturer.

G. H. Niemeyer, chairman, representing jewelers vigilance committee. Also Handy & Harmon, gold and silver refiners, whose product is sold largely to manufacturers, New York.

Wilson A. Streeter, representing American National Retail Jewelers Association. Also, Bailey, Banks & Biddle, large retail store in Philadelphia with manufacturing interests.

Kenneth I. Van Cott, representing jewelry publicity board. Also, exclusive Fifth Avenue Diamond Shop.

Henry W. von Unruh, representing American National Retail Jewelers Association. Retail jeweler in Cincinnati, Ohio.

Rawson L. Wood, representing Jewelry Crafts Association, manufacturers' association. Also, J. R. Wood & Sons, jewelry manufacturers and diamond importers, New York.

In a careful analysis of this committee you will note there is but one individual who actually represents the average retail jeweler, Mr. von Unruh, of Cincinnati. It was the decision of this group of outstanding manufacturers' representatives that the tax should be collected from the retail jeweler. This decision was made without referendum and without consulting the retailers' wishes.

You heard Mr. Niemeyer present the industry's patriotic desire to do its share in contributing to the defense fund through taxation. I quote from his testimony, "We offer to patriotically bear our share of any tax burden." He failed to tell you that it is the program of the jewelers tax committee to see that that patriotic share is borne wholly by the retailers and that his committee is now rasing an enormous sum of money throughout the country to spend in an effort to influence Congress to keep the tax on the retailer for the sole purpose of totally exempting the manufacturer, producer, and importer from any participation whatsoever in the collection of this tax.

No matter where this tax is collected, the retailed must in some manner raise the money and at best the only burden placed upon the manufacturer would be that of acting as the collecting agency for the Government. We submit the manufacturer is as much a part of the industry as the retailer, and he has an equal responsibility to the Government.

Mr. Niemeyer, in his testimony to the Finance Committee, pleaded for a reduction of the tax on the retailer from 10 to 5 percent, showing to the committee that a 10-percent tax at retail would be ruinous to the retailer, yet he has made the positive statement he would oppose a tax at source even though it meant a tax of 10 percent at retail, or, as he testified, the destruction of many retailers. Obviously, Mr. Neimeyer has but one objective, to exempt the manufacturer from having any part of this tax by placing it in its entirety upon the retailer. If this is not true, they why is the jeweyers tax committee raising such an enormous fund of money to promote their efforts? Each State has been given a quota of funds to raise, and judging from the $1,000 quota given Indiana, the total amount expected must be a very large sum. As an example I will quote from a letter received from the secretary of a State jewelers association:

"The A. N. R. J. A. tax committee at the insistence of Mr. Niemeyer has raided California in regard to the special fund you no doubt have heard about, to the extent of over $1,600. It was the worst shake-down racket I have ever heard of in the jewelry industry."

The National Association of Credit Jewelers has from the beginning represented the retail jeweler only. Many States have had special meetings on this subject at which resolutions have been drawn and sent on to your committee. This has all been voluntary work, each individual financing his own efforts, and many letters and wires you have received testify to their earnestness. We are not concerned about the large retail establishments, they can take care of themselves, but we are deeply concerned over the preservation of the smaller store which cannot successfully compete with the large institution if the payment of a tax in the retail store becomes a weapon of unfair competition.

Mr. Niemeyer made the statement that in 1932 to 1936 the largest amount raised by a manufacturers' tax was $4,000,000. He failed to state that at first every article costing $3 or less was exempted from taxation, and later everything under wholesale cost of $25 was exempted. This eliminated thousands of outlets from paying any tax, and thousands of smaller stores from paying on any but a small portion of their sales. Many manufacturers produced items around $25 cost to retailer and billed them at $24.99 to avoid payment of tax to the Government. Again, the sales volume in 1932 to 1936 was materially lower than it is now. His testimony can be completely nullified in this respect by taking Government figures as to the amount of sales by manufacturers, producers, and importers in the past 2 years and resolving that into tax production.

Mr. Niemeyer claims there will be avoidance of the tax by refugees who bring in diamonds. If it is true at the source, it will be equally true at the outlet. If such a situation prevails it could more easily be controlled by the Government at the source than at the outlet.

There has been great confusion among the retail jewelers caused largely by propaganda sent out by the jewelers' tax committee. A few days before the jewelers' excise tax was considered by the House committee, the jewelers' tax committee sent out a broadside that if a manufacturers' tax was levied, there would be a 10-percent floor tax levied upon all merchandise in stock to be paid within 30 days. The intent of this propaganda was to frighten the retailer (for a floor tax as suggested would ruin the industry) in asking for a retail tax in preference to a floor tax.

This same confusion has been evident to your committee. After its success in having this tax imposed on the retailer in the House of Representatives, the jewelers' tax committee assumed the role of championing the cause of the retailer by asking your committee to reduce the tax from 10 to 5 percent. They then

broadcast a request for retailers to telegraph or write to you gentlemen in support of their sham effort as a supporter of the retailer. Naturally retail jewelers will wire you to that effect and many have done so. Their reason for so doing is because that very committee has been assuring them that the tax will be imposed upon them and that they very obviously would prefer the 5-percent tax rather than the 10-percent tax. But that is no indication whatever that these same jewelers do not prefer a tax collected at source.

We believe there are three patriotic duties involved in this matter:

1. The retailer's duty to raise the tax for the Government, whether jeweler, druggist, clothier, department store, dime store, or peddler.

2. The manufacturer's duty to see that the money comes from all retailers selling taxable items by issuing merchandise only to those who pay the tax.

3. The duty of Congress to see that the revenue is raised as economically and expeditiously as possible, and that the tax does not become destructive of the business which produces the revenue, thus defeating its own purpose.

We believe that the following figures will give you a substantially accurate picture of the net revenue to be derived from a 10-percent excise tax on jewelry, whether on the retailer, or the manufacturer, producer, or importer:

	Retailer	Manufacturer, producer, or importer
Volume of business	$500,000,000	$280,000,000
10 percent tax	$50,000,000	$28,000,000
Number of outlets	300,000	1,257
Number of returns annually	3,000,000	15,084
Cost of collection at $1.50 per return	$5,400,000	$22,626
Estimated loss by inability to collect, or by evasion, 15 percent	7,500,000	None
Reduction in volume of business by virtue of tax, 15 percent	7,500,000	None
Total, last 3 items	20,400,000	22,626
Net revenue	29,600,000	27,977,374

We believe that the above figures are reasonably accurate. The committee will also bear in mind that if the tax is placed upon the manufacturer the revenue is realized immediately, whereas if it is placed upon the retailer no revenue is realized until after final sale to the consumer, and in case of installment sales, on each installment when paid, the latter consisting of a very substantial volume of the retail jewelry business. Also many items of jewelry are held by retailers for a substantial length of time before sale, and in many instances no sale can be made and the items are returned to the manufacturer. In all such latter cases no revenue would be derived if this tax is imposed upon the retailer. We submit that these figures and facts indicate quite clearly that the net revenue to the Government would be substantially the same whether the tax is imposed on the manufacturer, producer, and importer, or on the retailer. If this tax is placed on the manufacturer, producer, and importer the industry will suffer less, the public will benefit, and the Government will get the revenue promptly.

We, therefore, earnestly urge that you adopt the amendment presented to your committee by us on August 14, 1941.

Respectfully yours,

RALPH ROESSLER,
President, National Association of Credit Jewelers.
A. K. SHIPE,
Attorney for National Association of Credit Jewelers.

The CHAIRMAN. Mr. Wilson A. Streeter.

STATEMENT OF WILSON A. STREETER, PHILADELPHIA, PA., CHAIRMAN, TAX COMMITTEE, AMERICAN NATIONAL RETAIL JEWELERS ASSOCIATION

Mr. STREETER. I am appearing on behalf of the jewelers in this tax.

The CHAIRMAN. Retailers or manufacturers?

Mr. STREETER. Retailers. Mr. Chairman, my name is Wilson A. Streeter, and I am president of the Bailey, Banks & Biddle Co., Philadelphia, Pa., one of America's oldest retail jewelry stores, and I am here, representing, as chairman, the tax committee of the American National Retail Jewelers Association, an organizatinon of more than 3,200 paid members, with associations in 38 States, 90 percent of whom are in favor of the contents of this brief; vice chairman of the jewelry tax committee under the Revenue Acts 1917, 1918, and 1932, and secretary of jewelers' tax committee, 1941.

According to the last census there are some fourteen-thousand-four-hundred-odd retail jewelers of all kinds, including repairers, and so forth; both the census and the National Jewelers Board of Trade state that some 8,000 of these are repairers and minor dealers who have a general sales volume of $10,000 or less, leaving about 6,400 retail jewelers—important ones.

At the hearings before the Ways and Means Committee we collaborated with Mr. G. H. Neimeyer in presenting what we believed met the wishes of our members, thus conserving the time of those hearings.

We regret exceedingly that due to a most unfortunate situation we now find that in order to properly represent our members we must present a separate statement.

The statement presented today by Mr. Neimeyer contains the considered conclusions reached by the jewelers' tax committee after careful study and conferences, and we approve same.

The law, section 2400, as printed by the Ways and Means Committee imposes a tax of 10 percent at the point of retail sale as recommended by the United States Treasury Department, and Mr. Doughton, on page 33 of his report, clearly outlines the reasons this tax was imposed in that manner, and not as nearly all other taxes, at the point where the goods were sold by the manufacturer, importer, and producer.

I am not going to repeat that statement, because it has been read to you once today.

Senator GUFFEY. But that which you are omitting, you want to have in the record?

Mr. STREETER. Yes.

The CHAIRMAN. It will be included in the record.

(The statement submitted by Mr. Streeter is as follows:)

This bill imposes a tax of 10 percent upon the retail sale of jewelry, furs, and toilet preparations. The tax is placed on the retail sale rather than the manufacturers' or importers' sale, because of administrative and equitable considerations. Manufacturers' excise taxes upon these articles have been imposed by the Federal Government in the past. Experience has proven, however, that under such taxes evasion is substantial, and inequitable situations are created. In view of these considerations your committee is convinced of the desirability of placing these taxes on the retail sale.

Mr. STREETER. Under the tax law of 1917, a tax of 3 percent was imposed on the manufacturer, importer, and producer and as a revenue producer was a failure. This law contained a floor tax which was removed in the Senate.

Mr. STREETER. The War Revenue Tax Act of 1918, passed in February 1919, imposed a tax of 5 percent on the retail price, using much the same language as section 2400, Revenue Act, 1941.

This tax produced some $25,000,000 in the earlier years, until exemptions were passed by law.

In May 1932 a new excise-tax law imposed a tax of 10 percent on the manufacturer, importer, and producer, estimated to produce at least $15,000,000 revenue. When we appeared before your committee we stated that law would not produce $5,000,000.

The law contained an exemption of $3 and produced about $4,000,000 the first year and an increased exemption of $25 reduced the yield $2,000,000 and $3,000,000, and the law was repealed June 6, 1936.

The records of the Internal Revenue Department will indicate that this tax did not produce sufficient revenue to make it of value. Aside from this it created havoc among the various branches of the jewelry industry, creating conditions that could not be controlled because of elements which entered into all branches, such as curbstone brokers, second-hand goods, and so forth. These are conditions referred to by Mr. Doughton.

Because of the fact much confusion will be caused we suggest elimination of the following from the text of section 2400, lines 12 and 13, "Gold, gold-plated, silver, silver-plated or sterling silver flat ware and hollow ware." This is a duplication and limitation of the scope of the act as to "precious metals and imitations thereof," lines 10 and 11.

We believe that when it is necessary to secure a revenue for specific purposes the most effective and remunerative plan is a Federal sales tax.

We believe that Congress should meet the issue of the present situation by broadening the base of the income taxes rather than assess all income taxes on 5 percent of the American people. We further believe the stiff graduation in surtax rates between $2,000 and $10,000 will prove a very real hardship on this group, forcing serious financial loss and handicap, hence producing diminishing returns.

Secretary Morgenthau suggested a saving of $1,000,000,000 in ordinary Federal expenses; he also stated recently the necessity of securing $2,000,000,000 additional revenue. We commend for your attention the statement of Dr. George S. Benson, the president of a college in Arkansas, who outlined to the Ways and Means Committee in detail how a saving in excess of this amount could be accomplished. (See p. 1198, vol. 2, of House hearings.)

The man on the street today is saying, "I don't mind being taxed for defense, but why does not your Federal Government do what every sane businessman does—reduce other running expenses?"

Senator VANDENBERG. The Federal Government is only partially sane. If you sat around here very long you would not be very long either.

Mr. STREETER. While we as jewelers do not believe in the imposition of excise taxes on any specific industry, we do believe that if such taxes are imposed all industries should be taxed on the same basis.

The 1941 tax law imposes taxes at the rate of 10 percent on numerous lines on the manufacturer, importer, and producer, and then it imposes a tax of 10 percent at retail on three selected industries; as jewelers we believe this to be an unjust discrimination against these industries. It is almost double the other levies. It was first

estimated this tax would produce $29,000,000—revised, I believe, three times until it is now $56,000,000.

Gentlemen, I wish to impress you with the fact that this 10-percent rate on retail sale will defeat the law as an income producer.

Unfortunately, there are elements in our country outside the legitimate jewelry store who, like in 1932, will defeat this law, and these people have never been reached by our Federal agents. There are millions in gems in the hands of refugees, and others who will be the sellers of important jewelry to the consumer, collect no sales tax and pay no revenue to the Government. Ten percent is such a high rate it will be an incentive to take risks, risks which will deprive the retailer of an opportunity to make sizable sales; then, too, there are many millions of dollars worth of second-hand gems hanging over the market which will reach the consumer without passing through the jewelry store.

And I might add that without ever passing through a manufacturer, importer, or producer, hence, they would never be taxed.

Senator VANDENBERG. That is going to happen anyway, regardless of what kind of rate you make.

Mr. STREETER. To some extent, but not the extent under the incentive of a 10-percent rate.

We respectfully urge you to revise this law and reduce the rate to 5 percent on final sale. You gentlemen need only to look back to 1929 when after years of pleading by the jewelers you finally reduced the tariff on cut diamonds from 20 percent to 10 percent and placed the rough on the free list. From 1913 to 1929 more diamonds were being smuggled into America than arrived through the Customs, this reduction making it unprofitable to smuggle, and changed that picture overnight.

Senator DAVIS. Have you an estimate of the amount of jewelry brought in here by refugees?

Mr. STREETER. There is no way of getting it. Nobody knows who they are. We hear of them; they come in and offer their goods. We don't deal with them, because we don't do that type of business, but they do find a great many buyers among the public generally.

Please don't impose this heavy rate of 10 percent and require the legitimate jewelers of America to face competition with these forces which will destroy them. A tax of 5 percent on the resale price will produce more revenue and at the same time permit the jeweler to earn a profit which will produce income taxes for our defense expenditures.

A tax of 10 percent will act as a deterrent to the purchase of jewelry-store wares, and we believe this also will defeat your own purpose by reducing the revenue, as well as income taxes of jewelers. Why deny those who today have some money to spend for articles they have always dreamed of owning for themselves or families as long as they do not interfere with the defense production; let them buy freely without a punitive sales tax.

Five percent is the extreme rate that can be imposed without unjustly penalizing the purchaser or creating an incentive to unfair business competitive conditions.

Before I complete the last paragraph, I want to make one comment on Mr. Roessler's testimony a minute ago. The secretary of our asso-

ciation advises me we have 600 credit jewelers in our membership. A great many of them are also members of the Retail Credit Jewelers Association. The statement has been made as to the possible amount of sales. Our association has no record, except that during the N. R. A. period it represented 85 percent of the retail jewelry sales of the country. Regardless of the suggested law which has been suggested and which would make every unfinished part of jewelry taxable when it passes through the retailer, I believe the retailer would still be liable as a producer of taxable articles.

In conclusion, in view of the fact that a large number of the members of our association sell on credit terms involving leases and conditional sales, we direct attention to a most unfair provision in section 2405, lines 23 to 26, and respectfully request the last three words on line — be deleted "July 1, 1941," and the following substituted: "the effective date of this act." Obviously it is not possible to assess taxes on merchandise sales before a law is passed and made operative. This provision is apparently an error, as it follows the language of another provision referring to articles similarly taxed under the 1940 law, whereas there is no tax on jewelry and furs at present.

Senator DAVIS. May I ask a question? Mr. Roessler, in his remarks, stated that he figures there are 300,000 outlets for retail jewelry. If that is correct, it would involve 3,600,000 returns annually at a cost of approximately $1.50 for each return. To be checked and investigated, it would cost $5,400,000, an expenditure nearly as great as the tax itself.

Mr. STREETER. All I can say to that is this: This provision for placing the tax on retail sales comes from the Treasury Department, and it was the Treasury Department which struggled for 4 solid years to make a manufacturers' tax operative on jewelry, and they failed to do so. What other reasons they had besides those indicated by Mr. Doughton I do not know.

Senator DAVIS. We cannot find places here to build buildings. If these are the facts, you would have to build a couple of new buildings to put these clerks in to check this tax alone.

Mr. STREETER. No question about that; but we didn't suggest the tax.

Senator GUFFEY. How old is your firm?

Mr. STREETER. 109 years next month.

The CHAIRMAN. Well, the first 109 years are the hardest.

Mr. STREETER. Well, they may not be if this tax is levied.

(Mr. Streeter submitted the following for the record:)

THE BAILEY, BANKS & BIDDLE CO.,
Philadelphia, Pa., August 18, 1941.

Hon. WALTER F. GEORGE,
Chairman, Senate Finance Committee,
Senate Office Building, Washington, D. C.

DEAR SENATOR GEORGE: Please permit me to express my gratitude for your courtesy at the hearing on Thursday.

When I receive a copy of the rather confusing statement presented by Mr. Roessler I desire to direct attention to some, what seemed to me to be, rather glaring errors.

Mr. Roessler stated he represented the great majority of the retailers and supported the statement by telegrams, etc. I did not feel you gentlemen would care to examine a like amount of telegrams, numbers of them reversing their former ones sent in response to 10,000 letters mailed to people who do not belong

to his association whose published list contains 468 names (41 of which are dual memberships of two concerns).

Trusting you will consider this proposed statement when you study this question, I am

Very truly yours,

WILSON A. STREETER, *President.*

AMERICAN NATIONAL RETAIL JEWELERS ASSOCIATION,
New York, N. Y., August 22, 1941.

To the MEMBERS OF THE COMMITTEE ON FINANCE,
United States Senate, Senate Office Building,
Washington, D. C.

GENTLEMEN: Supplementing the statement made before your committee, on August 14, 1941, by Mr. Wilson A. Streeter, of Philadelphia, chairman of our tax committee, I am enclosing copy of telegram sent to presidents of State associations in affiliation with the American National Retail Jewelers Association on August 2, 1941, and copies of their replies.

Faithfully yours,

AMERICAN NATIONAL RETAIL JEWELERS ASSOCIATION,
CHARLES T. EVANS, *Secretary.*

Information for Mr. G. H. Niemeyer, chairman, jewelers' tax committee, and Mr. Wilson Streeter, chairman, American National Retail Jewelers Association tax committee.

The following telegram was sent to State presidents under date of August 12, 1941:

"If the retail jewelry business is to have any chance of escaping the ruinous results of a 10-percent or higher retail tax, it is imperative that a consolidated front be presented before the Senate Finance Committee on Thursday, August 14. Every effort will be made by the jewelers' tax committee to have the rate reduced to 5 percent. Please wire us collect immediately approval on behalf of your members of this position. There will be no further opportunity to make our wishes known so we cannot overemphasize the seriousness of the situation. Urge that you also contact as many of your own members as possible asking they wire their own Senators and members Senate Finance before August 14 as requested by the American National Retail Jewelers Association.

"CHARLES T. EVANS."

To the above telegram the following replies have been received:

"We urge every effort be made by our jewelers' tax committee to impress the Senate Finance Committee that a 10-percent tax is entirely too high. A 5-percent defense tax at this time would seem fair. With an Alabama 2-percent sales tax plus the proposed 10-percent Federal tax, competitive merchandise would have a great advantage. A ruinous condition for the Alabama jewelers. The Alabama Retail Jewelers are a patriotic organization and ask only fair treatment with competitive business in these trying days.

"ALABAMA RETAIL JEWELERS ASSOCIATION,
"F. W. ANDERSON, *Secretary.*"

"At a recent board meeting of the Arkansas Retail Jewelers Association it was the unanimous opinion that we approve the efforts of the tax committee to have the suggested ruinous rates of 10 percent on retail jewelry sales reduced to 5 percent. You or the tax committee chairman have our permission to represent our State association before the Senate Finance Committee.

"ARKANSAS RETAIL JEWELERS ASSOCIATION,
"H. T. PURVIS, *President.*"

"At our last convention the Arizona Retail Jewelers Association unanimously passed a resolution to the effect that we felt we should not oppose any reasonable tax upon our industry which might assist in the defense of our Nation but further resolved that any tax over 5 percent would not only be unreasonable but also discriminatory. We trust that our national association, through its tax committee can convert the Senate Finance Committee to our viewpoint at the August 4 hearing.

"ARIZONA RETAIL JEWELERS ASSOCIATION,
"ELMER E. PRESENT, *President.*"

"California jewelers favor tax at point of sale. Ten percent will be disastrous to jewelry business, must not be over 5 percent.

"CALIFORNIA RETAIL JEWELERS ASSOCIATION,
"P. H. BOYSON, *President.*"

"As president of the Maryland-Delaware and District of Columbia Jewelers Association, I and my fellow members strongly oppose a 10-percent tax on jewelry and deem a 5-percent tax wholly adequate and producer of more revenue. A 10-percent tax will certainly reduce sales to a point where it will bring in less revenue than a 5-percent tax.

"MARYLAND DELAWARE DISTRICT OF COLUMBIA RETAIL JEWELERS ASSOCIATION,
"SYDNEY W. SELINGER, *President.*"

"Majority Florida retail jewelers favorable to 5 percent or less retail tax. Have contacted all Finance Committee Senators by wire today.

"FLORIDA RETAIL JEWELERS ASSOCIATION,
"BRUCE WATTERS, *President.*"

"The jewelers of Iowa feel that a more than 5-percent tax would be ruinous to the good of the jewelry business, and I urge you to take this to the Senate Finance Committee. We want to do all we can but do not want to be put out of business with too high a tax.

"IOWA RETAIL JEWELERS ASSOCIATION,
"GRANT W. DUDGEON, *President.*"

"Accept our approval on your stand on 5-percent tax. Kansas retail jewelers back of you fully in this matter. The majority of Kansas jewelers today also wiring Senators as individual as well as our association.

"KANSAS RETAIL JEWELERS ASSOCIATION,
"W. B. BRASFIELD, *Secretary.*"

"Wired Senator Barkley yesterday calling his attention to the hardship a 10-percent excise tax on jewelry would place on both large and small retailers, We believe 5-percent tax would produce more revenue as it would discourage evasion and bootlegging. A 10-percent tax would encourage both. In one particular store a 10-percent tax would discourage sales. During the last war we suffered by the imposition of the 5-percent tax. Jewelry does not divert defense materials and should not be paralyzed.

"KENTUCKY RETAIL JEWELERS ASSOCIATION,
"NOLTE C. AMENT, *President.*"

"Have contacted prominent jewelers—all agree 10 percent would ruin our business. Five percent we would try and work out. Remind committee this city and other cities already have 2 percent sales tax. We would be selling taxes instead of merchandise. Have contacted all Senators, Finance Committee; also other jewelers here. You can depend on our cooperation.

"LOUISIANA RETAIL JEWELERS ASSOCIATION,
"LOUIS J. BERNARD, *President.*"

"Please make 5 percent contacts. All jewelers in this section.

"MAINE RETAIL JEWELERS ASSOCIATION,
"LINDSAY G. TRASK, *President.*"

"Officers and members of Massachusetts and Rhode Island Retail Jewelers Association definitely opposed to 10-percent tax as being ruinous to jewelry industry. Bankruptcies and forced closing result as both jewelry stores are operating at a loss or at a very small margin. We authorize you to represent this organization and urge you to do everything in your power to have this tax reduced to 5 percent.

"MASSACHUSETTS-RHODE ISLAND RETAIL JEWELERS ASSOCIATION,
"FRED WIDMER, *President.*"

"Imposition of 10-percent retail jewelry tax in addition to Government's program of discouragement of spending for nonessentials will be ruinous to jewelry industry. Minnesota Retail Jewelers Association heartily approves and fully supports your position for 5-percent retail tax. Will do anything in our power to assist.

"MINNESOTA RETAIL JEWELERS ASSOCIATION,
"MAURICE ADELSHEIM, *President.*"

"Missouri Retail Jewelers Association supporting your position on excise tax. A 10-percent tax would be ruinous to our industry. Imperative that you impress seriousness of this tax to the Senate Finance Committee.

"MISSOURI RETAIL JEWELERS ASSOCIATION,
"PHIL A. DALLMEYER, *President.*"

"Our executive committee expressed for all the jewelers of Nebraska their alarm at hearing of a suggested 10-percent tax on jewelry. This would be back breaking to our business and we see no reason why the necessary money to carry on our defense program should not be raised by spreading more evenly through income tax and other lines of business.

"NEBRASKA RETAIL JEWELERS ASSOCIATION,
"HARRY DIXON, *President.*"

"The retail jewelers of New Hampshire urge that if it's necessary to retain a tax on sales of jewelry that the rate not exceed 5 percent. We feel the proposed rate of 10 percent would be disastrous to our industry and that the revenue derived from tax would be no greater than from a 5-percent tax at point of sale. However, it does seem unfair to impose excise taxes on selected businesses. We feel a general sales tax at low rate would be a fair tax to all industries.

"NEW HAMPSHIRE RETAIL JEWELERS ASSOCIATION,
"LEONARD H. VANCORE, *President.*"

"The retail jewelers of New Jersey approve position taken by the American National Jewelers Association. Plead that you do everything possible to have tax fixed at 5 percent to avoid too drastic a curtailment of sales volume.

"NEW JERSEY RETAIL JEWELERS ASSOCIATION,
"L. J. RAD, *President.*"

"In the event it is decided to retain a tax on retail jewelry sales, the New Mexico Retail Jewelers Association solicits your support to the extent that it definitely not exceed 5 percent of sales. The people are now paying a 2-percent State tax on retail sales, and any tax over 5 percent would be most unfair to our industry, would discourage sales, curtail employment, thereby lowering income to the Government from such taxation. This same telegram went to our Senators, Congressmen, and Chairman George.

"NEW MEXICO RETAIL JEWELERS ASSOCIATION,
"FRANK FOGG, *President.*"

"The North Carolina Jewelers Association approves most heartily your efforts, contents of your telegram of August 12. Rest assured of our cooperation and support.

"NORTH CAROLINA RETAIL JEWELERS ASSOCIATION,
"G. D. BRUNS, *President.*"

"You have our approval, tax reduction to 5 percent.

"NORTH DAKOTA RETAIL JEWELERS ASSOCIATION,
"I. T. LARSON, *President.*"

"Protests are pouring into this office against the ruinous and unfair 10-percent retail jewelers' tax. We urge you to use all influence and arguments against this high tax to save our industry. In the firm conviction that a 5-percent tax is sufficient, we have wired the following telegram to members of the Senate committee: 'The Retail Jewelers of Ohio ask your help to secure a reduction from 10 to 5 percent on retail jewelry sales under section 2400 of the pending revenue tax bill. We believe a 10-percent tax is unfair to impose on our industry alone, and that such a high tax is an incentive for unfair competition and avoidance. We are convinced a 5-percent retail sales tax is more equitable and will bring the desired amount of revenue from this industry.'

"OHIO RETAIL JEWELERS ASSOCIATION,
"H. B. MCCAGUE, *President.*"

"Oklahoma jewelers unanimously favor reduction of tax rate to three. Not exceeding 5 percent.

"OKLAHOMA RETAIL JEWELERS ASSOCIATION,
"H. V. GRITZ, *President.*"

"Our State association heartly concurs with your tax committee to have rate reduced to 5 percent.

"OREGON STATE JEWELERS ASSOCIATION,
"A. W. MOLIN, *President.*"

"Wiring all members of Senate Finance Committee, all Senators South Carolina, contracting phone and wire members of association all over State urging seriousness of 10-percent retail tax or higher tax; 5 percent if possible will meet with hearty approval, 10 percent will cripple us. South Carolina will back American National Retail Jewelers Association; our position changed since my last wire to you. We wish you success.

"SOUTH CAROLINA RETAIL JEWELERS ASSOCIATION,
"RAYMOND E. COCHRAN, *President*."

"The Tennessee retail jewelers wish to emphasize the fact that they are in favor of the limit of 5-percent tax on jewelry.

"TENNESSEE RETAIL JEWELERS ASSOCIATION,
"C. C. BREESE, *President*."

"At a recent meeting of officers and directors of Texas association it was decided we should endorse the stand taken by American National Retail Jewelers Association and give you our full support to secure a reduction in tax rate from 10 to 5 percent on jewelry. We believe 5 percent will raise the amount expected from our industry. We oppose provision taxing installment and 'lay away sales' made between July 1 and signing of bill, because merchant has had no chance to inform customer or add tax to purchases, and believe it unfair to customer who must buy on installment plan.

"TEXAS RETAIL JEWELERS ASSOCIATION,
"MELROSE TAPPAN, *President*."

"Please represent to Senate Finance Committee on jewelers tax that Texas jewelers, in a meeting, feel that if a retail tax is imposed, that it should not exceed 5 percent of the sale price. Estimates show that this will raise more than the estimated amount jewelry should pay on the tax bill. Too, we trust that the committee will not penalize thousands of customers forced to buy on installment purchases made prior to the actual passage and signing of any tax measure.

"TEXAS RETAIL JEWELERS ASSOCIATION,
"H. E. DILL, *Secretary*."

"Had association meeting tonight, members voted that 5 percent tax is as much as they can stand and expect to hold their business. Am sending telegrams to Senators Aiken and Austin, and Representative Plumley.

"VERMONT RETAIL JEWELERS ASSOCIATION,
"W. S. BRIGHTON, *Secretary*."

"Washington State Retail Jewelers Association are 100 percent behind the efforts of your tax committees. Large number of telegrams sent Senators yesterday, many more today. Good luck.

"WASHINGTON STATE RETAIL JEWELERS ASSOCIATION,
"JERRY L. CUNDIFF, *President*."

"The efforts of the jewelers tax committee and the American National Retail Jewelers Association in seeking a reduction in the retail sales tax to 5 percent is heartily approved. We feel that only through such action by the Senate Finance Committee can the retail jewelers continue business and thus contribute to the national defense program in which they so strongly believe.

"WISCONSIN RETAIL JEWELERS ASSOCIATION,
"A. W. ANDERSON, *Secretary*."

The CHAIRMAN. I believe, by agreement, Mr. Printz is to precede the other two witnesses appearing on the fur tax.

Mr. Printz?

STATEMENT OF ALEXANDER PRINTZ, CLEVELAND, OHIO, CHAIRMAN, NATIONAL COAT AND SUIT INDUSTRY RECOVERY BOARD

Mr. PRINTZ. I am chairman of the National Coat and Suit Industry Recovery Board, a national organization representing 95 percent of the producers of women's and children's coats and suits. I am serving without compensation. I happen to be a manufacturer of

cloaks and suits. We employ 600 people; and while we have not been in business for 109 years, we are now in our forty-eighth year, and that is quite a record in our industry.

This memorandum is submitted on behalf of the National Coat and Suit Industry Recovery Board. May I say in this connection the recovery board is rather unique in this: It is governed not only by the members of the industry, but the unions have a very important part in and are represented on the national board.

The recovery board supports this tax. The tax upon the retail sale is simple to collect, will yield the largest revenue, and will insure to the consumer that the full tax she pays will inure to the benefit of the Government and does not represent pyramiding of profits on a tax placed at a prior source.

We should, however, like to recommend one amendment to this provision. The tax is now imposed upon articles made of fur and upon articles of which such fur is the component material of chief value. We seek a corrective amendment regarding the phrase "component material of chief value." It is important to point out to the members of this committee what this phrase means and how it has been interpreted in the past.

In order to determine the "component material of chief value" of a fur-trimmed garment, the value of the fur must be compared to the value of the cloth shell of the garment. That is the outside cloth only. To ascertain the value of the cloth shell the following items of cost must be computed; cloth, thread, allowance for handling cloth such as shrinkage, sponging, mill damage, freight, and so forth, direct labor including cutting, operating, finishing and pressing of the cloth shell, designing and an allowance for overhead allocated to the shell, and many other items too numerous to mention. Only after the cost of the cloth shell is determined after this process of computation, can it be compared with the cost of the fur, in order to determine the taxability of the garment. The details of those, if anyone may be interested, are included in the manual, Fur Tax Manual, which we passed out, and got the approval of the Treasury Department of the Government on, during the last fur-tax period.

It is apparent that with the current rapid fluctuations of the costs of materials entering into the garment, the incongruous and untenable condition will result whereby the same garment is taxable one day and tax-free the next. For example, a manufacturer with a large inventory of woolens at low prices will produce a taxable garment. And that is what we are going through right now with advances as high as 50 cents per yard on woolens. As the season progresses and he is compelled to replace woolens at a higher cost, the same garment will be tax-free, because the other component part now becomes more valuable than the fur. On the other hand, a manufacturer with a large inventory of furs at low cost will be able to produce a tax-free garment while the identical garment produced by a competitor will be taxable. It might be the identical garment made by the same manufacturer and delivered at different times.

Furthermore, the retailer will be offering for sale two identical garments at the identical wholesale price, one taxable and one tax-free.

Moreover, as we have demonstrated, the term "component material of chief value" is extremely difficult of ascertainment. The basis of computation is costly and subject to honest misinterpretation and

miscalculation, which may result in loss of revenue to the Government and subject innocent parties to penalties. Experience under the last fur tax demonstrated the inequities resulting from the operation of the phrase "component material of chief value."

The recovery board is seeking to eliminate these hardships and nevertheless be certain that the maximum revenue is collected under this provision. To this end we propose the following amendment:

SEC. 2401. *Tax on furs.*—There is hereby imposed upon the following articles sold at retail a tax equivalent to 10 percent of the price of such so sold. All articles made of fur of the hide or pelt. (That means that anything that is all fur is taxable.) There is hereby imposed upon the following articles sold at retail a tax equivalent to 10 percent of the price for each so sold. Articles of which fur is a component material which sell at retail for $71 or over.

We believe that this amendment if enacted will achieve the following results:

1. It will aid the Government. The gross revenue collected under this provision will remain approximately the same as the gross revenues collectible under the "component material of chief value" provision. The $71 retail price of a fur-trimmed garment represents in the vast majority of cases the line of demarcation at which the relative values of the cloth shell and the fur are approximately equal. Consequently, virtually all of the garments which would be taxable under the "component material of chief value" clause, would remain taxable under the proposed provision.

The Government would receive a greater net revenue under this amendment. The cost of the collection would be reduced to a mere fraction of the cost under the present provision. Only one simple inspection of the retailers' sales would be required under the proposed amendment, whereas under the present provision, both the retailer and the manufacturer would undergo complex inspection to ascertain whether a garment was taxable and whether the tax was collected. The basis of collection would be simplified and less costly since it is immediately determined upon the ascertainment of the selling price.

2. It will benefit the manufacturer. As has been demonstrated in an earlier section of this memorandum, the problem of determining taxability under the "component material of chief value" provision is highly complicated and involves a burdensome cost-accounting system on the part of the manufacturer. Furthermore, the merchandising and marketing structure of the industry may be dislocated because of the variability of the components and the fact that the same garment may be taxable one day and tax-free the next day.

3. It will aid the retailer by providing him with certain definite immediately ascertainable knowledge of whether or not a garment is taxable. If a fur-trimmed garment sells for more than $71, it is immediately taxable without reference to the question of "component material of chief value."

4. It will benefit the consumer because the present provision necessitates a costly cost-accounting system, the expense of which must be ultimately borne by the consumer. Moreover, the consumer will not be confronted with the dilemma of identical or nearly identical garments—one taxable and one nontaxable. The consumer will know that all fur-trimmed garments selling about $71 retail are taxable. Furthermore, this simple method will eliminate any possibility of fraud by imposing and keeping a tax upon a nontaxable garment.

For all of the above reasons it is respectfully urged that the amendment proposed by the recovery board be adopted.

I will be glad to answer any questions.

Senator DAVIS. Do I understand you to say you want the tax collected at the time the garment is sold to the consumer?

Mr. PRINTZ. Yes.

Senator TAFT. You prefer the retail to the wholesale tax?

Mr. PRINTZ. We do.

Senator TAFT. Representing whom?

Mr. PRINTZ. Representing 95 percent of the manufacturers in our industry, as chairman of the recovery board, which I have the honor to be.

Senator TAFT. But you don't represent any retailers?

Mr. PRINTZ. None; only wholesalers and the union.

Senator TAFT. We have had a representative of the National Dry Goods Association protesting against the retailers' end of it.

Mr. PRINTZ. I know; yes.

Senator DAVIS. You want the tax collected when the retailer sells to the customers?

Mr. PRINTZ. Yes; because that does away with all this bookkeeping and accounting on the component material of chief value. The payment of any such tax as this by the manufacturer is a very easy thing to evade and it is too often evaded. It is a simple thing for a manufacturer, if he wants to do so, to say a garment takes 3 yards of cloth, whereas it takes 2½ yards; whereupon, the picture immediately changes. There are a great many tricks in the trade; there is no point of going into that phase of it, but this is a clean proposition. You haven't to do any bookkeeping or accounting, and the Treasury Department is not confronted with almost insurmountable difficulties in the collection of the tax. For instance, a spool of thread costs 5 cents, and you have to allocate how much of that goes on the inside, in the lining, and how much on the outside. It is burdensome and impracticable. We don't care where the tax comes from but we do not want that provision as it is here. It is just absurd, and our experience with it has been far from satisfactory.

The CHAIRMAN. We had a great deal of trouble with that fur tax.

Mr. PRINTZ. Yes.

The CHAIRMAN. And never were able to get it satisfactorily adjusted.

Mr. PRINTZ. Understand, I am not speaking officially, but I have been told that the Treasury Department found the cost of collecting the tax under that chief component material rule very burdensome.

The CHAIRMAN. Mr. Beldock.

STATEMENT OF GEORGE J. BELDOCK, NEW YORK, N. Y., REPRESENTING THE FUR INDUSTRY ASSOCIATION

Mr. BELDOCK. My name is George J. Beldock. I am an attorney from New York.

May I be permitted to rise?

The CHAIRMAN. You may rise; I will sit.

Mr. BELDOCK. Thank you. Gentlemen of the committee, I appear in behalf of five fur associations of New York City, namely, American Fur Merchants Associations, 363 Seventh Avenue, New York

City; American Rabbit Dealers Association, 363 Seventh Avenue, New York City; Fur Dressers Guild, Inc., 205 West Thirty-fourth Street, New York City; Fur Dyers Trade Council, 363 Seventh Avenue, New York City; and Rabbit Dyers Institute, 276 Fifth Avenue, New York City.

I appear for the sole purpose of discussing the proposed retailers' excise tax on furs. The associations which I represent have been active trade associations for many years, and in one instance over 25 years in the fur industry. We represent the importers, the dealers, and the processors; the processors and the dyers of fur skin. I am here in support of the tax at the retail end. I may take a moment to explain the nature of the business of our membership.

As you gentlemen know the furs are trapped and imported from abroad by dealers known as importers. They own the skins. Those skins require processing and are sent to the processers who are the dressers.

After an operation similar to a tanning operation many of the skins are then dyed to suit the demands of the trade. The skins, after they have been dressed and dyed are then sold to the manufacturers to be put into the finished garment. In some cases they are sold to the cloak and suit industry who make of them a trimming for a cloth coat; and the last witness had reference to that trade. They make cloth garments fitted with fur collars and fur cuffs. The associations that I represent are not engaged in the retail business or in the manufacturing business. We are purely and simply the owners of the fur skins, the dealers and the importers of the skins, and the processers who dress and dye these skins.

Under the provisions of section 2401 of the bill, approved by the House, the tax of 10 percent would be fixed at retail. Now, the fur industry is divided on this subject. I was present and heard the representative of the National Dry Goods Association who spoke before this committee the other day, and I am mindful of his recommendation that the tax be placed on the manufacturer. I know of the activities of another group known as the fur tax committee. They are scheduled to speak here next week. They favor the tax on the dresser, upon the point of processing, and I am aware of the concerted efforts of the retailers and jobbers groups who advocate the placing of the tax not at retail, not on the manufacturer, but on the dresser. I may say that the experience of the Treasury Department and this administration in the past with the tax on the point of manufacture was very miserable and not practical. We have had no experience in this country with a tax on dressing. There has been a somewhat similar tax in Canada. This is the first time in my experience that there has been proposed a tax at the point of the processing.

Now, before I speak of the merits of our position, I should like to call your attention to what I know to be the fact, namely, that you gentlemen have been receiving a great many telegrams in connection with this matter. These are the result of a concerted drive on the part of this retailers' committee to raise a substantial fund, the purpose of which I am not aware of, to have write-ins sent to this committee by way of telegrams, letters, and so forth, forms of which have been distributed throughout the country. They have retained

a national agency to promote their interest. They have had numerous meetings in New York City and elsewhere and raised various sums of money for a fund of somewhat, between $40,000 and $50,000. They have stated that it is necessary to interest members of the Treasury Department, and that they have—and I am reading from a newspaper account—received favorable reactions from members of the Finance Committee, this committee. My purpose in referring to this is that I don't want this committee to feel that by the number of the telegrams you have received you may judge the wishes of those engaged in the fur industry. My association has sent no telegrams and we have not met other than in our membership meetings. We have raised no funds. We are here for one purpose, to ask this committee to approve the proposed tax at retail, and we do it because we think it is the only workable way the tax can be collected. A tax on manufacturers has been tried by the Treasury Department, and failed. And we say that a tax on processing will likewise be a failure. The purpose of this campaign of the retail group is a recognizable one. It is merely the old story of shifting the tax to someone else; that "the fur tax is a good tax; the industry favors it; we realize that we must pay more and make our contribution to national defense, but let the next man pay and collect the tax. It is only a good tax if I don't have the burden of collecting it." That seems to be the argument advanced by the various people who oppose the tax at retail.

We maintain that we must not overlook the fact that the consumer pays the tax. Under the proposed plan, the retailer will be simply the collector of the tax. If placed at the point of dressing, it will be passed on; to place it at the point of manufacture, it will be passed on. I wish to call to your attention the answer which you received from the representative of the National Dry Goods Association the other day, when he was asked a question by one of the Senators as to whether he felt like saying for his organization whether the tax would be absorbed. He said, "No," that in his opinion it would be passed on in any event; and he was asked whether there would be sales resistance on the part of the public if the tax be placed at retail rather than at the point of manufacture, and he said, "No,"—and he is a retailer. He said there would be no difference in sales resistance; in fact he felt there wouldn't be any resistance in either event.

In determining how the tax is to be collected, I ask you to consider the recommendations of the Treasury Department, recommendations for the collection of the tax at retail. This was approved by the House Ways and Means Committee in their report, stating that the retail tax was best by the test of administrative and equitable considerations. We favor this tax in preference to a tax on processing for a number of reasons. At the point of manufacture and dressing, there is the preparation of millions of individual fur skins, whereas at the point of retail we have a fixed selling price, and it is a simple matter for the tax to be computed on retail. Were the tax to be levied at the processing point, we would have the problem of determining the value of the merchandise.

Fur skins, although looking alike, have different values, depending on the various elements that make up such value. The seasons of the catch, whether the first or second lot of the catch, whether

purchased by a dealer who can make substantial purchases by reason of his financial standing; and, consequently, can get a different price on his purchases. The merchandise is graded according to a certain quality, and I have been identified with the fur trade for many years representing dealers, and I know there are no two dealers who pay the same price for the same skin, although they may be of the same grade; many elements are involved—elements of purchase, time of purchase particularly. I have known in one instance of a certain class of skins that sold for $1.50 a few months ago, and because of the demand in the market for that type of coat, which was a muskrat, the price of the identical skin, the same grade, the same quality, had risen to a point of $2. That was raised because of the demand and shortage and requirements of the trade for that particular skin; so, there, too, is another element; the element of style and popular demand. If the consumer, women, takes a fancy to a particular type of garment, like a beaver or muskrat, there is immediately a great demand and the price fluctuates. Now, what we say is that if you try to fix the tax at the point of dressing and try to determine then the cost of the skin, you will have to set up another agency of experts to examine every skin and determine the value of it.

Query: If I bought these skins 3 months previously at $1.50, shall I be taxed at $2, the present market value, or if the price declines to $1.60 and I still have the skins, shall I pay the tax on that value, having purchased them at the higher figure?

Senator TAFT. Do you have the title?

Mr. BELDOCK. We have the title to those skins, and we buy those skins, and frequently put them in warehouses.

Senator TAFT. Sooner or later, you sell them, do you not?

Mr. BELDOCK. Yes; and the proposed tax is to be fixed at the time the skins are processed.

Senator TAFT. That would not be practicable. What is the objection to taxing them at the time of sale?

Mr. BELDOCK. You may sell the same fur today for $2 and tomorrow or next week at some other different price.

Senator TAFT. That would make no difference. Your gross would be so much and your tax so much. After all, a retailer may sell a dress at different prices during the season.

Mr. BELDOCK. That may be true, but the reason they argued for the tax at the point of dressing was that there were only a hundred such points of processing whereas there were forty-thousand-and-some-odd retailers; that whereas the tax at retail will involve collection from many thousands and therefore require collection of the tax from many thousands of individuals, in the case of the processors there are only 110 of them; and, secondly, it is argued that is where the tax should be because it would then be confined to a group of 110 processors who could assist the Government in collecting the tax, whereas if we permitted the dealer to hold on to the furs and when he sells the lot we would have the same problem as with the old manufacturers' tax.

Senator TAFT. Why is it you couldn't compute the figures in a sale by the processors?

Mr. BELDOCK. He doesn't sell; he just performs a service.

Senator TAFT. I thought you said he had title.

Mr. BELDOCK. No; the dealer has title. He sends the fur to the dresser or dyer, the processor gets a fixed charge for his labor. He is just a servant; he performs that service and returns it to the owner upon completion; title always remains in the dealer. If we were trying to have a tax at the point of sale of the dealer you would have the same situation. He sells hundreds of thousands of furs.

One other argument here advanced is this: There are 20 to 60 to 80 skins going into a fur garment, depending on the type of garment. If we were to tax the skins at the inception, point of dressing, we have to place a value on every skin, whereas if we tax it at the point of retail there is a tax on the finished garment. There is no question about that. Whether the retailer pays $100 and makes a profit of $10 or pays considerably more and makes a profit of $200 doesn't matter. Whatever the retail price is that is used, it is and always will be the base of the computation for the tax.

I might mention that when we speak of fur skins that there are many hundreds of different types of fur skins, some of them of the variety generally known as muskrats, beavers, and Persian skins; hundreds of others are less known, such as the rabbit, the civet cat, Manchurian dog skins, all of which become a part of the fur garment, either in the coat or trimming.

Secondly, on the question of revenue, I submit that the tax on dressing will fail, in that it will fall far short of the estimated yield of $20,700,000.

As expressed by Mr. Sullivan of the Treasury Department, a 10-percent tax at retail would yield that sum, which means that if the tax were to be placed on the initial skin it would have to be not 10 percent but possibly 20 percent of the value of the skin. As you know, the finished garment includes not only the cost of the skin but the cost of the manufacturing, the trimming, the lining, the middleman's profit, and the mark-up of the retailer; and, secondly, if the present estimate of the yield of $20,700,000 from the retail sales, based on 10 percent, is correct—and I take it it is—in order to receive a similar sum by taxing the skins themselves you would have to have a much greater tax than 10 percent, the value of the skins being roughly 50 percent value of the completed garment.

Furthermore, from the point of view of raising of revenue, a tax on skins at dressing at the present time will exclude from this tax the majority of the skins already processed and manufactured into garments and in stock in various stores throughout the country, whereas a tax at retail will impose the tax on the garments regardless of when manufactured. I say that the processing from January 1 to this time has covered about 60 or 65 percent of all the skins normally to be processed this year. Those skins are in the market. They have been completed—have been manufactured into garments and are on the market for sale. If the tax were placed at the dressing the revenue from those skins, more than 50 or 60 percent, would be lost unless, of course, a floor tax were imposed, something which the entire industry, we believe, is opposed to—that is, a floor tax.

I might, in closing, refer to a comment which recently appeared in a trade paper, Women's Wear Daily, a national publication. They were trying to obtain a point of view of representative retailers as

to whether this proposed retail tax would deter sales when there was considerable talk about the resistance created by the retail tax. This has reference to an article of August 6, 1941, when the public was advised of the approval by the House of this measure, and reading from this, I quote:

> All those interviewed agree that the less said about the tax the better, and that when it comes it will be accepted just as other taxes have been. Now, that the fur coat is no longer mainly for women of wealth, the tax may cause women to wrestle with their budget, but these buyers feel the fur coat will win in sales, since buying has been simplified and payments handled on an investment basis instead of just buying another coat suitable perhaps for one season.

This covers the area of Houston, Tex., where the inquiries were made.

The CHAIRMAN. What do you have to say about the suggestion of the previous witness, Mr. Printz, that the fur is the component part of chief value? Is Mr. Printz still in the room? He doesn't appear to be.

Mr. BELDOCK. I heard his statement. He proposed that there be an exemption for those garments made of fur and otherwise where the selling price was under $71. Now, there was an exemption when the manufacturers' tax was in effect. I believe it was $75, and I am in favor of such an exemption, but I submit if, in the wisdom of your committee, it is decided——

The CHAIRMAN (interposing). It was reduced from $75 to $25, if I am not mistaken. But that is not important at this time.

Mr. BELDOCK. I believe so—I am sorry. I say, if, in the wisdom of your committee, this proposal of Mr. Printz' be adopted, then I submit to you that you consider the plight of those manufacturers who make for sale fur coats made entirely of fur that sells for $71 and under There is a very substantial branch of the industry known as the rabbit trade, which I represent and for which association I am also appearing today. There are some twenty-five to thirty million skins processed annually in that industry. Those skins are converted into cheaper, lower-priced garments. You gentlemen may have seen them in the market. They sell at wholesale for $59, $49, $39.50; they are complete fur coats, made entirely of rabbit skin with no trimmings, of course. They retail for $59, $69, and some $89, depending on the quality of the skin, but the great majority retail under $71. That branch of the industry is directly in competition with the better-grade cloth coat that is trimmed and sells for $70, $80, or $90. If we are trying to do an equitable job, and if the cloth coat industry is to receive an exemption for garments under $71—and I see the logic of the argument of Mr. Printz—I say that in order to prevent a great deal of inequality that all the manufacturers of fur coats, principally rabbit skins that sell in the same price range, likewise receive that exception. You can readily see what would happen if cloth coats selling for $60 were free of tax and a fur coat selling for $60 was taxable.

The CHAIRMAN. Yes. I would like to ask you about the witness representing the National Retail Dry Goods Association. It occurred to me that there was a good deal of force in his objection to the imposition of this tax at the point of retail sale for the reason that the retailer with a garment not made entirely of fur, but having only

a component part of it, that the retailer would not be in any position to know what the relative value or actual value of the component parts of the materials in the garment was and, while that might not be a valid objection all the way through, undoubtedly there must be a line where it would be difficult for the retailer to say that this garment has fur on it; that this fur is not the material of chief value; but since he didn't make the garment and he hasn't any separate invoices on everything that is in the garment, he has a pretty difficult job; doesn't he?

Mr. BELDOCK. Yes; he has, Mr. Chairman. However, isn't that a matter of the mechanics of the collection of the tax?

We are bound to find some difficulties.

Now, doesn't the Government compel those engaged in selling or manufacturing of woolens, under the Wool Labeling Act, to go to a great deal of inconvenience to identify the content of the wool in percentages, and would it be so farfetched to recommend to the Treasury Department that when the retailer buys his garments that he obtain from the manufacturer, together with his invoice or by certification on the invoice, some reference to the value of the fur as compared to the value of the cloth?

The CHAIRMAN. I suppose he could do that, but it appeals to me as being a rather forcible objection.

Mr. BELDOCK. It is, sir; but I don't believe that objection goes to the kernel of the whole tax question; that is only one portion of it. Then, we have a great part of the industry which hasn't the component-part problem.

The CHAIRMAN. Yes; that is not so difficult.

Mr. BELDOCK. I realize the problem confronting the committee. I feel that the Treasury Department has thoroughly investigated the matter, and I know they recommend this tax at retail, after a great deal of deliberation. I say that the Treasury Department believes in the collectibility of this tax. It has had the experience with the manufacturers' tax, and I think their judgment is better than mine and better than those who propose the tax on dressing who have had no experience with that at all.

Senator TAFT. If you had reduced Mr. Printz' exemption, $50, then there would be no such objection that you have raised to the $70?

Mr. BELDOCK. That depends on whether the $50 was at retail or wholesale.

Senator TAFT. Retail.

Mr. BELDOCK. Yes; that would cover a good portion of the rabbit coats; but still there is a close line, and it would be very hard to divide—that is, the man who sells the rabbit coat at $50 or $60 from the man who sells the cloth coat at $50 or $60.

Senator TAFT. Only if they sold it under $50.

Mr. BELDOCK. Yes; there are a great many sold under that figure. There are a great many cheaper garments sold at $50, average.

(Mr. Beldock submitted the following letter for the record:)

SILBERMAN FUR CORPORATION,
New York, August 19, 1941.

Mr. GEORGE J. BELDOCK,
Ambassador Hotel, Washington, D. C.

DEAR MR. BELDOCK: I have read a newspaper account of the arguments presented before the Senate Finance Committee by Mr. Charles Gold, counsel

for the Retail Manufacturing Furriers of America, Inc., who was arguing that the proposed Federal tax on furs be placed at the point of dressing. I know that you are in Washington to appear before the committee and present your arguments in support of the tax to be placed at the point of retail sales.

I would like you to point out to the committee the following argument against placing the tax at the point of dressing:

Since the outbreak of the war, the American fur trade has lost most of its export business and has been trying very hard to increase its exports to the South American countries, which is the only export market we have available to us at the present time. It so happens that the dressing and dyeing industry in South America is not developed and many South American furriers buy their fur skins raw and have them dressed in the United States. If a 10-percent tax were to be imposed at the point of dressing, it would automatically mean that the South American buyer would find that furs bought in the United States cost him 10 percent more than in the normal market. This would, undoubtedly, create a situation whereby the South American customers would try to buy their furs elsewhere or develop their own dressing trade, which would take away employment from the United States citizens.

I am sure it is not the intention of the Senate Finance Committee to harm our export trade in their desire to derive additional revenue by placing a tax on furs.

Very truly yours,

SILBERMAN FUR CORPORATION,
J. D. SILBERMAN.

The CHAIRMAN. Mr. Fillmore.

STATEMENT OF EDWARD FILLMORE, NEW YORK, N. Y., REPRESENTING THE ASSOCIATED FUR COAT & TRIMMING MANUFACTURERS, INC.

Mr. FILLMORE. Mr. Chairman and gentlemen, my name is Edward Fillmore. I am here in behalf of the members of the Associated Fur Coat & Trimming Manufacturers, Inc., which is a New York membership corporation. Its 750 members—individuals, corporations, and partnerships, all are engaged in the manufacture of articles made of fur. They employ approximately 10,000 skilled workers of various crafts and produce fully 85 percent of the fur-wearing apparel, including fur trimmings for cloth garments, sold within the United States. Therefore, any tax, regardless of where it may be imposed on fur articles, must necessarily affect every member of this association.

Despite the fact that the proposed tax is discriminatory because fur garments are the only articles of wearing apparel that have been singled out in this measure for taxation, since Congress, in its wisdom, because of a national emergency, and the Government's need for revenue, has seen fit to impose "an excise tax of 10 percent on the retail price of articles made of fur and articles of which fur is the component material of chief value," we unhesitatingly approve the action of Congress, and we give our support to a tax on the retail price of furs, as provided for in the section of the bill covering.

The sole reason for our appearance before the Senate Finance Committee in support of the tax on furs, as provided for in the new revenue bill now before the Senate, is because of the organized opposition by the retailers and the campaign which they are waging in order to influence the Congress to shift this proposed tax to some other point, regardless of the consequences as to how unsound, dangerous, and undesirable such a shift would be, or how little revenue the Government would obtain through such a shift.

The retailers and opponents of this proposed tax, as now provided

for in the revenue bill, undoubtedly being fearful of criticism in these critical times, in the event of open opposition to the imposition of a tax on the retail price of fur articles, conceived the ingenious idea of avoiding such criticism by advocating that the tax on furs be shifted from the retail sales prices of fur articles to the skins at the point of dressing.

Every branch of the fur industry, excepting the retailers, is unalterably opposed to the shifting of the tax from the retail price of manufactured articles to the skins at the point of dressing, as advocated by the retailers, or shifting the tax to a manufacturers' sales tax as has been proposed by the representative of the National Retail Dry Goods Association, inasmuch as the attempt to accomplish this end is motivated by pure selfishness and is definitely opposed to the best interests of the Government, the consumer, and the fur industry as a whole.

Senator CLARK. The tax is ultimately on the consumer anyway, isn't it?

Mr. FILLMORE. Certainly.

We submit briefly our reasons for supporting the action of the House in levying this tax on the retail sales price and our opposition to its being shifted to the skins at the point of dressing.

Point I.—The retail sales price of articles made of fur, or of which fur is the component material of chief value, is the only logical point for taxation—easiest to administer—will yield the most revenue, and will be least disturbing to the industry.

The United States Treasury Department in its report to the Ways and Means Committee, respecting the Government's need for revenue, recommended among other things a 10-percent excise tax on the retail sales price of articles made of fur. This recommendation of a tax on the retail sales price was undoubtedly the result of expert study of the subject by the Treasury Department, including its difficult administrative experience with the manufacturers' excise tax on furs that had been imposed in previous revenue measures. And I endorse the chairman's statement, when he said what difficulties they have had with this manufacturers' excise tax It may interest the committee to know that I have appeared before every committee that has considered this tax since the World War, and I was the first one to be consulted, and, because having had over 30 years' experience in the fur business, they deferred somewhat to my opinion when the regulations were written.

The revenue quota to be obtained from the fur trade was fixed by the Treasury Department at $20,700,000. The Treasury Department undoubtedly based this figure on its knowledge that the total sales of fur-wearing apparel and articles of which fur is the component material of chief value is approximately $207,000,000.

Hence, if the Government requires at least $20,000,000 of revenue from the fur trade, it could not be obtained at any point other than the retail sales price, at a 10-percent rate. Of course, if you raised the tax rate higher, that would make it prohibitive.

Despite the testimony of the retailers before the Ways and Means Committee, in opposition to the proposed tax on the retail price, and despite their suggestions to Ways and Means Committee to have the tax shifted to some other point, the Ways and Means Committee, after

a careful study of the subject, accepted the recommendations of the Treasury Department and voted that the tax of 10 percent be imposed on articles made of fur, and on articles of which fur is the component part of chief value, when sold at retail.

As a tax on fur articles appears unavoidable, and the revenue for governmental needs is imperative, we concur with and approve the action of the Ways and Means Committee in imposing a tax of 10 percent on the retail sales price of articles made of fur and of articles of which fur is the component material of chief value because—

(*a*) It will indisputably yield the greatest amount of revenue.

(*b*) It will be least burdensome and disturbing to the industry.

(*c*) No one will have to finance or advance the tax, and it will be payable by the retailer only when the article will have been sold to the consumer.

(*d*) It is simple and specific.

(*e*) It is easily collected and offers no administrative difficulties. There was some mention made of the difficulties to be experienced in collecting this tax from about 40,000 retailers. The answer to this is that the Government has been collecting our income taxes from 13,000,000, and it is now proposed to increase that number to 23,000,000 individuals. I can't see that is a valid objection to a tax on the retail sales price.

(*f*) It is not an experimental tax and will create no confusion.

(*g*) It is most fair to the consumer, as it only increases the normal cost of the article by 10 percent, which is the fixed amount of tax.

It is unscientific despite that they have it in Canada. The Treasury Department has investigated the Canadian system. Mr. Beldock was in error when he said that this system had not been before the committee. I think the committee will remember distinctly that in 1932 the same thing was urged upon it. At that time there was an excise tax on the manufacturer, and we urged the adoption of the Canadian system, feeling that the change might give some relief to manufacturers, but the committee decided, after investigating the matter fully, that it would not work here, that it was not acceptable, and they discarded it, and so did the Treasury Department.

Point II. Shifting of the tax to the skins at the point of dressing, as advocated by the retailers, would be confusing and experimental; would not yield the required amount of revenue; and would unnecessarily disturb and burden the industry without any benefit either to the Government, the industry, or the consumer.

The retailers are the only ones that advocate the shifting of the tax from the sale at retail of fur articles to the skins at the point of dressing. No other branch of the industry supports the shifting of the tax.

From advertisements sponsored by the retailers, appearing in trade papers, we are apprised that they are soliciting large contributions for the obvious purpose of influencing the Senate and organizing an effective lobby to bring this about.

They admit having engaged a well-known firm of public-relations counsel to formulate protests and flood the Senate with them. They further announce their intention to retain nationally known attorneys to present their case before the Senate Finance Committee.

We are constrained to disapprove of the methods employed by the

retailers in endeavoring to accomplish their object of shifting the tax, for if there were any merit to their objections to the tax as voted by the House, and if the shifting of the tax to the skins would benefit the trade, there would be no need of this great pressure campaign to influence the Congress, as every branch of the fur industry would support it; but recognizing that the shifting of the tax would be injurious to the trade, every branch, except the retailers, is opposed to it.

The retailers have not advanced a single sound, constructive, or convincing reason that would justify the Congress to change and shift the tax from the retail sales price to the skins at the point of dressing. I say they have not advanced any good argument, because we do not know what arguments they are going to advance, and I might say at this time I regret that the retailers advocating this change would not appear today, because they are here; they were originally scheduled to be heard at the same time we were, but presumably they wanted to hear what we had to say and so asked to be heard next week.

In the main, the contention of the retailers is that a tax on the retail sales price will engender price resistance on the part of the consumer, whereas a tax on the skins at the point of dressing would be hidden in the sale price and would not have this effect.

There is no merit to this contention. Taxes on sales price are universal and have been accepted by the consuming public, and they have not caused sales resistance in other commodities.

The buying public today is tax-conscious, and it is the intent of the Government to make the people tax-conscious. There is no advantage in resorting to any effort to hide the tax from them. Every woman will know that there is a tax somewhere which she must pay when she buys a garment, and a tax on the retail sale price will eliminate all uncertainties or conjectures.

If the tax is shifted to the skins, it would not make the garment cheaper, but, on the contrary, it would even be higher because a tax on the skins at the point of dressing will be incorporated in the cost of production and successive increments of mark-up for overhead, sales cost, and profit will be computed thereon by manufacturers, distributors, and retailers, so that by the time the articles reach the consumer the tax will have multiplied itself to the detriment of the consumer and without any increase of revenue for the Government. As a matter of fact, if you were to place a tax at the point of dressing, there the tax would be ever so much less because, supposing we would value the skin—and, by the way, the Canadian system says that the tax is fixed upon the current market value. Now, who is to say what the market value is? It may be that if you adopt that you would have to employ some expert that would value the article, or would you want to leave it to the manufacturer to make the valuation? If you did, naturally the manufacture will not value it at a higher, but at a lower price, so we would pay less taxes.

Another objection on the part of the retailers: They say that the buyer would resist if she knows of the tax. For instance, the buyer would resist and say they didn't want to pay a $100-tax on a $1,000-dollar coat. They don't have to disclose it. They may include the tax in the sales price. The article sells for $1,000, the tax included

therein is $100. As I understand the bill, that is permissible; they need not tell the buyer about it. That overcomes their objection to resistance because of the existence of the tax.

Against this form of "profiteering in tax," the consumer will have no way of protecting himself because he has no way of determining what portion of the price at which he purchases the garment represents cost and what portion is tax.

On the other hand, a tax of 10 percent on the retail sales price is not added until the garment is actually sold to the consumer, is readily computed, and does not lend itself to mathematical pyrotechnics.

The retailers are urging that Congress adopt, instead of a tax on the retail price of furs, a tax on the skins at the point of dressing. They say that Canada employs this method, and the only reason they advance for the adoption of this method is, that it would cost the Government less to administer.

In answer to this argument, we wish to point out that the United States Treasury Department has examined the Canadian system of taxing skins very carefully and has discarded it. The same method of taxation was also advanced to the Senate Finance Committee as long ago as 1932, and that committee, after considering the subject, with the experts of the Treasury Department, found this method of taxation impractical, and so fraught with administrative difficulties, that the committee unhesitatingly discarded it.

Senator Smoot was the chairman at that time of the Senate Finance Committee. We appeared in force, our entire industry appeared in force, because we felt it was possible that might give the industry some relief. We examined it and so did the experts, and discarded it, because we felt it was not feasible and would not produce the revenue.

While this should be sufficient to dispose of the argument in question, we want to point out that the basis of the Canadian tax is the "current market value of skins." If we were to adopt the Canadian system, it would mean that every owner sending skins to the dresser would have to put his own valuation on his own skins. Obviously, this would open up an avenue for evasion and fraud, and constant controversies would arise as to what would be considered "current market value."

The fact that such a system has been adopted in Canada is no reason for its adoption here.

If the tax were shifted to the skins at the point of dressing and the rate of 10 percent were retained, aside from its impracticability and other difficulties hereinbefore pointed out, the yield of revenue to the Government would be most uncertain and would not be half of the amount which would be obtained from a tax on the retail sales price.

No one has any records or statistics of the value of the skins dressed in any given year, and, hence, no accurate appraisal is possible, but it is fair to assume that if the total retail sales are approximately $200,000,000, as estimated by the Treasury Department, the skins could not be valued at more than one-third, which is hardly more than $66,000,000. However, assuming that the skins at the point of dressing were valued at one-half, or $100,000,000, the tax at the rate of 10 percent would yield only $10,000,000 instead of the needed $20,700,000.

Moreover, the Government would receive practically nothing or very little in the year 1941 if the tax were shifted to the skins at the point of dressing now, because substantially all of the skins to be used in this year's output by the industry have already been processed and manufactured into garments.

On the other hand, a tax on the retail sales price will yield substantially the entire tax quota since the retail sales period is just beginning.

In addition to all the foregoing arguments, the tax should remain on the retail sales price and not be shifted to the skins at the point of dressing for the following reasons:

(*a*) That a tax on the skins at the point of dressing would be impractical, experimental, uncertain, and full of administrative difficulties in the collection thereof.

(*b*) The revenue to the Government would be less than half of what it would be by a tax on the retail price.

(*c*) That there would be pyramiding and profiteering on the tax.

(*d*) That it would entail extraordinary and unnecessary hardships to all the producing branches of the trade as they could neither absorb nor finance the tax.

(*e*) That it would unproductively tie up large sums of money until the merchandise reaches the consumer.

(*f*) That there would be no benefit to the consumer, as the cost to the consumer, if the tax were on the skins, would not be less but, on the contrary, would be even higher.

I am now addressing myself to that part of the provision which deals with the "component material of chief value." I have heard the witness, Mr. Printz here, on the subject, and this is our point on it. We are vitally interested in this specific provision because we are manufacturers.

Point III.—That part of section 2401 which imposes a tax on "articles of which fur is the component material of chief value" must be retained.

We have reason to believe that the cloak and suit industry will join with the retailers in opposing that part of section 2401 which provides that a 10-percent tax be levied on "articles of which such fur is the component material of chief value."

We understand now they do object to it; they are offering an amendment. While we might be in accord with their views, you asked a question of the previous witness, namely, if there be any reason to consider the suggestion of the cloak and suit industry to exempt cloth coats of $71, we will have no objection to such an exemption providing the exemption will apply to fur coats as well. What we want is equal opportunity. We feel we must have that because we are in direct competition with cloth coats if the article of chief value be fur.

Naturally, the "articles" so classified consist almost entirely of the vast quantity of ladies' cloth coats trimmed with fur, which constitute the outerwear of a large portion of the women of our country, and include other articles of wearing apparel trimmed and lined with fur. Bear in mind that there are other articles besides cloth coats which have fur.

The reason for including these "articles" in the revenue law is twofold:

(*a*) The additional revenue to be derived from this source.

(*b*) Protection to the fur-coat industry against unfair competition by the manufacturers of cloth coats.

Treasury Department experts, in arriving at the revenue quota of $20,700,000 required of the fur industry, and predicated on a sales total of $207,000,000, unquestionably included in the total the sales receipts of articles of which fur is the component material of chief value. To withdraw such articles now from the application of the statute would violate all precedents established by former revenue acts and would result in a very substantial curtailment of the revenue which the Government expects to realize from the fur industry. Therefore, if the revenue quota required of the fur industry is to be realized, the tax on articles of which fur is the component material of chief value must be retained.

The fur-coat industry must be protected against prejudicial competition by cloth-coat manufacturers. Almost all cloth coats manufactured are trimmed with fur. It is the fur trimmings that sell the cloth coats. They are sold in competition with coats made entirely of fur.

When Mr. Printz talked about the cotton, of the value of the cotton, that was taken into consideration in the regulations. So, when the Treasury Department looked into it and found that no one article in a cloth coat was as valuable as the fur, and fur being the component material of chief value, the tax was fixed on the sale price of the garment.

To fully appreciate and understand this, one must get away from the old fallacy that fur coats are expensive and cloth coats are cheap. Nothing could be further from the fact. A very large majority of the fur coats sold are those made of comparatively inexpensive pelts and selling at retail for as little as $75, and in that price range. I put in there "as little as $75," but we know now that there are fur coats being sold and advertised at $39, so you can readily see that if you were to fix an exemption of $50 that the fur coats would have to pay the tax while the cloth coats would be free of tax, and that seems to us to be unfair.

Cloth coats, on the other hand, trimmed with furs, sell for $100 and upwards and frequently when adorned with costly furs, retail for as much as $500, depending on the kind of furs used.

It is thus apparent, at a glance, that these fur and cloth coats are sold in competition. Any arbitrary factor which affects the one and not the other, would disturb the balance between these industries to an extent which would be ruinous to those engaged in the industry which was put at disadavantage.

The corollary is obvious. A 10-percent tax on fur coats without a similar tax on fur-trimmed cloth coats, would tilt the scales of competition so far against the fur-coat manufacturer as to threaten his industrial existence.

Obviously, the Congress in the past has painstakingly refrained from penalizing the fur industry to the advantage of the cloth-coat industry, in so framing the provisions of the excise taxes on furs as to include fur-trimmed cloth coats, and certainly there is no reason to change this now.

Any course which would impose a tax on fur garments and exempt fur-trimmed cloth garments from bearing any portion of the tax would be inequitable and unfair to the industry.

Should it be contended that such articles should be exempted from the tax, because of the alleged difficulty of determining when fur is the component material of chief value, the answer is to be found in the fact that this provision was included in every prior revenue act which contained a provision taxing furs and no difficulty was found in administering the law or collecting the tax thereunder.

Conclusion: We rely solely on the merits of our position. We have no axes to grind and no selfish motives to actuate us. For all of the foregoing reasons, if articles made of fur are to be taxed at all, we respectfully urge:

I. That the provisions of section 2401 of H. R. 5417 with respect to a tax on furs be left undisturbed.

II. That the tax on fur articles be levied on the retail price thereof and not on the skins at the point of dressing.

III. That the provisions of said section with respect to a tax on articles of which fur is the component material of chief value, be retained intact.

The CHAIRMAN. There are some garments in which the cloth is the chief value, are there not?

Mr. FILLMORE. Mr. Chairman, I don't believe there are any. Even in the cheapest cloth garment, when they use fur as trimmings the fur is most always the component material of chief value.

The CHAIRMAN. So you think any item that has fur on it that is the component item of chief value?

Mr. FILLMORE. Yes. It would be very simple, although Mr. Printz said it would be difficult, to make the segregation. The cloth coat manufacturer knows the value of the fur article on the garment. All he has to do is to note it on the bill. The reason they don't want to do so is most likely because it will be seen what the cost of the trimmings may be—unless a general statement can be made that the fur is the component article of chief value in the garment itself.

The CHAIRMAN. Any questions?

Mr. FILLMORE. I have already stated that we opposed the manufacturers' tax. We do hope that that shall never be placed upon us unless there be a general sales tax enacted so as to cover everybody. Fur has paid more taxes than any other apparel industry.

The CHAIRMAN. Yes; I remember some of the difficulties. Thank you very much.

There are two witnesses here not listed today. Mr. Miller.

STATEMENT OF ROBERT N. MILLER, WASHINGTON, D. C., CHAIRMAN, EXCESS PROFITS TAX COMMITTEE OF THE TAXATION SECTION OF THE AMERICAN BAR ASSOCIATION

The CHAIRMAN. All right, Mr. Miller.

Mr. MILLER. My name is Robert N. Miller and I appear as chairman of the excess profits tax committee of the taxation section of the American Bar Association.

The American Bar Association has quite a number of recommendations but this is the only one that is material now in view of the rule this morning. The others can go over to some other hearing.

The CHAIRMAN. The others are administrative?

Mr. MILLER. Yes. This has reference to what is proposed in connection with the increased excess-profits tax.

The CHAIRMAN. You mean the 10-percent tax?

Mr. MILLER. Yes; that and the reversal of the deduction for income and excess-profits taxes—everything that relates to that extra billion.

The recommendation of the association is for a restoration of the provision for the adjustment of abnormalities when excessive hardship is caused by such abnormalities, either in income or invested capital. A provision having that effect has been in all the excess-profits tax laws up to the present; that is, it was in the 1917 law, the 1918 law, the 1921 law, and the 1940 law, passed last year. It was not repealed until last March, and at that time this provision—section 722—was just taken out of the law entirely and a very narrow provision having a different effect became the new section 722.

We feel that something having the same effect as section 722 as originally enacted in the Second Revenue Act of 1940 must go back into the law for the Government's own good. When the Treasury officials started to administer the Revenue Act of 1917—our first Excess Profits Tax Act—they didn't want to have anything to do with relief provisions. At first they said, "We hate this thing; we are not going to take this responsibility of supplying so-called relief." They started out making only relatively scant use of the provisions, but then they found that many of the 1917 cases were frozen up so tightly that the situation was practically hopeless. One of them said: "I wish the returns were sunk in the ocean."

Then the Treasury began to make full use of these special relief provisions and the administrative machinery began to move successfully. They began to receive the money in frozen cases, and eventually the excess-profits tax for the 5 years 1917 to 1921 was remarkably productive. I know that is true because I was one of those officials worrying about this very thing. Dr. Adams and Mr. Sterrett were the men who were in charge of Treasury excess-profits tax policies at that time, and after dealing with the 1917 returns, these two men saw to it that a broad relief provision was again inserted in the new law, that is, the Revenue Act of 1918, and again in the 1921 law. Both men were sure that the Government had to have such provisions in the law in order to keep the money coming in, because abnormalities do occur. They produce absurd situations, and thus result in litigation and delay for the Government.

It was found that these provisions were even more essential to the Government than to the individual in getting money, in any situation where very high tax rates are involved. The excellent productivity of those revenue acts is well known, and it was due in large part to the fact that the Treasury could and did act under broad relief provisions.

The only other thing I want to say is this: If anyone suggests that the present law as it stands—that is, with the old section 722 out and the new section 722 in—gives the Government these adjusting powers which it needs and must have in substantially all the cases, you don't have to take my word for the fact that it does not. If you just

read the present provisions which purport to adjust these abnormalities and see how narrow they are, you will realize that of the total number of cases in which the Government would need such relief, only a small fraction could be effectively dealt with under existing law.

I won't go into details; those details are in the statement I have filed, but I mention this: One of the things which produces crazy results is abnormality in invested capital. Nowhere in the present law is any power given to the Commisisoner to recognize and adjust that type of abnormality. It was in the old provision; it is not there now. The new section 722 has nothing to do with anything but base period income, and as to base period income—just to show you how small an area is covered—of all the possible abnormalities which might arise, it is limited to just two. A company has to change the character of its business or suffer an interruption during the base period for its case to be affected by the present section 722, and no other type of abnormality of income is covered. It couldn't possibly be true that the few situations that are specifically picked out in these relief provisions are sufficient to give the Commissioner the power he needs in the great field of business.

One other example and I am through.

In the present section 722 changes in business under certain conditions are recognized as an abnormality and as a reason for making an adjustment. This section says that such adjustments shall occur only if the change in business came on or before January 1, 1940; that is, if the change does not exist until January 2—1 day later—it is in this category of things with respect to which the Commissioner cannot make an adjustment under this law.

I do not mean now to be rubbing in the illogic of making perhaps millions in taxes for one taxpayer depend on whether a thing happens on the 1st or 2d; I am bringing it our merely as an illustration—and I could point out 40 of them—to show that a general relief provision is still needed. Dr. Adams and Mr. Sterrett simply had to have such general powers, to make the law work, and they are omitted from this law. I have been in touch with the administration of the revenue laws for 20 years. I have yet to hear any man who ever carried the burden of trying to get money out of a high rate excess-profits tax say that the Government could get along at all without the power to straighten out abnormalities—make them right and clean them up.

The CHAIRMAN. I wish you would convince the Treasury of that because I have attempted and failed. I did my very best in the excess-profits tax, and then subsequently, of course, we were able to do something which did give some relief in certain narrow cases.

Mr. MILLER. Those provisions are good as far as they go, but they cover such a narrow field. We are not moving in the right direction if we use all our effort trying to convince the Treasury. Is it not the responsibility of Congress to pass good laws?

The CHAIRMAN. Yes; that is true, but the Treasury Department has to furnish us with considerable data and information, and we have to regard it, and the Treasury Department just didn't want to assume the burden of making these adjustments; they thought it would lead up to too much trouble.

Mr. MILLER. As I said, the Treasury Department hated like poison in 1917 to exercise the powers they already had. They were afraid of

congressional investigations and that kind of thing, but they were driven to it, and if the gentlemen who are advising the Treasury now had ever actually administered such a provision for adjustment of abnormalities, actually ever done this thing, they wouldn't be so afraid of it. A man who has never learned to swim is afraid of the water. It gives him the shivers to go near it, but once he overcomes that fear, it is different. Furthermore, if a man takes office as Secretary of the Treasury or Commissioner of Internal Revenue, there are problems that go with those jobs, and the Government needs the kind of service that will try to solve those problems. As a matter of fact, the difficulty of valuation, the difficulty of dealing with depreciation, or invested capital, and other problems under this law are no harder and no easier than this adjustment problem. It is one of those tasks that go with being Secretary of the Treasury or Commissioner of Internal Revenue. A soldier doesn't like going into battle, but when his country's good requires him to go into battle, he assumes the responsibility and goes

The CHAIRMAN. I agree very definitely with your views and I am very glad to have you express the thought here that the Treasury, the Government itself, needs some elasticity and power to make these adjustments of abnormalities both in investments and income.

Mr. MILLER. That is absolutely correct, and if Dr. Adams or Mr. Sterrett were alive they could tell you better than I. They carried that burden. Here is what happens: Suppose you had four companies in an industry and they were very nearly alike, about the only difference being that one of them has a long history behind its invested capital—reorganizations and that kind of thing. Because of some peculiar provisions of law, this unfortunate corporation finds its tax a million dollars while the other three have only half a million to pay, but it is apparent that the taxes for all four ought to be the same—this one just ran afoul of a provision which produces an unconscionable result in its case.

Senator GUFFEY. Didn't you have that situation in Pennsylvania where there were two corporations, steel corporations, involved?

Mr. MILLER. I don't clearly recall that case.

Senator GERRY. I think I remember the case.

Mr. MILLER. What I have in mind is, this fellow isn't going to pay the million dollars without a long fight. It would ruin him to pay when his competitors do not; he can't, and that case gets frozen after a time, and you have only long delay instead of collection.

The CHAIRMAN. Litigation?

Mr. MILLER. Yes; litigation and all the rest of it. The Government needs to do justice, and to do justice you have to have the statutory power.

The CHAIRMAN. Thank you very much.

(The statement submitted by Mr. Miller is as follows:)

STATEMENT OF ROBERT N. MILLER, CHAIRMAN, EXCESS PROFITS TAX COMMITTEE OF THE TAXATION SECTION OF THE AMERICAN BAR ASSOCIATION

THE NEED FOR RESTORING TO THE EXCESS-PROFITS-TAX LAW A BROAD PROVISION FOR ADJUSTMENT OF ABNORMALITIES OF INCOME OR OF CAPITAL

The American Bar Association, at the last meeting of its house of delegates, directed the section of taxation to ask the Congress to restore to the excess-profits-tax law a provision giving the Commissioner the power, granted in sufficiently

general terms, of making adjustments for abnormalities of income and invested capital, which results in excessive hardship. Provisions having this effect were in the Revenue Act of 1917, the Revenue Act of 1918, and the Revenue Act of 1921, and proved workable and highly useful to the Government. As you know, there was also such a provision in the Second Revenue Act of 1940, but it was removed last March. The kind of provision we have in mind would be a "technical" provision just as definitely as the provisions about invested-capital or excess-profits net income, in that the computation of the tax could not be regarded as finished until the adjustments called for by this provision had been made, if the case were one involving abnormalities requiring adjustment.

1. *General statement as to need for broad provisions for adjusting abnormalities.*—The Government is in much greater need of having such a provision in the tax law than any taxpayer is. It happens that I know this from my own experience as an official of the Treasury when the Treasury was forced to deal with the Revenue Act of 1917.

Professor Adams, of Yale, and Mr. Sterrett, of Price, Waterhouse, who for a while devoted their whole time to managing the excess-profits-tax administration, are dead, but I saw them from day to day while they were carrying that burden, and I know that they saw to it that such provisions were continued in the Revenue Act of 1918 and in the Revenue Act of 1921 because they were useful to the Government. I am also convinced that if the present Treasury advisers had actually lived through the audit of tax returns under any excess-profits-tax law, they would see as clearly as Dr. Adams and Mr. Sterrett did, that there is a compelling administrative necessity for such provisions.

The fact is that these provisions were in the 1917, 1918, and 1921 laws not because of the importunities of taxpayers but because the Government needed to have them there. About 18 months after the returns under the Revenue Act of 1917 had been filed it became clear that there were a very large number of important cases which were frozen in the Bureau. As to some of these cases, the Bureau felt very uncertain as to what the technical amount of tax really was under the law. As to others, the Bureau, following technical provisions of the law, was demanding a great deal more money than the taxpayer could possibly afford to pay. The Treasury then, as the Treasury now does, hesitated to assume the responsibility of acting under broad relief provisions, but the Treasury officials found that, if they did not so act, almost endless litigation, as well as interruption of the revenues, must necessarily occur. It was the judgment of the Treasury at that time that the Treasury got more money, both in the short run and in the long run, because they could act under those relief provisions.

To give a specific illustration, suppose there are four important competitors in a certain industry, very similarly situated as regards product, customers, etc. Three of them are normal, and each of the three liable for excess-profits taxes of $500,000. The other is peculiar as to its financial and corporate history or as to certain features, and as a result would have to pay $1,000,000 under the technical provisions of the law. In a common-sense view of the whole situation, we will say, this result is one that Congress could not have wanted. It will necessarily put the abnormal competitor at a terrific disadvantage in competition with the other three, all because of matters which happened long before the excess-profits-tax law was passed.

In such a case the taxpayer who is the victim of the technical provisions of the law cannot afford to agree to what the Government must demand under those provisions, and simply has to fight to the end; furthermore, the chances are that somehow or other the courts will find a way to prevent the obvious injustice caused by the technical provisions. But if the law furnishes an equalizing formula, such as has been provided in the other excess-profits-tax laws, the Government can do justice and get the money in promptly from all four of those taxpayers instead of only three.

I think it is especially important in this connection that Dr. Adams and Mr. Sterrett, after grueling and long-continued experience with the frozen cases, decided not only to make full use of the relief provisions of the 1917 law instead of resisting their use, but saw to it that similar provisions were introduced in the other two later revenue acts as to which they gave advice—that of 1918 and that of 1921.

Do the various specific relief provisions which are now in the excess-profits-tax law constitute an adequate substitute for such a general provision? We have only to read those provisions to see that they cover only a small part of the necessary area of relief. The actual language of the provisions is full of express limitations.

For instance, take the present section 722 of the law, which was substituted last March for the general provision. It is entitled "Adjustment of Abnormal Base Period Net Income." In the first place, you see that it has nothing to do with abnormal income in the current taxable year, nor with any abnormality of invested capital. Instead of dealing with all abnormalities of base-period income, it relieves no abnormality unless it arises from (1) a change in the character or business or (2) an interruption of production; certainly no one could say that all abnormalities of income arise from these two somewhat unusual causes. In the second place, even if the case meets these requirements, there are other express and specific limitations written into the provision. A particular case which runs afoul of any of those specific limitations gets no relief whatever under that section, however clearly it is within the spirit of the relief provisions.

As an example of such a limitation, it is to be noted that a taxpayer which changed the character of its business during the base-period years or on January 1, 1940, is given a certain type of limited relief; but the act is so drawn that if the change occurred on January 2, 1940, or thereafter, the taxpayer gets no relief whatever under the section. I am not now trying to emphasize the obvious unfairness of a limitation under which millions in tax may depend on whether the business changed its character on one day or on the day following; I am merely illustrating the fact that anyone who says that the specific relief provisions in the law can be depended on to relieve practically all the cases that need relief should read the provisions and discover that their actual terms prevent any such conclusion. They relieve only some of the anticipatable cases, and none of those which have not been foreseen.

For another illustration, consider section 721. The title is "Abnormalities in Income in Taxable Period," but a reading of the long provision itself shows that it is designed to operate only in certain sharply defined classes and, even when it operates, is subject to sharp limitations.

One of the most important reasons why a high-rate excess-profits tax must contain broad relief provisions is that there will be a great many cases in which neither the Government nor the taxpayer can tell from the language of the act what Congress intended in such a case. That was true under all the previous revenue acts, and it will be even more true under the present act, which is far more complicated. Specifically, it is impossible in the case of many important American corporations to determine what the invested capital is or what the basis of the corporation's property is. That proved to be true under the other excess-profits-tax acts, and as to many of the cases no actual determination was ever made, because the data were not available.

If we turn to section 723, entitled "Equity Invested Capital in Special Cases," we see that it purports to tell what shall be done in a case where the equity invested capital cannot be determined. But the statement as to what shall be done in such a case speaks in terms of the adjusted basis of the assets of the taxpayer. In almost all cases in which it is impossible to determine the invested capital it is also impossible to determine the adjusted basis of the assets, so that the section is useless in most cases. When section 722, as it stood before last March, was removed from the law, the Commissioner was left without any real power at all to deal with this important group of cases in which invested capital cannot be determined. A fuller statement regarding the limitations is given in part 4 of this statement.

As recently as last winter both this committee and the Ways and Means Committee of the House said in formal reports:

"Experience with excess-profits taxes, both in the United States and abroad, has demonstrated conclusively that relief in abnormal cases cannot be predicated on specific instances foreseeable at any time. The unusual cases that are certain to arise are so diverse in character and unpredictable that relief provisions couched in other than general and flexible terms are certain to prove inadequate."

That is absolutely true and is certainly inconsistent with any idea that limited relief provisions of the type that are in the tax law now can by any possibility give the Government the power it needs to deal with the many cases of abnormality which cannot be predicted or foreseen.

It was in recognition of all these facts that Congress in the Second Revenue Act of 1940 inserted in the law the following provision (the then sec. 722, the text of which was repealed last March):

"ADJUSTMENT OF ABNORMALITIES IN INCOME AND CAPITAL BY THE COMMISSIONER.—For the purposes of this subchapter, the Commissioner shall also have authority to make such adjustments as may be necessary to adjust abnormalities affecting

income or capital, and his decision shall be subject to review by the United States Board of Tax Appeals."

This provision has been criticized as being vague, and our belief is that it can be improved upon, but from the Government's standpoint as well as from the standpoint of the taxpayers, it is immensely better than having no general powers at all.

The American Bar Association is not asking for the enactment of any specific language, or for any specific standard by which such relief is to be computed. In its report the excess-profits-tax committee suggests one acceptable method by which such a standard can be established, but it believes that provision for the relief is the main thing and that the method is subordinate.

The only reason which suggests itself why the two committees of Congress should bring out so clearly the fact that relief provisions couched in "other than general and flexible terms are certain to prove inadequate," and yet, within a month, should take out of the law a general provision and substitute a highly limited one, is that the Treasury's advisers dislike for the Treasury to assume the responsibilities admittedly connected with the application of general relief provisions.

We submit, however, that when the Government is imposing a high-rate excess-profits tax, experience has demonstrated that, for the good of the Government, someone must be found who is willing to undertake this task. The Commissioner of Internal Revenue, advised by the Secretary, is undoubtedly the Government official to whom we have to look for the performance of these difficult and perhaps unpleasant duties. Our feeling is that these particular duties should be regarded as incident to the assumption of the office of Commissioner of Internal Revenue and that of Secretary of the Treasury, because the Government needs the service. In the same way, a soldier would much rather not undergo the dangers of battle, but if he is convinced that the country's good requires it, he is willing to undergo them.

It is clear, also, that no one can say such provisions cannot be administered, because similar provisions were administered as to the years 1917, 1918, 1919, 1920, and 1921—with remarkable success in making the applicable laws productive.

2. *Need for adjustment of excessive hardship due to abnormalities of invested capital.*—With reference to abnormalities of invested capital, it is to be noticed (*a*) that in the present condition of this law there is no provision for correcting abnormalities, no matter how oppressive the result, (*b*) that there are bound to be corporations whose situation is abnormal both as to the income credit and as to the invested capital credit, and as to those, the Commissioner is not now permitted to recognize the abnormality, (*c*) that the view of the businessman, which is an essential element in the successful enforcement of any tax, is that a tax is dangerous to business if of two competitors one is penalized in the tax rate because of what might be called ancient history—things that happened in the corporation's financial history before this excess-profits tax was thought of.

To explain this last statement, let us realize first that in times such as these American business knows the taxes have to be very high and that its interest is not in keeping tax rates down but rather in seeing to it that businesses are not ruined by unreasonable tax differentials. If two competing corporations have precisely the same normal tax net income and their situation is generally the same except as to things which happened before 1940—at a time when no issue of high-rate taxes was involved—with the result that because of different technical invested capital one business gets into the 50-percent bracket and the other into the 35-percent bracket, business cannot help regarding this differential as dangerous and unjust. So great a tax differential between two competing businesses is likely to kill one of them off. There is no question that the technical rules of invested capital might produce this dangerous result. That is the reason why section 210 of the 1917 act, sections 327 and 328 of the Revenue Acts of 1918 and 1921, and section 722 of the Code (as it existed up until March 7) were enacted.

3. *Consideration by the committee last February.*—In the report of the Ways and Means Committee dated February 24, 1941, with reference to H. R. 3531, amending the Excess Profits Tax Act of 1940, it was said:

"* * * The tax rates provided, or even higher rates, are thoroughly justified if the income subject thereto is clearly of the type intended to be reached. At the same time, equitable considerations demand that every reasonable precaution be taken to prevent unfair application of the tax in abnormal cases. The weight of the burden imposed carries with it a commensurate need for restricting its application to the cases for which it was designed.

"Sensible to these considerations, your committee and the Congress, in formulating and enacting that legislation, exercised caution both with respect to the methods provided for measuring the portion of the corporate earnings to be subjected to the tax and in alleviating the specific hardships which were disclosed. At the same time, it was observed that specific treatment designed alone for such unusual cases as could then be foreseen would not prove adequate to meet the equitable demands.

"For this reason the committee of conference on the second revenue bill of 1940 adopted a provision hastily designed to take care of unforeseeable situations by providing adjustments for abnormalities of both income and capital. This provision was known to be inadequate at that time but nevertheless was inserted in the law as a token of assurance to taxpayers that further congressional action would be taken in this respect * * *." (This reference is to sec. 722 as it was before the amendments of March 7, 1941.)

An examination of the changes made by the amendments shows that instead of adding to this section 722, which "was known to be inadequate," the amendments give a great deal less relief than the replaced section 722 did. The new section 722 relates only to the relief of two kinds of abnormalities of income in base-period years, whereas the old section 722, quoted above, gave the Commissioner power to adjust any abnormalities of income or of invested capital.

4. *Extreme narrowness of present relief provisions.*—As stated above, the provisions in the present law dealing with the treatment of abnormalities of net income are not general in character; in fact, they are so phrased and limited that it is the exceptional abnormality that can be relieved under these provisions, because of the strictness of their terms. They fail to give relief not only in cases of unanticipated abnormality but in many cases where hardship due to abnormality can be anticipated.

(*a*) No kind of abnormality of invested capital is relieved against. (See 2 above.)

(*b*) In the case of abnormalities of income for the current taxable year no adjustment is provided for, except with reference to an item which can be attributable in whole or in part to some other than the current taxable year.

The vast field of other income abnormalities in the current taxable year is left wholly unrelieved. One of them is mentioned in part 5 below—the case where income has been substantially increased merely by improving executive management or by going into a different kind of business; for instance, improvement starting in the year 1940 and culminating 2 or 3 years later in sound business results having nothing to do with profiteering or anything connected with the war situation. The only place in the law where any special treatment for abnormalities of income in the current taxable period is dealt with is section 721; even as to income which is attributable to some earlier or some later year, no relief at all is to be given unless a comparison with a 4-year test period shows that the abnormal item in the taxable period is more than 125 percent of the average amount of the gross income of the same class during the test period.

Thus the adjustment under section 721 depends entirely on how the word "class" is construed, and at best puts an unreasonable limitation on the amount of the relief. Suppose the taxpayer has an unusual item of income for services in the current taxable year, with no taint of profiteering or of war activity. Even though attributable to another year, it cannot be shifted or adjusted if the Bureau holds, in determining the average amount of the gross income of the same class during the 4-year test period, that certain other items of income abnormally received during those test years are of the same class. Also, if the income of that class in the current taxable year is, say, $125,000 and the average amount of gross income of the same class for the test period is, say, $100,000, the corporation gets no relief whatever for the $25,000 excess. In other words, this $25,000 of income is treated in this law as if it deserved to be considered excess, when it plainly is not excess income.

(*c*) The only other provisions for the adjustment of abnormalities are those dealing with base-period income for purposes of the income credit. Any relief along this line must be found either in section 711 (b) (1) (H), (I), (J), and (K), or in section 722.

In the provision concerning abnormal deductions in section 711 (b) (1) (J) there are the same difficulties as to the application of the term "class" and the same difficulties growing out of the 125-percent figure.

Suppose a corporation had to pay a fee of $25,000 in one of the base-period years for attorneys' fees in resisting an unfounded Government claim for wind-

fall taxes. That would seem to be abnormal; but if the Government should hold that the class is attorneys' fees and the company from year to year has paid attorneys' fees averaging $20,000 a year, any relief is denied here. Furthermore, if the taxpayer is otherwise entitled to relief under section 711 (b) (1) (II), (I), or (J), he does not get the relief unless the taxpayer "establishes" that the abnormality is not due to "an increase in the gross income of the taxpayer" in its base period or a decrease in the amount of some other deduction in its base period, and is not due to "a change at any time in the type, manner of operation, size, or condition" of the business (subdivision (K) (ii)).

If the taxpayer gets by all these obstacles, it is still denied the relief by subdivision (K) (iii) unless the abnormal-deduction item in the base-period year is less than the amount of the deductions of such class for the current taxable year. That is, suppose the amount paid for attorneys' fees in defending against a windfall tax claim was $30,000, and the average for attorneys' fees in the test period was $20,000, the taxpayer might get an adjustment to the extent of $5,000, but if, because of business expansion and war conditions, its attorneys' fees in the current taxable year had been as much as $30,000, section 721 does him no good.

To make this relief depend upon the peculiar conditions of the current taxable year—presumably a year influenced by war conditions—must result in the failure of any relief, in many cases which ought to have it.

(*d*) Coming now to the long and involved section 722, entitled "Adjustment of Abnormal Base Period Net Income," we find that it covers an extremely narrow class because it does not apply at all, except to cases where the taxpayer has changed the character of the business and cases where there was interruption of operations, due to the occurrence of abnormal events. In other words, no taxpayer that did not change the character of its business before 1940 or did not interrupt its operation can look to 722 for any relief whatever.

Even the taxpayer whose abnormalities are due to one or the other of the foregoing causes gets no relief except it establish the fact showing that it is outside the following limitations:

(*a*) Genuine abnormalities, no matter how unreasonable the results, cannot be considered under section 722 if they belong to the following most frequently met with instances of abnormality: High prices of materials, labor, capital, or any other agent of production, low selling price of the product of the taxpayer or low physical volume of sale owing to low demand of such product or for the output of the taxpayer.

(*b*) Even though a taxpayer suffered abnormal losses of very large sums in the first 3 taxable years, it gets no relief at all if its excess-profits net income (as computed under sec. 722) showed a reasonably good result. That is, under section 722 (b) (4), the average base period net income under section 722 can never be adjusted to a lower point than can its last taxable year in the base period. The insertion of this limitation will prevent relief under section 722, without any logical reason at all, in a considerable number of cases.

(*c*) There is no relief at all unless the tax computed without reference to section 722 exceeds 6 percent of the taxpayer's normal tax net income for such year.

(*d*) No relief under section 722 is possible except to the extent that the application of the section would result in a diminution of the excess-profits tax otherwise payable by more than 10 percent.

The fact that a great many words in the law have been devoted to the provisions about treatment of abnormalities does not mean that the provisions are broad in their effect. On the contrary, most of the words have been devoted to cutting down the area of application. The unusual cases are the ones that are relieved, the usual ones are the ones that are left unrelieved by the existing provisions.

5. *Unwisdom of taxing normal income as if it were excess income; example.*—The Government levies taxes at very substantial rates, on normal corporate income; then, an even higher rate is imposed on such part of that income as is regarded to be excess profits.

Suppose a corporation in 1940 gets a new and vigorous management, improves its product, increases its advertising appropriation, and opens up new markets. Perhaps it even begins producing an entirely different product—as for instance, a bakery adding milk to its business. As a result of these activities it succeeds, by the year 1942, in adding a million dollars to its income. Under this law,

this $1,000,000 may be taxed just as if added income of this type constituted an excess profit. The fact is that, especially in wartime, it is important that normal business activity shall not stop, and the Government must see to it that at least some of the normal businesses have a healthy growth to take the place of those businesses which, in the natural course of affairs or by reason of war emergencies, will dry up and blow away. Under a system which divides income into two classes—one to be taxed at normal rates only, and one deserving to be taxed both at normal and at excess-profits rates—this income clearly belongs in the one-tax class.

Of the two compelling motives set out in the Ways and Means Committee report dated February 24, 1941, one purpose of the excess-profits tax was to provide additional revenue and the other was to prevent the rearmament program from furnishing an opportunity for the creation of new war millionaires or the further substantial enrichment of already wealthy persons. These motives afford no possible reason for imposing this extra, high-rate tax on profits which have nothing to do with defense or the rearmament program, which do not involve profiteering and which represent merely the fruits of good management. Yet, as the example shows, this law as it stands has the effect in certain cases of imposing the tax (in addition to the normal tax) on income which is solely due to vigorous new management.

It is true that an excess-profits tax deters people from making the kind of income which is defined as "excessive profits," but it is also true that if healthy forms of income—such as profits due to better management—are defined in this law as excess profits, then the effect of this law, as now drawn, will be to stop the healthy profits as well as the unhealthy ones.

6. *Illustration showing how an improved standard could be provided.*—In response to a suggestion made during a hearing before the Ways and Means Committee that I submit a draft illustrating how a special relief provision might be phrased so as to improve on the provisions of the 1918 and 1921 laws, and yet be more specific than section 722 of the 1940 act as it was before the amendment, I did so, and include it in this statement. Although it is based in part on suggestions received from my colleagues, it is submitted with no representation that it has anyone's approval but mine. The Bar Association does not ask for any particular wording; its recommendation goes to the necessity of some broad provision for the adjustment of excessive hardship due to abnormalities, whether of income or of capital.

DRAFT OF NEW SECTION

"*Adjustment of abnormal items affecting tax for current taxable year.*—

"(a) In the case of a corporation which establishes that the amount of its invested capital credit or its excess-profits credit, or of its excess-profits net income, for the taxable year is affected by an abnormal item or items in such manner as to increase the tax, adjustment shall be made for each abnormal item as provided in subsection (b) or (c), of this section.

"(b) If the taxpayer establishes, to the satisfaction of the Commissioner, the amount of any abnormal item as it would have been if unaffected by abnormalities, then the tax under this subchapter shall be computed by substituting for the abnormal item the normal amount so established.

"(c) If the taxpayer cannot establish the amounts under subsection (b) to the satisfaction of the Commissioner, then the Commissioner shall adjust each abnormal item to a normal amount by comparison with the experience of representative corporations whose excess-profits net income in the base period or the taxable year, or invested capital, or excess-profits credit, as the case may be, is unaffected in any substantial degree by abnormalities. The tax under this subchapter shall then be computed by substituting for the abnormal item the normal amount so established.

"(d) For the purposes of this section, comparison shall be made with corporations similarly situated, as nearly as it is possible to find them, as regards the trade or business carried on, the net sales of products or the net receipts from services furnished, the capacity for production or furnishing of service, the number of units of business transacted, and the total wages paid for the production of product or furnishing of service.

"(e) For the purposes of this section, no deviation of less than — percent from normal shall be taken account of.

"(f) (Here insert the present section 722 (e), omitting the last sentence.)"
Section 732, Internal Revenue Code, would also be amended by inserting in paragraph (a) and in paragraph (c) a reference to the new section, so that determinations in connection with the new section would be subject to the same type of review as is provided for those relating to the application of section 711 (b) (1) (H), (I), (J), or (K), section 721, or section 722.

The CHAIRMAN. Senator Taft has asked that Prof. Irving Fisher, professor emeritus of Yale University, be heard this afternoon. We haven't a full committee to hear you, but there are five or six members who will be glad to listen.

STATEMENT OF PROF. IRVING FISHER, NEW HAVEN, CONN.

Mr. FISHER. I will try to be brief. I know it is the fag end of the day. I am sorry that I have not had an appointment for which I should have applied, because there are some matters here I would like to present in more detail.

I represent no special interest; am simply a student of this subject and have spent the last 2 years very largely on studying how to reform the income tax without reference to this special defense situation today; but there is one feature, in particular, of reform as I have conceived it which I think would be of very definite benefit at this time, and which would raise a revenue of between half a billion and two-thirds of a billion dollars at the start and in increasing amounts as time went on. You can incorporate this feature either in addition to the other provisions of the act as it is before you or in substitution of any parts of it which you do not approve.

I know you are having difficulty with the excise taxes and if I had to deal with them I would cut out most of them; this would take its place, and fulfill its object better, being far less costly in administration with far more equality between persons. It is in effect a luxury tax but not in the way of excise or on specific luxury articles, but a tax on luxury spending. It is essentially the same proposal as that of Ogden Mills and Thomas Adams who worked with him on the subject. In effect, it is simply a graduated tax, progressive tax, and that part of the income which is spent, the theory being that a high income is spent on luxuries and a lower income on necessities, and if you exempt $800, or whatever the minimum exemption should be, and tax only the excess above that at 5 percent up to $5,000; 10 percent up to $10,000; 15 percent up to $15,000, and so on up to 50, you have a very simple quasispending tax, easy to administer, and merely requiring a supplemental return in addition to the present income-tax return, and a much simpler form than the present income-tax return. It is a tax which would include no tax on savings. My studies have convinced me that any tax on savings is a mistake and that it really in the end raises no revenue at all, because it kills one of the chief sources of revenue; namely, the investment made by those savings; so it would merely be a change in the present income tax, but not including that part of income which is now saved and invested.

It is astonishing when you work it out in figures how a tax on savings will kill savings and future income, and thereby kill even future revenue. For instance, take the great builders of industry. Take

Henry Ford. He is supposed to have started with a blacksmith shop in 1900, worth $1,000, and he ended with the River Rouge plant 40 years later worth $700,000,000 together with his other assets. That means that through his inventiveness and management there was an increase in the capital equipment of this company at a rate of 40 percent per annum, beginning with the $1,000 a year for 40 years, making $700,000,000. During most of that period there was no income tax—a corporation tax, but no income tax. If there had been, there couldn't have been any such River Rouge plant. There couldn't have been the automobile industry as we have it today, if we had imposed an income tax on Ford's income, and an income tax on the income of his corporation, the Ford Corporation. I am taking this not from statistics but for purposes of illustration. I use his name because he is typical of such capital increases. Instead of having $700,000,000 at the end—his plant at the end—after having paid 20 percent tax every year for 40 years, he would only have $66,000,000. In other words, that tax would have killed 90 percent of the industry, and as to the revenue, the Government has not made the difference. The Government has only $16,000,000 in tax receipts out of that 20 percent. It would have been far wiser to let that accumulate and have a fortune, at the end, of $700,000,000, which could be taxed under State and Federal inheritance-tax laws. I am in favor of very high estate and inheritance taxes. That is not what I wanted to speak about, but it is a complementary part of the tax question, so if that 20 percent could be eliminated—and we now have 20 percent in corporation taxes, including undivided profits—we would not, all the time, be killing the goose that lays the golden egg. One of the greatest difficulties is that nobody even sees this disastrous effect or calculates it, and I am sorry that when adding to the income taxes in this bill there were any savings included. I would recommend that they be left out entirely.

But if you want to add anything to the bill, or substitute, for parts you don't approve of, something very workable, I recommend this as a new feature—one extremely simple. The method of computation is not adding the spendings for food, rent, and so forth, but an indirect computation, taking the receipts, just as we do now, from salaries, commissions, and the other recompenses of labor, dividends, interest, rent, and every other income that is now received, and subtract the reinvestment. That gives you the spending with some other specific deductions that are nonspending. I have it all worked out in detail if you have time to go into it. So there is a very simple method of calculating spending. I know of no revenue measure that exceeds this in simplicity. It would add very little to what you have to deal with here, and if you put it in place of the excise taxes, for instance, which might properly be done, or in place of nine-tenths of them—reduce some of the items—you would reduce the size of this bill, at the same time reducing the cost of operation a great deal, and increasing the revenue a great deal. I think that covers it.

The CHAIRMAN. Any questions, gentlemen?

(No response.)

The CHAIRMAN. You say you have the formula for ascertaining the spending worked out?

Mr. FISHER. Yes.

The CHAIRMAN. And the suggestions of the facts on spending as you briefly described it; have you worked that out?

Mr. FISHER. Yes.

The CHAIRMAN. I think the committee would like to have it.

Mr. FISHER. Yes. I appeared before the Committee on Ways and Means and I have here what I gave them, which is somewhat longer than I gave you, but I didn't know until this morning that I was going to be here.

Senator GUFFEY. You referred to inheritance taxes awhile ago. Would you increase them to get away from these educational, charitable, church trusts, which might be designed to evade the payment of taxes?

Mr. FISHER. I would make the inheritance taxes, except for a reasonable minimum that ought to be transmitted to one's children—I would make them as heavy as the traffic would bear.

Senator GUFFEY. A case recently came to my attention where an individual died leaving an estate of $20,000,000, of which $500,000 was willed away, and the other $19,500,000 was put in educational and charitable trusts.

Mr. FISHER. I think that should be excluded, deducted; if it is a genuine philanthropy I think it should be untaxed.

Senator GUFFEY. You would exclude that entirely?

Mr. FISHER. Yes.

Senator GUFFEY. Don't you think they are occasionally designed to evade taxation?

Mr. FISHER. Yes; I think so, but if you can drive a rich man to become a philanthropist, I think you are doing a good job. What you don't want to do is to have his children and grandchildren spoiled by not wanting to work. If we are going to preserve our way of life it is essential that we not create an aristocracy such as existed in England, but I think that estate and inheritance taxes are very important. It is a tax on savings, and a saver like Henry Ford, who saves hundreds of millions, isn't doing it in order to leave it to Edsel Ford; he is simply interested in being creative, but where small savings are left for children, they ought not to be taxed.

Senator GUFFEY. You referred to it and I thought I would like to ask you about it.

The CHAIRMAN. Thank you very much.

Mr. FISHER. Here is the memorandum I have prepared for the record.

The CHAIRMAN. It will be included in the record.

(The memorandum submitted by Professor Fisher is as follows:)

As your committee is pressed for time, my statement will be confined to one recommendation only—that the new income taxes should not add to the present taxes on savings but be levied solely on spendings.

Later, when you are not so pressed for time, I would recommend a thoroughgoing reform of our present income taxes, by repealing all taxes whatsoever on savings.

By "savings" is meant any sort of capital accumulation whether of individuals, partnerships, or corporations.

These two recommendations—one for immediate adoption (namely, not to saddle savings with any new tax burdens) and the other for adoption later (namely, to take off the old tax burdens on savings)—constitute essentially the income-tax reform favored by the late Ogden L. Mills, who, in his day, was recognized as perhaps the leading American authority on taxation.

The immediate proposal is merely to place special new taxes on all personal spendings above a specified minimum exemption.

Such, for instance, as the present exemptions of $800 for single individuals and $2,000 for married couples, although I would favor lowering these a little.

For a single individual, the tax might be 5 percent on his spendings up to $5,000—that is, on whatever thereof exceeds the minimum exemption of, say, $800.

On the next $5,000, or any part thereof, i. e., up to spendings of $10,000, the tax would be, say, 10 percent.

For the next bracket up to $15,000, 15 percent.

Up to $20,000, 20 percent.

To $25,000, 25 percent.

And so on up to a maximum rate of 50 percent for the . .t $5,000 bracket (namely, $45,000 and $50,000) and beyond. Thereafter, the same 50 percent without further progression, in view of the high rates already applying to the upper brackets in our existing income-tax laws.

For married couples the bracket ranges should be doubled, that is, not $5,000 but $10,000, which is $5,000 for each of the two people.

To reckon the spendings the best way is an indirect way, not by adding up the separate spendings for food, clothing, rent, amusements, etc., but by adding up the gross receipts from all sources and then deducting certain specific items to be specified in the law. The most essential deductibles are:

All business expenses and reinvestments;

All taxes paid within the taxable years; and

Reasonable deductions for dependents.

What is left after all the deductions must necessarily be personal spendings.

A detailed schedule for thus ascertaining personal spendings is appended to this statement.

It will be seen that this proposed new tax is not merely a spendings tax but a luxury tax.

The minimum exemption and the deductions for dependents mean that there is no tax on necessities, as is involved in a sales tax. The spendings of the very poor would not be taxed at all. Only the middle class and the rich would bear the tax. Moreover, the greater the spendings—which means the more luxurious—the higher the rate.

Such a luxury tax is more truly a luxury tax than any tax which can be devised on specific "luxuries" such as costly automobiles or oriental rugs.

It is absolutely impossible to define satisfactorily a luxury as a specific object. But it is easy to specify, and with absolute definiteness, what constitutes luxurious spending and in its various gradations.

Such a tax is also one form of "incentive taxation" to use a term applied in another connection by Mr. Hazelett. For it creates an incentive for every taxpayer to spend less luxuriously. This effect is just as important in the present defense emergency as raising revenue.

Even more important than creating this incentive to cut down unnecessary spending is the incentive to save. An airplane factory should have every incentive to enlarge. But if all its earnings are taxed, including its undivided profits, plowed back in the business, this reinvestment is thereby penalized when it should be encouraged.

We should also encourage the upbuilding of our country's capital in general, as well of defense equipment in particular. Otherwise we shall impair our national capital and reduce our future national income.

Even if taxes on capital accumulation did not thus discourage and reduce that capital accumulation, the mere payment of a tax thereon automatically reduces the rate of that accumulation.

This destructive effect is far more important than is realized.

We all know that "power to tax is power to destroy," but we little realize how differently that power may be exercised. A tax on savings is many times as destructive as a tax on any other sort of income.

Moreover, a yearly tax on capital accumulation is far more destructive than a tax on the final total after the accumulator has finished his work of accumulating. At first sight the opposite might seem true, that the Government would get more revenue by taxing yearly increments than to tax the final estate created by those increments, that to tax the yearly increments is simply to tax the estate in advance and in installments. But this is not true.

It might also seem that the most revenue of all could be gotten by taxing both the estate at the end of an accumulator's life and yearly installments out of which it is built during his life. But the opposite is true.

It might also seem that the higher the tax on savings the more the revenue. But the opposite is true.

Savings on capital increases are a very peculiar and sensitive sort of income, if we choose to call them income. To tax them kills them. The consequence is, paradoxically, that the higher the tax the less the tax yields, that more can be collected out of the estate left at death than out of the installments out of which it was built and that more can be gotten by taxing the estate alone than by taxing both the estate and the installments which built it up.

All of these contentions can be substantiated mathematically. Here they will be merely illustrated by numerical examples.

Suppose at first, that the tax is 100 percent so that the whole of the savings or capital-increase is confiscated. Of course, no one would seriously propose such an extreme tax, knowing that it would put a stop to all savings and so yield no revenue at all. But such an extreme case is the clearest for beginning an exposition.

Let us also suppose that a certain man's net worth increases at the rate (before taxes) of 40 percent per year and that it does so for 40 years. This rate is high but not unprecedented.

It is said that Henry Ford became a billionaire in 40 years, from 1900 to 1940.

If there were no tax on capital increase so that the full 40 percent could be compounded for 40 years, it is true that a little blacksmith shop in 1900 worth $1,000 would become a River Rouge plant in 1940 worth $700,500,000. Halfway between, in 1921, the plant would have reached the $1,000,000 mark.

At the end of the first year, in 1901, the capital increase would be from $1,000 to $1,400, or $400. In 1921 the increase would be from $1,000,000 to $1,400,000, or $400,000. This looks as if there would be $400,000 which could be taxed in 1921.

But any tax on capital increase would prevent that $400,000 from coming into existence.

For the sake of argument let us suppose that the 100 percent tax did not deter the saver from saving. That is, we suppose that he was fool enough or saint enough to keep on each year adding 40 percent to his net worth despite the fact that the Government takes it all away from him forthwith.

In the first year he would increase his initial $1,000 to $1,400, and under a 100 percent tax, pay over to the Government the entire $400 capital increase. He would then have left $1,000, exactly what he started with. Next year the same thing would happen. He would still have only $1,000 left at the end of that year, and of every succeeding year. In the 21st year his capital increase, instead of being $400,000, will be just the usual $400. After the 40 years were up he would have the same $1,000, instead of the $700,500,000 which he would have had were there no taxes.

We see that the $700,500,000 fortune which would have come into existence were there no tax on savings has died-a-borning—died, in fact, 40 times in succession. Every time it started, the tax has destroyed it all.

But didn't the Government gain what the taxpayer lost? No; the taxpayer lost $700,499,000 and the Government gained $400 a year for 40 years, or $16,000 in all. The Government thus really lost also, for it lost the opportunity to tax an estate of $700,500,000. It had only $1,000 left to tax. For the sake of that paltry $16,000 the Government has therefore deprived itself of millions.

Worst of all, the public was deprived of the indirect benefits of that capital. It was as if the Ford plant, the General Motors plant, the Chrysler plant, and all other automobile plants had been prevented by the Government from ever coming into existence, all for the sake of collecting a total of $16,000 in taxes.

Let us now leave our impossible 100-percent example and substitute 80 percent, a rate actually approximated in the higher brackets today. Assume, as before, that every year's capital-increase is taxed separately, as it accrues.

In the first year, before taxes, the capital increase is $400. On this an 80-percent tax is $320, leaving only $80 net capital increase after taxes. This set-back to the savings has an after effect next year; for the fortune then starts at $1,080 instead of at $1,400 and clearly a 40-percent increase on $1,080 is less than 40 percent on $1,400. The second years' tax again sets back the increase and now both of these set-backs have after-effects on the third year's capital increase. The next year will feel the after effects of all 3 previous years' set-backs, and so on cumulatively. At the end of 40 years there are felt the effects of 40 successive set-backs but not all equal. The last is the least while the first is the greatest—in fact, far more than 40 times the last because of compounding.

Each year, though the fortune grows by 40 percent before the tax knocks off 32 points, the net increase is only 8 percent. The fortune thus grows not at 40-percent compound interest, as it would without the tax, but only at 8 percent. After 40 such annual set-backs, each reducing a 40-percent to an 8-percent increase and each setting back all that follows it, the final fortune is not $700,500,000 but only $21,700.

And how much did the Government get in taxes?

In the first year it collected $320, in the second $346, and so on, the collection in the last, or fortieth, year being the most—$6,437. The total through the 40 years was only $83,000. That is, the Government for the sake of getting $83,000 virtually destroyed over $700,000,000—a high administrative cost—nearly $10,000 for every $1 collected.

Let us further pursue the tax-lowering by substituting 50 percent for 80 percent. Again we find the lower of the two taxes the more profitable to the Government as it is to the taxpayer and the public.

The higher 80-percent tax would yield more in the first year, namely $320, instead of the $200 yielded by the 50-percent tax. In the second year the 80-percent rate also has the advantage, $346 instead of $240. But the advantage is not so great. Year by year the 50-percent yield creeps up on the 80-percent yield until it overtakes it in 6 years. The Government revenues under the two systems are contrasted for each of the 6 years in the following table:

Year	Government revenue under—		Year	Government revenue under—	
	80 percent	50 percent		80 percent	50 percent
1901	$320	$200	1904	$403	$346
1902	346	240	1905	436	415
1903	373	288	1906	470	497

Here it takes 6 years for the annual revenue under a 50-percent tax to overtake that under an 80-percent tax, in spite of a bad handicap at the start.

Under a 20-percent tax we find the same threefold advantage from lowering the tax rate. As to Government revenue, it is true that the 20-percent tax yields far less in the first year—only $80 as compared with $200 under a 50-percent tax. But the 20-percent revenue overtakes the 50-percent revenue in the eleventh year, when it becomes $1,284 as against $1,239.

The lower the tax rate the higher the tax yield in the end, and best results can be obtained by not taxing accumulations at all during the lifetime of an accumulator. We should only tax the accumulation on his death.

I believe in heavy estate and inheritance taxes. But if these are to bring in important revenue they must not be killed or stunted while growing, that is during the lifetime of the accumulator.

Cases as extreme as Henry Ford's are rare. But the capital equipment of America is largely the product of a relatively small number of capital creators of which he is the extreme type.

To exempt savings during life from all taxes would really pay for itself in most cases long before the death of the accumulator. For as he accumulated he would soon increase his income so much that he would spend much more. That means the Government would soon get much more than it could possibly get by taxing the savings also. The reason is that the tax on the savings kills the savings and so prevents the spendings which otherwise would follow.

The death of the accumulator usually marks the end of the rapid accumulation. From a fiscal point of view, therefore, there is usually little, if any, advantage in delaying beyond that point the taxation of savings, if savings are ever to be taxed at all; while, from a social point of view, the argument is strong to appropriate most of the accumulation. From every point of view, therefore, the death of the accumulator marks an appropriate, in fact, the only appropriate, time to tax accumulations of capital.

If we were today to repeal all our present taxes on capital increase or even merely to exempt from taxation that part of the earnings of corporations which is plowed back—the undivided profits—the result would be, in the end, not a reduction of tax revenue but a tremendous increase.

The reason and the only reason I do not recommend such a repeal at this particular time is that Congress could not be induced to make such a radical change in our tax laws without a prolonged debate. We are in a hurry, and radical reform must wait.

Some of you may wonder why I do not allege another objection, namely, that we are seeking bigger revenues now and not in the end.

This seems a big objection, but in reality it is not. For the loss in immediate revenue would be made up a hundredfold or a thousandfold in the end. Even if, in the meantime, the Government had to borrow substantially, it would be the smart thing to do. It would generate so much more income later. Why eat up our seed corn instead of planting it?

Why are we so anxious to impose heavy taxes now? The only rational answer is: "In order that we in this generation shall pay the bills of this generation and not leave so much for our successors to pay."

But that argument works just the other way. If we are trying to help the next generation we can do it most effectively by spending less and saving more now. That is precisely what would follow from putting more taxes on spendings and less on savings. Today's tax yield is not the important consideration but tomorrow's income. To tax capital accumulation is, if I may repeat, for emphasis, to kill capital accumulation—to kill the goose that lays the golden egg.

While I am forced to accept as an unfortunate fact the impossibility of suddenly so amending our tax laws as to eliminate entirely the deadly blighting tax on capital accumulation, I recommend all the more earnestly that, at this time, the mistake be avoided of adding to such taxes.

It may be pointed out that, when the time does come that your committee can take up consideration of a complete change in our income tax, the transition from the immediate emergency spendings tax as here proposed to a permanent and exclusive spendings tax can be easily made with little more legislation than to merely reduce and ultimately eliminate all the other existing taxes on income and letting the new spendings tax, which I am here proposing, remain.

Incidentally, to tax spendings as such, instead of the income as such, would, I am told by good legal authorities, circumvent the abuses of tax-exempt securities. That is, we would not ostensibly tax the income from tax-exempt bonds but would nevertheless tax all the spendings out of that income.

To some extent this benefit regarding tax-exempt securities would be felt from the adoption of the immediate recommendation, namely, to avoid adding anything to the blighting effects of taxing savings.

I know of no economic boon (except the prevention of inflation and deflation) as great as that which our people could enjoy, both rich and poor, from removing the stunting influence of taxes on capital accumulation. Moreover, removal would tend to prevent the inflation now threatening us.

APPENDIX

SCHEDULE FOR SPENDINGS-TAX RETURN

[For a given taxable year: To be filled out by taxpayer, reporting all cash yields (from work, "Investments, etc.," and cash balance]

1. Net cash receipts from salaries, wages, fees, commission.
2. Net cash receipts from private business or profession, partnership, syndicates, pools.
3. Dividends.
4. Rents and royalties.
5. Interest received, less interest paid (this may be either plus or minus).
6. Repayments of money which had been lent to others less any new loans made to others (may be either plus or minus).
7. Borrowings from others less any repayments to others[1] (either plus or minus).
8. All cash received from sales of investments, less all cash paid out in purchase of investments and less all brokerage and other expenses incidental to said transactions (plus or minus).
9. Cash from windfalls—gifts, bonuses, bequests, etc.
10. Net cash from any other sources (specify).

[1] But when these repayments to others consist of paying off a mortgage on a dwelling or other consumer-good the repayments may, for simplicity, be treated simply as spendings.

11. Total net cash yield from "Investments, etc." (sum of lines 2–10).
12. Cash on hand at beginning of year.
13. Cash on hand at end of year.
14. Net cash yield from cash balance (line 12 less line 13) (plus or minus).

Summary

15. From work (line 1 repeated).
16. From "Investments, etc." (line 11 repeated).
17. Drawn (net) from cash balance (line 14 repeated).
18. Total net cash yield from all sources (sum of lines 15, 16, 17) subject to the deductions below.

Deductions (of outgo)[2] *to be specifically authorized by law*

19. Payments, made within the taxable year, of all taxes.
20. Payments of insurance premiums for business purposes and of all life-insurance premiums.
21. Costs of medical, nursing, surgical, and dental care.
22. Funeral expenses; birth expenses.
23. Fines, forfeitures, penalties, and payments for damages.
24. Gifts and contributions subject to specific legal limitations.
25. Legally specified part of expenses for dependents.
26. Any other deductions authorized by law.
27. Total of such deductions (sum of lines 19–26).
28. Taxable spendings (line 18 less line 27).

(Whereupon, at 4 p. m., the committee adjourned until 10 a. m., Friday, August 15, 1941.)

[2] No deductions of income are here recommended other than minimum exemptions.

REVENUE ACT OF 1941

FRIDAY, AUGUST 15, 1941

UNITED STATES SENATE,
COMMITTEE ON FINANCE,
Washington, D. C.

The committee met at 10 a. m., pursuant to adjournment, in room 312, Senate Office Building, Senator Walter F. George (chairman) presiding.

The CHAIRMAN. The committee will come to order.

I expected Senator McCarran around, who wished to be heard, but he is not here now.

The first witness on this list is Mr. Briggs, of St. Paul, Minn.

STATEMENT OF CHARLES W. BRIGGS, ST. PAUL, MINN., OF BRIGGS, GILBERT & MACARTNEY

The CHAIRMAN. This is Mr. Charles W. Briggs?

Mr. BRIGGS. Yes, sir, Mr. Chairman.

The CHAIRMAN. Mr. Briggs, you have a printed brief?

Mr. BRIGGS. Yes; I have a printed statement which I would like to have printed in the record in full.

The CHAIRMAN. Yes.

Mr. BRIGGS. But I would like very briefly to touch a few of the high spots and call attention to some of the salient features of this memorandum, which is not very long in and of itself, Mr. Chairman.

The CHAIRMAN. Well, sir, your brief will be entered in the record, and we will appreciate it if you will indicate the position that you are taking in the matters that you are discussing.

You are appearing here as an attorney?

Mr. BRIGGS. I am appearing here as an attorney, as a member of the firm of Briggs, Gilbert & Macartney, which firm is in general practice in the city of St. Paul; but I represent various clients who are interested in the subject matter of this memorandum.

The CHAIRMAN. Yes, sir.

Mr. BRIGGS. Now, I should like to read a few of the salient portions of the memorandum so that the members of the committee may know what I am driving at.

This memorandum has to do with the so-called surtax on personal holding companies.

Now, in representing in a legal capacity certain personal holding companies we have encountered a very great hardship and inequity resulting to many of these companies by reason of the imposition of the so-called surtax on their undistributed subchapter A net income.

The definition of a personal holding company is one coined by a statute, as many other conceptions in the revenue act are coined.

We shall refer more specifically to this definition later on in this memorandum.

Briefly, such a company is one more than 50 percent in value of whose stock is owned by not more than five individuals and 70 percent of whose taxable income is of a restricted nature.

It is a closely held corporation and not of the type that excited so much interest and adverse criticism a few years ago.

We cannot help but feel that the Congress never intended the imposition of this surtax to work the way it does. It is a rather curious thing and arises by reason of the combined effect of several provisions of the revenue act, to which we shall call attention.

We firmly believe that the Treasury Department concedes the existence of the hardship and inequity which is the subject of this memorandum and is prepared to recommend corrective amendments when requested to do so.

We took this matter up with the Ways and Means Committee of the House, but that committee did not have before it any recommendations of the Treasury Department.

Inasmuch as the surtax on personal holding companies is to remain in the law—it is left there by House bill 5417 and made permanent by section 109 thereof—the inequity as a substantive matter of taxation should be removed by appropriate provisions in the bill ultimately to be enacted into law.

I might say here that the matter we are considering now is not an administrative matter; it is a matter that concerns the vital sections of the tax law.

Senator CONNALLY. You realize, of course, that the purpose of that act was to reach a certain situation.

Mr. BRIGGS. I realize that, Senator.

Senator CONNALLY. Naturally it is complicated in some cases. Probably in some cases it will work a hardship in order to fix these meshes so as to catch some of the fish.

Mr. BRIGGS. The trouble is that the meshes are so fixed that the fish are entirely annihilated.

Now, what I am calling attention to is to see if we can devise something that works. We feel that it works without any justification in a case that I will call to the attention of the committee.

Senator CONNALLY. It is a measure which the administration could use to differentiate between the concerns who adopted this device for tax avoidance and those who adopted it with bona fide intent, so that it would be a simple problem.

Mr. BRIGGS. The differentiation is not there. The innocent fall with the guilty, Senator.

Later on I shall call attention to three alternatives—that is, alternative proposals—by either one of which we think that this inequity could be remedied; and I think the one you are talking about could be adequately remedied by preference No. 2, and I will briefly call attention to that a little later on, Senator.

Senator CONNALLY. Pardon me for the interruption.

Mr. BRIGGS. Now, we come to the example that I put on page 2.

In order at the outset to focus attention upon the drastic nature and effect of this surtax on personal holding companies we should like to give an example of its workings: Suppose a personal holding company has current earnings in the tax year of $25,000, no capital gains and no prior accumulated earnings, and has capital losses of $30,000. Suppose it distributes $25,000 to its stockholders.

Under the subchapter A, net income surtax provisions, this personal holding company is allowed to deduct only $2,000 of its capital losses for the purpose of computing the surtax in question, which subchapter A, net income, arbitrarily determined by the act, would be $23,000 under section 500 (a) of the Revenue Code.

This personal holding company would pay as a surtax 65 percent of the first $2,000 of this $23,000, 75 percent of the remaining $21,000, plus the defense tax of 10 percent, or a total tax thus computed of $18,755.

This imposition would amount to an aggregate percentage of over 80 percent.

The ordinary corporation, not one defined as a personal holding company, in a similar situation with respect to current earnings and capital losses, would pay no tax whatsoever. See section 117 (d).

The ordinary corporation is allowed to deduct, under that section, all long-term capital losses and all short-term capital losses which do not exceed short-term capital gains.

The curious and harsh result to the personal holding company arises by reason of the fact that it cannot deduct from current earnings more than $2,000 of its capital losses in computing its subchapter A, net income, because of the provisions of section 505 (d) of the revenue act and because of the further fact that it cannot obtain or be allowed any dividends-paid credit in computing its undistributed subchapter A, net income, under section 504 of this act.

I am still referring back to the result that would flow from the example that I put.

Therefore, the burdensome surtax rates are applied to this so-called undistributed income when the personal holding company had no income to distribute. Its capital losses were more than its current earnings. Even though it distributed all its current earnings, a surtax would nevertheless be imposed. The company is in a helpless position.

Senator CONNALLY. That is just some hypothetical case.

Mr. BRIGGS. These are cases that have come to us. We have had several of these cases already.

The CHAIRMAN. They are regular cases, but you have to take into consideration the whole policy of your tax legislation during the period of years was to eliminate the holding companies—put them out of business.

Mr. BRIGGS. I realize that, but I think that elimination process ought to be lightened some at the present time, Mr. Chairman, because in the particular instance that I am putting to the attention of this committee—that is, where the personal holding company has capital losses which entirely wipe out its normal income—it is a special situation.

The CHAIRMAN. I appreciate that. I think there was a very great inconsistency on the part of the Treasury and on the part of the Government that we would propose to put out of business a form of organization which in some respects could be justified and in some respects and in some instances is justified.

Mr. BRIGGS. Yes.

The CHAIRMAN. And then did not make it possible for dissolution of the company and distribution of assets under any fair or reasonable formula.

Mr. BRIGGS. Yes; I think there are many of the personal holding companies, Senator, which ought not to be choked off, that serve a useful purpose.

The CHAIRMAN. I can agree with you, but then the effect of the legislation was practically to eliminate them or to make it very difficult for them to go along. Then, I think, in all absolute fairness, we should have made it possible for them to distribute assets and dissolve the holding companies.

We did that very begrudgingly.

Mr. BRIGGS. I think, however, Mr. Chairman, that the public purpose or the purpose to be served by the legislation to which the chairman is calling attention can be subserved and still remove this inequity from the law, and I have suggested later on three alternative methods by which I think that could be done so that the public interest could be protected and at the same time this very harsh inequity removed in the case that I put.

This unusual exaction becomes all the more an unjust penalty when the company suffers capital losses involuntarily.

One such case is where a corporation whose stock is held by a personal holding company not in control of that corporation liquidates and causes a capital loss to that personal holding company.

Such a loss would arise where the personal holding company's base for the stock was higher than the amount realized by the personal holding company as a result of the liquidation of the corporation above referred to. Another such case is where a personal holding company suffers capital losses by reason of securities held by it becoming worthless for reasons entirely beyond its control. See section 23 (g) (2).

I should like briefly to call attention to the sections that are involved in connection with this inequity about which I am speaking:

Sections of Internal Revenue Code involved.—It might be helpful to skeletonize certain sections of the Internal Revenue Code which create the inequity we are considering.

In order to arrive at the undistributed subchapter A net income of a personal holding company we start with the ordinary net income of the corporation computed in accordance with sections 22 and 23 and other applicable provisions of the Revenue Act.

Firstly, the subchapter A net income is computed.

Section 505 of the Internal Revenue Code provides as follows:

> For the purposes of this subchapter the term "subchapter A net income" means the net income with the following adjustments:
>
> (a) Additional deductions allowed:
>
> (1) Federal income, war profits, and excess-profits taxes paid or accrued during the taxable year * * *.
>
> (2) Certain contributions as defined.
>
> (3) In the case of a corporation organized prior to January 1, 1936, to take over the assets and liabilities of the estate of a decedent, amounts paid in liquidation of any liability of the corporation based on the liability of the decedent to make contributions or gifts * * *.
>
> (b) Deduction for rent is not allowed in certain instances.
>
> (c) Deduction for net operating losses provided in section 23 (s) is disallowed.
>
> (d) *Capital losses.*—The net income shall be computed without regard to section 117 (d) and (e), and losses from sales or exchanges of capital assets shall

be allowed only to the extent of $2,000 plus the gains from such sales or exchanges.

The above paragraph (d) is the one with which we are vitally concerned here, as its effect is to deny to the personal holding company, in the example given, the right to deduct more than $2,000 for the purpose of computing the surtax on its undistributed subchapter A net income.

Secondly, we compute the undistributed subchapter A net income, which is the amount to which the rates under section 500 (a) are applied in the manner above set forth.

Section 504 of the Internal Revenue Code provides:

For the purposes of this subchapter the term "undistributed subchapter A net income" means the subchapter A net income (as defined in sec. 505) minus—

(a) The amount of the dividends-paid credit provided in section 27 (a) * * *.

(b) Amounts used or irrevocably set aside to pay or retire an indebtedness incurred prior to January 1, 1934, if such amounts are reasonable. * * *

(c) Dividends paid after the close of the taxable year and before the 15th day of the third month following the close of the taxable year if claimed under this subsection in the return but only to the extent to which such dividends are includible for the purposes of chapter I in the computation of the basic surtax credit for the year of distribution.

Thirdly, as required by the provisions of section 504 (a) it will be seen that in the computation of the surtax we are concerned with the dividends-paid-credit provisions and in turn the consent-dividends-credit provisions of the Internal Revenue Code.

Section 26 provides:

In the case of a corporation the following credits shall be allowed to the extent provided in the various sections imposing taxes—* * *

(c) Dividends-paid credit.

For corporation dividends-paid credit, see section 27.

(f) Consent-dividends credit.

For corporation consent-dividends credit, see section 28.

Section 27 provides:

(a) As used in this chapter with respect to any taxable year the term "dividends-paid credit" means the sum of:

(1) The basic surtax credit for such year computed as provided in subsection (b). * * *

(b) As used in this chapter the term "basic surtax credit" means the sum of:

(1) The dividends paid during the taxable year, increased by the consent-dividends credit provided in section 28. * * *

(i) If any part of a distribution (including stock dividends and stock rights) is not a taxable dividend in the hands of such of the shareholders as are subject to taxation under this chapter for the period in which the distribution is made, such part shall not be included in computing the basic surtax credit.

That is the reason the corporation in the example which I put, after it had distributed its $25,000, was entitled to no basic surtax credit because it had no income to distribute, the capital losses having wiped out all its current earnings.

Now we turn to section 28 of the revenue act. This has to do with consent distributions.

Section 28 provides:

(a) * * *

(4) The term "consent distribution" means the distribution which would have been made if on the consent-dividends day (as defined in par. (3)) there had actually been distributed in cash and received by each shareholder making

a consent filed by the corporation under subsection (d) the specific amount stated in such consent.

Paragraph (c), which immediately follows, is very significant and very pertinent to the proposition we are discussing. I will read this paragraph (c):

(c) There shall be allowed to the corporation as part of its basic surtax credit for the taxable year a consent-dividends credit equal to such portion of the total sum agreed to be included in the gross income of shareholders by their consents filed under subsection (d),"—

Notice this language:

as it would have been entitled to include in computing its basic surtax credit if actual distribution of an amount equal to such total sum had been made in cash and such shareholder making such consent had received on the consent day the amount specified in the consent.

The effect of that language is that even though they distributed $25,000, you see, that would not have been a taxable dividend and therefore they cannot get a consent-dividend credit, because if they distributed the $25,000 they could not get any dividends-paid credit, so we are shut out under that section.

Thus it will be seen that as a result of the application of the foregoing provisions the personal holding company in the example we have heretofore given could not obtain any dividends-paid credit because the capital losses having wiped out the current earnings, a distribution to the stockholders would not be a taxable dividend to the stockholders.

Furthermore, the personal holding company in the example given could not obtain any credit under the consent-dividends-paid-credit provisions.

On page 7 I call attention to the definition of a personal holding company. I think that you will see that this is sort of a specialized type of animal, this personal holding company with which we are dealing.

Definition of personal holding company.—The term "personal holding company" is an arbitrary conception—with respect to any taxable year.

By section 501, it means any corporation at least 80 percent of whose gross income for the taxable year is personal-holding-company income with respect to any taxable year beginning after December 31, 1936, and 70 percent of whose taxable income for any year thereafter is personal-holding-company income and more than 50 percent in value of whose outstanding stock is owned directly or indirectly by or for not more than five individuals.

The term "personal holding company," however, does not include a bank, life-insurance company, a surety company, or a foreign personal holding company, or a licensed personal-finance company.

With reference to individuals, I might say that families are grouped together, that is, lineal descendants, ancestors, wives, brothers, sisters, spouses are all grouped together as a family group, so that when an individual of that group owns stock and the other individuals own stock they are all grouped together for the purpose of this act and called one individual.

I think you understand that provision.

Senator CONNALLY. That helps them, if they counted each one of them it would be much more strict.

Mr. BRIGGS. Yes; I just want to call attention to the manner of ascertaining the five individuals.

The term "personal-holding-company income" means the portion of the gross income which consists of dividends, interest, royalties, annuities, except in the case of regular dealers in stocks or securities, gains from the sale or exchange of stock or securities, rents, mineral, oil, or gas royalties, in certain instances, and certain other types of income defined by statute.

I might say that this paragraph does not define the type of income to which the rates are applied, this is the type of income which is called personal-holding-company income, which determines whether or not the company is a personal holding company within the provisions of the act.

On page 8 I have alluded to the history of this act.

History and background of provisions.—The history and background of the provisions with which we are dealing are as follows:

A good many years ago, in order to discourage the accumulation of earnings by corporations, Congress imposed surtaxes on corporations improperly accumulating surpluses. The Revenue Act of 1934 retained the surtax on corporations improperly accumulating surpluses but in addition it imposed new surtaxes on personal-holding companies by way of what is called surtaxes on undistributed subchapter A net income. This act also limited the deductibility of capital losses incurred and allowed a deduction not to exceed $2,000 for net-capital losses.

This limitation was evidently designed to prevent taxpayers offsetting depression losses against taxable income. This $2,000 limitation applied to all taxpayers, corporations, personal-holding companies, and individuals.

The 1936 Revenue Act continued the $2,000 limitation on capital losses which could be deducted by all taxpayers.

The 1938 Revenue Act removed this limitation as to individuals but continued it as to corporations, including personal-holding companies, so that they could, under this act, still deduct only $2,000 of capital losses. This act applied to 1938 and 1939 returns.

The 1939 Revenue Act amended the Internal Revenue Code in many particulars effective and applicable for the 1940 calendar year. Section 117, which has to do with capital gains and losses, paragraph (d), was amended to read as follows:

(d) *Limitation on capital losses.*—Long-term capital losses shall be allowed but short-term capital losses shall be allowed only to the extent of short-term capital gains.

This paragraph (d), applied in computing the net income of corporations and individuals for the purposes of normal income taxes, is applicable to personal-holding companies. But paragraph (d) was added to section 505, the effect of which is to disallow all capital losses in excess of $2,000 plus capital gains, in computing the surtax on the undistributed subchapter A net income, as previously pointed out.

Typical and actual cases of inequity.—The effect of the statutory provisions hereinabove considered and referred to have been considered by us in our office in several cases. The following are typical. Amounts are assumed.

1. In one case the personal-holding company had borrowed up to the limit on its marketable assets. It had to have money to pay the

operating expenses of the corporation. It had some stock which was unpledged and which could be sold at a considerable loss but on which not enough money could have been borrowed to pay the operating expenses. Therefore the corporation sold this asset at a considerable loss. The following figures are assumed. The corporation had a net income under the provisions of the code of $15,000. It had a capital loss of $50,000. It could take only $2,000 of that loss, which left a subchapter A net income of $13,000.

It had no earnings or profits accumulated since March 1, 1913. In computing its subchapter A net income it was allowed to deduct only the $2,000, but in determining whether or not the corporation had any earnings or profits for the year the total capital loss of $50,000 was deducted, leaving a net loss of $35,000. The corporation therefore had no current earnings or profits to distribute. The corporation had a pre-March 1, 1913, surplus, and it did in fact distribute more than its subchapter A net income. This distribution, however, was not a dividend, and no dividends-paid credit was allowed. There were no other deductions from the subchapter A net income, so that net income became the statutory undistributed subchapter A net income, on which a tax of $9,350 was assessed.

The above therefore was a case where the corporation was obliged by the circumstances to incur a capital loss which it would not have voluntarily incurred otherwise.

2. In another case the taxpayer—a personal holding company—held stock in another corporation. It did not have the controlling interest in such other corporation. The other corporation liquidated, and, because of the high basis of the stock in that corporation held by taxpayer, and the small value of the distribution received on liquidation, the taxpayer sustained a substantial capital loss which more than wiped out its earnings and profits for the current year. It had no accumulated earnings and profits.

Here again the capital loss was allowed only to the extent of $2,000 in figuring the subchapter A net income; the taxpayer had no earnings or profits to distribute and so could not get a consent-dividends credit; and there was no other deduction to be made from the subchapter A net income. Therefore, the subchapter A net income became the undistributed subchapter A net income, on which the surtax was assessed.

The above was a case where the corporation had a capital loss forced upon it. This corporation also distributed much more than its entire income for the year.

3. The same situation has arisen where a corporation has an impairment of capital at the start of the year. It makes its profit during the year but so much of the profit as is necessary to restore the capital impairment is treated as having been put back into the capital structure of the corporation and only the balance is treated as earnings and profits available for distribution.

This in turn cuts the dividends-paid credit to the excess of the earnings and profits over the impairment of capital and although the corporation paid out more than its income for the year the court held that only a part of that payment was a dividend.

Alternative methods of curing inequity.—We submit that the hardship and inequity should be eliminated and we submit three alterna-

tive methods or formulas, in the order of our preference, by which the elimination could be accomplished:

First preference.—Amend section 505 by striking therefrom paragraph (d).

The effect of this amendment would be to allow personal holding companies long-term capital losses in full and short-term capital losses to the extent of short-term capital gains as deductions in computing the surtax on the undistributed subchapter A net income.

Senator CONNALLY. Let me ask you there, in the case of capital losses, would it be possible, under that provision, for the company to choose what year to take those losses?

Mr. BRIGGS. I think it would.

Senator CONNALLY. In other words, if the taxes were high, they would take them, and when the taxes were low, they would not take them?

Mr. BRIGGS. I think it would be a possibility of exercising a choice there.

Senator CONNALLY. The statistics of the Treasury show that is the habit. Naturally, it is all right, as long as they can do it under the law. They withhold taking losses until rates get pretty high, and then they all at once discover that they ought to take these losses.

Mr. BRIGGS. If it is a rather precarious change, I have a better proposal which would suit us all right.

Second preference.—Section 23 (g) (1) reads as follows:

> Losses from sales or exchanges of capital assets shall be allowed only to the extent provided in section 117.

We propose that section 117 (d) be amended to read as follows:

> Long-term capital losses shall be allowed, but short-term capital losses shall be allowed only to the extent of short-term capital gains, except in the case of a personal holding company, as defined in section 501 (a), capital losses shall be allowed only to the extent of $2,000 plus capital gains.

Section 505 (d) provides:

> The net income shall be computed without regard to section 117 (d) and (e) and losses from sales or exchanges of capital assets shall be allowed only to the extent of $2,000 plus the gains from such sales or exchanges.

The effect of that would be in the case that I put, the personal holding company, while it really did not have any income at all, yet, for the purpose of these sections, it would have a net income. In other words, it would have to pay the normal corporation tax which, in the case of a corporation having more than $25,000 earnings, would be 30 percent, and then upon that would be superimposed the defense tax of 10 percent, and then the corporation surtax of 6 percent, so you get a tax of around 35 percent. That would be a special penalty which would be imposed upon a personal holding company, and the ordinary corporation in a similar situation would not pay any tax at all.

We propose, in connection with the above amendment of section 117 (d) that the above-quoted paragraph (d) of section 505 be stricken out, and that a new paragraph (a) (4) be added to section 505, to read as follows:

> The amount of capital losses not allowed as a deduction under section 117 (d).

The effect of these amendments proposed under this second preference would be a penalty to a personal holding company by requiring

it to pay a normal corporation income tax without any deduction for capital losses of more than $2,000, plus the gains from sales or exchanges of capital assets; but in the computation of the surtax on the undistributed subchapter a net income," the personal holding company would be allowed to deduct all capital losses not allowed as a deduction under section 117 (d) (amended as proposed).

Third preference.—We propose that subsection (i) of section 27 be amended so as to read as follows:

> Except for the purpose of computing the undistributed subchapter A net income of a personal holding company, if any part of a distribution (including stock dividends and stock rights, is not a taxable dividend in the hands of such of the shareholders as are subject to taxation under this chapter for the period in which the distribution is made, such part shall not be included in computing the basic surtax credit.

And we further propose that section 28 be amended by adding a subsection, as follows:

> For the purpose of computing the undistributed subchapter A net income of a personal holding company the basic surtax credit shall include amounts distributed to shareholders either from earnings or profits accumulated after February 28, 1913, or from any other source, provided that each shareholder of the corporation includes such distributions in his income-tax return for the year in question, as taxable income; and shall also include a consent-dividend credit equal to the total sum agreed to be included in the gross income of the shareholders by their consents filed under subsection (d) of section 28.

The effect of the amendments proposed under this third preference would be to give the personal holding company a consent-dividends credit in computing its "undistributed subchapter A net income" where distributions are made to its stockholders and where a sum is agreed to be included in gross earnings of the shareholders by their consent.

Senator CONNALLY. Your theory being, since the purpose of the act is to make them distribute dividends, that when they do distribute them, they ought to be free from tax?

Mr. BRIGGS. I think so. And that is the hardship that we think is caused unjustifiably by the provisions to which we have called attention.

Efforts to have inequity eliminated.—We have, on numerous occasions, taken this matter up with the Treasury Department, with the Legislative Counsel of that Department and with the office of the General Counsel of the Bureau of Internal Revenue. We understand that other representatives of personal holding companies have likewise taken this matter up. We have been assured by the Treasury Department, by its legislative counsel, and by its General Counsel for the Bureau of Internal Revenue, that the inequity of which we are now complaining is recognized, and the same should be remedied. We submitted the matter to the Ways and Means Committee of the House. We understand that the Treasury Department is prepared to submit recommendations as to how the inequity should be eliminated, but we have not yet had access to such recommendations.

We also considered this matter with the conference committee legal staff.

Schedule 1.—Certain sections of Internal Revenue Code. "Personal holding company income" as defined in the act does not enter into the computation of taxable income of a personal holding company (the tax being computed on the "undistributed subchapter A net income"), but is purely a test to determine whether 80 percent of a corporation's

gross income is of such a nature as to bring it within the classification of a personal holding company.

In order to arrive at the "undistributed subchapter A net income," we start with the ordinary taxable net income of the corporation.

The "subchapter A net income" is determined as follows:

SEC. 505 (Internal Revenue Code). For the purposes of this subchapter the term "Subchapter A net income" means the net inocome with the following adjustments:

(a) *Additional deductions.*—There shall be allowed as deductions—

(1) Federal income, war profits, and excess-profits taxes paid or accrued during the taxable year to the extent not alowed as a deduction under section 23; but not including the tax imposed by section 102, section 500, or a section of a prior income-tax law corresponding to either of such sections.

(2) In lieu of the deduction allowed by section 23 (q), contributions or gifts, payment of which is made within the taxable year to or for the use of donees prescribed in section 23 (q) for the purposes therein specified, to an amount which does not exceed 15 percent of the taxpayer's net income, computed without the benefit of this paragraph and section 23 (q) and without the deduction of the amount disallowed under subsection (b) of this section.

(3) In the case of a corporation organized prior to January 1, 1936, to take over the assets and liabilities of the estate of a decedent, amounts paid in liquidation of any liability of the corporation based on the liability of the decedent to make contributions or gifts to or for the use of donees described in section 23 (o) for the purposes therein specified, to the extent such liability of the decedent existed prior to January 1, 1934. No deduction shall be allowed under paragraph (2) of this subsection for a taxable year for which a deduction is allowed under this paragraph.

(b) *Deductions not allowed.*—The aggregate of the deductions allowed under section 23 (a), relating to expenses, and section 23 (l), relating to depreciation, which are allocable to the operation and maintenance of property owned or operated by the corporation, shall be allowed only in an amount equal to the rent or other compensation received for the use of, or the right to use, the property, unless it is established (under regulations prescribed by the Commissioner with the approval of the Secretary) to the satisfaction of the Commissioner:

(1) That the rent or other compensation received was the highest obtainable, or if none was received, that none was obtainable;

(2) That the property was held in the course of a business carried on bona fide for profit; and

(3) Either that there was reasonable expectation that the operation of the property would result in a profit, or that the property was necessary to the conduct of the business.

(c) *Net loss carry-over disallowed.*—The deduction for net operating losses provided in section 23 (s) shall not be allowed.

(d) *Capital losses.*—The net income shall be computed without regard to section 117 (d) and (e), and losses from sales or exchanges of capital assets shall be allowed only to the extent of $2,000 plus the gains from such sales or exchanges.

The "Undistributed subchapter A net income" is determined as follows:

SEC. 504 (Internal Revenue Code). For the purposes of this subchapter the term "undistributed subchapter A net income" means the subchapter A net income (as defined in section 505) minus—

(a) The amount of the dividends-paid credit provided in section 27 (a) without the benefit of paragraphs (3) and (4) thereof (computed without its reduction, under section 27 (b) (1), by the amount of the credit provided in section 26 (a), relating to interest on certain obligations of the United States and Government corporations); but, in the computation of the dividends-paid credit for the purposes of this subchapter, the amount allowed under subsection (c) of this section or of section 405 of the Revenue Act of 1938 in the computation of the tax under this subchapter or under title 1A of the Revenue Act of 1938 for any preceding taxable year beginning after December 31, 1937, shall be considered as a dividend paid in such preceding taxable year and not in the year of distribution, and in the computation of the dividend carry-over for the purposes of this subchapter, the term "adjusted net income" as used in section

27 (c) means the adjusted net income minus the deduction allowed for Federal taxes under section 505 (a) (1):

(b) Amounts used or irrevocably set aside to pay or to retire indebtedness of any kind incurred prior to January 1, 1934, if such amounts are reasonable with reference to the size and terms of such indebtedness;

(c) Dividends paid after the close of the taxable year and before the 15th day of the third month following the close of the taxable year, is claimed under this subsection in the return, but only to the extent to which such dividends are includable for the purposes of chapter 1, in the computation of the basic surtax credit for the year of distribution; but the amount allowed under this subsection shall not exceed either:

(1) The accumulated earnings and profits as of the close of the taxable year; or

(2) The undistributed subchapter A net income for the taxable year computed without regard to this subsection; or—

(3) 10 percent of the sum of—

(A) The dividends paid during the taxable year (reduced by the amount allowed under this subsection in the computation of the tax under this subchapter for the taxable year preceding the taxable year or, in the case of a taxable year beginning in 1939, by the amount allowed under section 405 (c) of the Revenue Act of 1938 in the computation of the tax under title 1A of such act for a taxable year beginning prior to January 1, 1939); and

(B) The consent-dividends credit for the taxable year.

The "dividends-paid credit" is determined as follows:

SEC. 27 (Internal Revenue Code). (a) *Definition in general.*—As used in this chapter with respect to any taxable year the term "dividends-paid credit" means the sum of:

(1) The basic surtax credit for such year, computed as provided in subsection (b);

(2) The dividend carry-over to such year, computed as provided in subsection (c);

(3) The amount, if any, by which any deficit in the accumulated earnings and profits, as of the close of the preceding taxable year (whether beginning on, before, or after January 1, 1939), exceeds the amount of the credit provided in section 26 (c) (relating to net operating losses), for such preceding taxable year (if beginning after December 31, 1937); and

(4) Amounts used or irrevocably set aside to pay or retire indebtedness of any kind, if such amounts are reasonable with respect to the size and terms of such indebtedness.

As used in this paragraph the term "indebtedness" means only an indebtedness of the corporation existing at the close of business on December 31, 1937, and evidenced by a bond, note, debenture, certificate of indebtedness, mortgage, or deed of trust, issued by the corporation and in existence at the close of business on December 31, 1937, or by a bill of exchange accepted by the corporation prior to and in existence at, the close of business on such date. Where the indebtedness is for a principal sum, with interest, no credit shall be allowed under this paragraph for amounts used or set aside to pay such interest. A renewal (however evidenced) of an indebtedness shall be considered an indebtedness.

The basic surtax credit is determined as follows:

SEC. 27 (Internal Revenue Code). * * * (b) *Basic surtax credit.*—As used in this chapter the term "basic surtax credit" means the sum of:

(1) The dividends paid during the taxable year, increased by the consent-dividends credit provided in section 28 and reduced by the amount of the credit provided in section 26 (a) relating to interest on certain obligations of the United States and Government corporations:

(2) The net-operating-loss credit provided in section 26 (c) (1).

(3) The bank-affiliate credit provided in section 26 (d).

The aggregate of the amounts under paragraphs (2) and (3) shall not exceed the adjusted net income for the taxable year.

Section 27 (i), however, provides as follows:

SEC. 27 (Internal Revenue Code). * * * (i) *Nontaxable distributions.*—If any part of a distribution (including stock dividends and stock rights) is not a taxable dividend in the hands of such of the shareholders as are subject to taxa-

tion under this chapter for the period in which the distribution is made, such part shall not be included in computing the basic surtax credit.

The consent-dividends credit is defined as follows:

SEC. 28 (Internal Revenue Code). (a) *Definitions.*—As used in this section—

(4) *Consent distribution.*—The term "consent distribution" means the distribution which would have been made if on the consent dividends day (as defined in paragraph (3)) there had actually been distributed in cash and received by each shareholder making a consent filed by the corporation under subsection (d), the specific amount stated in such consent.

* * * * * * *

SEC. 28 (Internal Revenue Code). * * * (c) *Allowance of credit.*—There shall be allowed to the corporation, as a part of its basic surtax credit for the taxable year, a consent dividends credit equal to such portion of the total sum agreed to be included in the gross income of shareholders by their consents filed under subsection (d) as it would have been entitled to include in computing its basic surtax credit if actual distribution of an amount equal to such total sum had been made in cash and each shareholder making such a consent had received, on the consent dividends day, the amount specified in the consent.

Now while this is a rather complicated subject, I hope that, in a measure, the committee has understood me and this inequity we sincerely believe should be removed.

The CHAIRMAN. Thank you very much.

Mr. BRIGGS. I thank the committee for your kind attention.

(The complete memorandum by Mr. Briggs is as follows:)

MEMORANDUM CONCERNING INEQUITABLE PROVISIONS OF THE REVENUE ACT IMPOSING A SURTAX ON PERSONAL HOLDING COMPANIES

By CHARLES W. BRIGGS, of St. Paul, Minn.

To the Honorable Walter F. George, chairman, and to the members of the Finance Committee, United States Senate:

I am a member of a firm of lawyers practicing in St. Paul, Minn.

In representing, in a legal capacity, certain personal holding companies, we have encountered a very great hardship and inequity resulting to many of these companies by reason of the imposition of the so-called surtax on their "undistributed subchapter A, net income." The definition of a personal holding company is one coined by a statute, as many other conceptions in the revenue act are coined. We shall refer more specifically to this definition later on in this memorandum. Briefly, such a company is one, more than 50 percent in value of whose stock is owned by not more than five individuals, and 70 percent of whose taxable income is of a restricted nature. It is a closely held corporation and not of the type that excited so much interest and adverse criticism a few years ago.

We cannot help but feel that the Congress never intended the imposition of this surtax to work the way it does. It is a rather curious thing, and arises by reason of the combined effect of several provisions of the revenue act, to which we shall call attention. We firmly believe that the Treasury Department concedes the existence of the hardship and inequity which is the subject of this memorandum, and is prepared to recommend corrective amendments when requested to do so. We took this matter up with the Ways and Means Committee of the House, but that committee did not have before it any recommendations of the Treasury Department.

Inasmuch as the surtax on personal holding companies is to remain in the law (it is left there by House bill 5417 and made permanent by Sec. 109 thereof), the inequity as a substantive matter of taxation should be removed by appropriate provisions in the bill ultimately to be enacted into law.

Example.—In order, at the outset, to focus attention upon the drastic nature and effect of this surtax on personal holding companies, we should like to give an example of its workings:

Suppose a personal holding company has current earnings in the tax year of $25,000, no capital gains and no prior accumulated earnings, and has capital losses of $30,000. Suppose it distributes $25,000 to its stockholders.

Under the "Subchapter A, net income" surtax provisions, this personal holding company is allowed to deduct only $2,000 of its capital losses for the purpose of computing the surtax in question, which "subchapter A, net income," arbitrarily determined by the act, would be $23,000 under section 500 (a) of the revenue code. This personal holding company would pay as a surtax 65 percent of the first $2,000 of this $23,000, 75 percent of the remaining $21,000, plus the defense tax of 10 percent, or a total tax thus computed of $18,755. This imposition would amount to an aggregate percentage of over 80 percent.

The ordinary corporation—not one defined as a personal holding company—in a similar situation with respect to current earnings and capital losses, would pay no tax whatsoever. (See sec. 117 (d).) The ordinary corporation is allowed to deduct under that section all long-term capital losses and all short-term capital losses which do not exceed short-term capital gains.

The curious and harsh result to the personal holding company arises by reason of the fact that it cannot deduct from current earnings more than $2,000 of its capital losses in computing its "subchapter A net income," because of the provisions of section 505 (d) of the revenue act, and because of the further fact that it cannot obtain or be allowed any "dividends paid credit" in computing its "undistributed subchapter A net income" under section 504 of this act.

Therefore, the burdensome surtax rates are applied to this so-called undistributed income when the personal holding company had no income to distribute. Its capital losses were more than its current earnings. Even though it distributed all its current earnings, a surtax would nevertheless be imposed. The company is in a helpless position.

This unusual exaction becomes all the more an unjust penalty when the company suffers capital losses involuntarily. One such case is where a corporation, whose stock is held by a personal holding company not in control of that corporation, liquidates and causes a capital loss to that personal holding company. Such a loss would arise where the personal holding company's base for the stock was higher than the amount realized by the personal holding company as a result of the liquidation of the corporation above referred to. Another such case is where a personal holding company suffers capital losses by reason of securities held by it becoming worthless for reasons entirely beyond its control. (See sec. 23 (g) (2).)

Sections of Internal Revenue Code involved.—It might be helpful to skeletonize certain sections of the Internal Revenue Code which create the inequity we are considering.

In order to arrive at the "undistributed subchapter A net income" of a personal holding company, we start with the ordinary net income of the corporation, computed in accordance with sections 22 and 23 and other applicable provisions of the Revenue Act.

Firstly, the "subchapter A net income" is computed.

Section 505 of the Internal Revenue Code provides as follows:

"For the purposes of this subchapter, the term 'subchapter A net income' means the net income with the following adjustments:

"(a) *Additional deductions allowed.*—(1) Federal income, war profits, and excess-profits taxes paid or accrued during the taxable year * * *.

"(2) Certain contributions as defined.

"(3) In the case of a corporation organized prior to January 1, 1936, to take over the assets and liabilities of the estate of a decedent, amounts paid in liquidation of any liability of the corporation, based on the liability of the decedent to make contributions or gifts * * *.

"(b) Deduction for rent is not allowed in certain instances.

"(c) Deduction for net operating losses provided in section 23 (s) is disallowed.

"(d) *Capital losses.*—The net income shall be computed without regard to section 117 (d) and (e), and losses from sales or exchanges of capital assets shall be allowed only to the extent of $2,000 plus the gains from such sales or exchanges."

The above paragraph (d) is the one with which we are vitally concerned here, as its effect is to deny to the personal holding company, in the example given, the right to deduct more than $2,000 for the purpose of computing the surtax on its "undistributed subchapter A net income."

Secondly, we compute the "undistributed subchapter A net income," which is the amount to which the rates under section 500 (a) are applied in the manner above set forth.

Section 504 of the Internal Revenue Code provides:

"For the purposes of this subchapter, the term "undistributed subchapter A net income means the subchapter A net income (as defined in sec. 505), minus—

"(a) The amount of the dividends paid credit provided in section 27 (a) * * *.

"(b) Amounts used or irrevocably set aside to pay or retire an indebtedness incurred prior to January 1, 1934, if such amounts are reasonable * * *.

"(c) Dividends paid after the close of the taxable year, and before the 15th day of the third month following the close of the taxable year, if claimed under this subsection in the return, but only to the extent to which such dividends are includable for the purposes of chapter I in the computation of the basic surtax credit for the year of distribution."

Thirdly, as required by the provisions of section 504 (a), it will be seen that, in the computation of the surtax, we are concerned with the dividends-paid credit provisions, and, in turn, the consent-dividends credit provisions of the Internal Revenue Code.

Section 26 provides:

"In the case of a corporation, the following credits shall be allowed to the extent provided in the various sections imposing taxes—

* * * * * * *

"(e) *Dividends-paid credit.*—For corporation dividends-paid credit, see section 27.

"(f) *Consent-dividends credit.*—For corporation consent-dividends credit, see section 28."

Section 27 provides:

"(a) As used in this chapter with respect to any taxable year, the term 'dividends-paid credit' means the sum of:

"(1) The basic surtax credit for such year computed as provided in subsection (b).

* * * * * * *

"(b) As used in this chapter, the term 'basic surtax credit' means the sum of:

"(1) The dividends paid during the taxable year, increased by the consent-dividends credit provided in section 28. * * *

* * * * * * *

"(i) If any part of a distribution (including stock dividends and stock rights) is not a taxable dividend in the hands of such of the shareholders as are subject to taxation under this chapter for the period in which the distribution is made, such part shall not be included in computing the basic surtax credit."

Section 28 provides:

"(a) * * *

"(4) The term 'consent distribution' means the distribution which would have been made if on the consent-dividends day (as defined in paragraph (3)), there had actually been distributed in cash and received by each shareholder making a consent filed by the corporation under subsection (d), the specific amount stated in such consent.

* * * * * * *

"(c) There shall be allowed to the corporation as part of its basic surtax credit for the taxable year a consent-dividends credit equal to such portion of the total sum agreed to be included in the gross income of shareholders by their consents filed under subsection (d), as it would have been entitled to include in computing its basic surtax credit if actual distribution of an amount equal to such total sum had been made in cash and such shareholder making such a consent had received on the consent day the amount specified in the consent."

Thus, it will be seen that, as a result of the application of the foregoing provisions, the personal holding company in the example we have heretofore given, could not obtain any dividends paid credit, because the capital losses having wiped out the current earnings, a distribution to the stockholders would not be a taxable dividend to the stockholders.

Furthermore, the personal holding company in the example given could not obtain any credit under the consent dividends paid credit provisions.

Definition of personal holding company.—The term "personal holding company" is an arbitrary conception.

By section 501, it means any corporation at least 80 percent of whose gross income for the taxable year is personal-holding-company income with respect to any taxable year beginning after December 31, 1936, and 70 percent of whose

taxable income for any year thereafter is personal-holding-company income, and more than 50 percent in value of whose outstanding stock is owned directly or indirectly by or for not more than five individuals. The term "personal holding company," however, does not include a bank, life insurance company, a surety company, or a foreign personal holding company, or a licensed personal finance company.

The term "personal holding company income" means the portion of the gross income which consists of dividends, interest, royalties, annuities, except in the case of regular dealers in stocks or securities, gains from the sale or exchange of stock or securities, rents, mineral, oil, or gas royalties, in certain instances, and certain other types of income defined by statute.

History and background of provisions.—The history and background of the provisions with which we are dealing are as follows:

A good many years ago, in order to discourage the accumulation of earnings by corporations, Congress imposed surtaxes on corporations improperly accumulating surpluses.

The Revenue Act of 1934 retained the surtax on corporations improperly accumulating surpluses, but in addition it imposed new surtaxes on personal holding companies by way of what is called surtaxes on "undistributed subchapter A net income." This act also limited the deductibility of capital losses incurred, and allowed a deduction not to exceed $2,000 for net capital losses. This limitation was evidently designed to prevent taxpayers offsetting depression losses against taxable income. This $2,000 limitation applied to all taxpayers, corporations, personal holding companies, and individuals.

The 1936 Revenue Act continued the $2,000 limitation on capital losses which could be deducted by all taxpayers.

The 1938 Revenue Act removed this limitation as to individuals, but continued it as to corporations, including personal holding companies, so that they could, under this act, still deduct only $2,000 of capital losses. This act applied to 1938 and 1939 returns.

The 1939 Revenue Act amended the Internal Revenue Code in many particulars, effective and applicable for the 1940 calendar year. Section 117, which has to do with capital gains and losses, paragraph (d) was amended to read as follows:

"(d) *Limitation on capital losses.*—Long-term capital losses shall be allowed, but short-term capital losses shall be allowed only to the extent of short-term capital gains."

This paragraph (d), applied in computing the net income of corporations and individuals for the purposes of normal income taxes, is applicable to personal holding companies. But paragraph (d) was added to section 505, the effect of which is to disallow all capital losses in excess of $2,000 plus capital gains, in computing the surtax on the "undistributed subchapter A net income," as previously pointed out.

Typical and actual cases of inequality.—The effect of the statutory provisions hereinabove considered and referred to have been considered by us in our office in several cases. The following are typical (amounts are assumed):

1. In one case, the personal holding company had borrowed up to the limit on its marketable assets. It had to have money to pay the operating expenses of the corporation. It had some stock which was unpledged and which could be sold at a considerable loss but on which not enough money could have been borrowed to pay the operating expenses. Therefore the corporation sold this asset at a considerable loss. The following figures are assumed. The corporation had a net income under the provisions of the code of $15,000. It had a capital loss of $50,000. It could take only $2,000 of that loss which left a "subchapter A net income" of $13,000. It had no earnings or profits accumulated since March 1, 1913. In computing its "subchapter A net income," it was allowed to deduct only the $2,000, but in determining whether or not the corporation had any earnings or profits for the year, the total capital loss of $50,000 was deducted leaving a net loss of $35,000. The corporation therefore had no current earnings or profits to distribute. The corporation had a pre-March 1, 1913, surplus and it did in fact distribute more than its "subchapter A net income." This distribution, however, was not a dividend, and no "dividends paid credit" was allowed. There were no other deductions from the "subchapter A net income," and so that net income became the statutory "undistributed subchapter A net income" on which a tax of $9,350 was assessed.

The above therefore was a case where the corporation was obliged by the circumstances to incur a capital loss which it would not have voluntarily incurred otherwise.

2. In another case the taxpayer, a personal holding company, held stock in another corporation. It did not have the controlling interest in such other corporation. The other corporation liquidated, and because of the high basis of the stock in that corporation held by taxpayer, and the small value of the distribution received on liquidation, the taxpayer sustained a substantial capital loss which more than wiped out its earnings and profits for the current year. It had no accumulated earnings and profits. Here again, the capital loss was allowed only to the extent of $2,000 in figuring the "subchapter A net income"; the taxpayer had no earnings or profits to distribute and so could not get a "consent dividends credit"; and there was no other deduction to be made from the "subchapter A net income." Therefore, the "subchapter A net income" became the "undistributed subchapter A net income" on which the surtax was assessed.

The above was a case where the corporation had a capital loss forced upon it. This corporation also distributed much more than its entire income for the year.

3. The same situation has arisen where a corporation has an impairment of capital at the start of the year. It makes its profit during the year, but so much of the profit as is necessary to restore the capital impairment is treated as having been put back into the capital structure of the corporation, and only the balance is treated as earnings and profits available for distribution.

This, in turn, cuts the "dividends paid credit" to the excess of the earnings and profits over the impairment of capital, and although the corporation paid out more than its income for the year, the court held that only a part of that payment was a dividend.

Alternative methods of curing inequity.—We submit that the hardship and inequity should be eliminated, and we submit three alternative methods or formulas, in the order of our preference, by which the elimination could be accomplished:

First preference.—Amend section 505 by striking therefrom paragraph (d). The effect of this amendment would be to allow personal holding companies long-term capital losses in full and short-term capital losses to the extent of short-term capital gains as deductions in computing the surtax on the "undistributed subchapter A net income."

Second preference.—Section 23 (g) (1) reads as follows:

"Losses from sales or exchanges of capital assets shall be allowed only to the extent provided in section 117."

We propose that section 117 (d) be amended to read as follows:

"Long-term capital losses shall be allowed, but short-term capital losses shall be allowed only to the extent of short-term capital gains, except in the case of a personal holding company, as defined in section 501 (a), capital losses shall be allowed only to the extent of $2,000 plus capital gains."

Section 505 (d) provides:

"The net income shall be computed without regard to section 117 (d) and (e), and losses from sales or exchanges of capital assets shall be allowed only to the extent of $2,000 plus the gains from such sales or exchanges."

We propose, in connection with the above amendment of section 117 (d), that the above-quoted paragraph (d) of section 505 be stricken out, and that a new paragraph (a) (4) be added to section 505, to read as follows:

"The amount of capital losses not allowed as a deduction under section 117 (d)."

The effect of these amendments proposed under this second preference would be a penalty to a personal holding company by requiring it to pay a normal corporation income tax without any deduction for capital losses of more than $2,000, plus the gains from sales or exchanges of capital assets; but in the computation of the surtax on the "undistributed subchapter A net income," the personal holding company would be allowed to deduct all capital losses not allowed as a deduction under section 117 (d) (amended as proposed).

Third preference.—We propose that subsection (1) of section 27 be amended so as to read as follows:

"Except for the purpose of computing the undistributed subchapter A net income of a personal holding company, if any part of a distribution (including stock dividends and stock rights) is not a taxable dividend in the hands of

such of the shareholders as are subject to taxation under this chapter for the period in which the distribution is made, such part shall not be included in computing the basic surtax credit."

And we further propose that section 28 be amended by adding a subsection as follows:

"For the purpose of computing the undistributed subchapter A net income of a personal holding company, the basic surtax credit shall include amounts distributed to shareholders either from earnings or profits accumulated after February 28, 1913, or from any other source, provided that each shareholder of the corporation includes such distributions in his income-tax return for the year in question as taxable income; and shall also include a consent dividends credit equal to the total sum agreed to be included in the gross income of the shareholders by their consents filed under subsection (d) of section 28."

The effect of the amendments proposed under this third preference would be to give the personal holding company a consent dividends credit in computing its "Undistributed subchapter A net income," where distributions are made to its stockholders.

Efforts to have inequality eliminated.—We have, on numerous occasions, taken this matter up with the Treasury Department, with the legislative counsel of that Department, and with the office of the general counsel of the Bureau of Internal Revenue. We understand that other representatives of personal holding companies have likewise taken this matter up. We have been assured by the Treasury Department, by its legislative counsel, and by its general counsel for the Bureau of Internal Revenue, that the inequity of which we are now complaining is recognized, and that the same should be remedied. We submitted the matter to the Ways and Means Committee of the House. We understand that the Treasury Department is prepared to submit recommendations as to how the inequity should be eliminated, but we have not yet had access to such recommendations.

BRIGGS, GILBERT & MACCARTNEY,
Attorneys at Law,
By CHAS. W. BRIGGS.

Attached is schedule 1, containing verbatim copies of certain pertinent sections of the Internal Revenue Code.

SCHEDULE 1.—*Certain sections of Internal Revenue Code*

"Personal holding company income" as defined in the act does not enter into the computation of taxable income of a personal holding company (the tax being computed on the "undistributed subchapter A net income") but is purely a test to determine whether 80 percent of a corporation's gross income is of such nature as to bring it within the classification of a personal holding company.

In order to arrive at the "undistributed subchapter A net income" we start with the ordinarily taxable net income of the corporation.

The "subchapter A net income" is determined as follows:

"SEC. 505 (Internal Revenue Code). For the purposes of this subchapter the term 'subchapter A net income' means the net income with the following adjustments:

"(a) *Additional deductions.*—There shall be allowed as deductions—

"(1) Federal income, war-profits, and excess-profits taxes paid or accrued during the taxable year to the extent not allowed as a deduction under section 23; but not including the tax imposed by section 102, section 500, or a section of a prior income-tax law corresponding to either of such sections.

"(2) In lieu of the deduction allowed by section 23 (q), contributions or gifts, payment of which is made within the taxable year to or for the use of donees described in section 23 (q) for the purposes therein specified, to an amount which does not exceed 15 percentum of the taxpayer's net income, computed without the benefit of this paragraph and section 23 (q), and without the deduction of the amount disallowed under subsection (b) of this section.

"(3) In the case of a corporation organized prior to January 1, 1936, to take over the assets and liabilities of the estate of a decedent, amounts paid in liquidation of any liability of the corporation based on the liability of the decedent to make contributions or gifts to or for the use of donees described in section 23 (o) for the purposes therein specified, to the extent such liability of the decedent existed prior to January 1, 1934. No deduction shall be allowed under paragraph (2) of this subsection for a taxable year for which a deduction is allowed under this paragraph.

"(b) *Deductions not allowed.*—The aggregate of the deductions allowed under section 23 (a), relating to expenses, and section 23 (l), relating to depreciation, which are allocable to the operation and maintenance of property owned or operated by the corporation, shall be allowed only in an amount equal to the rent or other compensation received for the use of, or the right to use, the property, unless it is established (under regulations prescribed by the Commissioner with the approval of the Secretary) to the satisfaction of the Commissioner:

"(1) That the rent or other compensation received was the highest obtainable, or, if none was received, that none was obtainable;

"(2) That the property was held in the course of a business carried on bona fide for profit; and

"(3) Either that there was reasonable expectation that the operation of the property would result in a profit, or that the property was necessary to the conduct of the business.

"(c) *Net loss carry-over disallowed.*—The deduction for net operating losses provided in section 23 (s) shall not be allowed.

"(d) *Capital losses.*—The net income shall be computed without regard to section 117 (d) and (e), and losses from sales or exchanges of capital assets shall be allowed only to the extent of $2,000 plus the gains from such sales or exchanges."

The "undistributed subchapter A net income" is determined as follows:

"SEC. 504 (Internal Revenue Code). For the purposes of this subchapter the term 'undistributed subchapter A net income' means the subchapter A net income (as defined in section 505) minus—

"(a) The amount of the dividends paid credit provided in section 27 (a) without the benefit of paragraphs (3) and (4) thereof (computed without its reduction, under section 27 (b) (1), by the amount of the credit provided in section 26 (a), relating to interest on certain obligations of the United States and Government corporations); but, in the computation of the dividends paid credit for the purposes of this subchapter, the amount allowed under subsection (c) of this section or of section 405 of the Revenue Act of 1938 in the computation of the tax under this subchapter or under Title 1A of the Revenue Act of 1938 for any preceding taxable year beginning after December 31, 1937, shall be considered as a dividend paid in such preceeding taxable year and not in the year of distribution, and, in the computation of the dividend carry-over for the purposes of this subchapter, the term 'adjusted net income' as used in section 27 (c) means the adjusted net income minus the deduction allowed for Federal taxes under section 505 (a) (1):

"(b) Amounts used or irrevocably set aside to pay or to retire indebtedness of any kind incurred prior to January 1, 1934, if such amounts are reasonable with reference to the size and terms of such indebtedness;

"(c) Dividends paid after the close of the taxable year and before the 15th day of the third month following the close of the taxable year, if claimed under this subsection in the return, but only to the extent to which such dividends are includible, for the purposes of chapter 1, in the computation of the basic surtax credit for the year of distribution; but the amount allowed under this subsection shall not exceed either:

"(1) The accumulated earnings and profits as of the close of the taxable years; or

"(2) The undistributed subchapter A net income for the taxable year computed without regard to this subsection; or

"(3) 10 per centum of the sum of—

"(A) The dividends paid during the taxable year (reduced by the amount allowed under this subsection in the computation of the tax under this subchapter for the taxable year preceding the taxable year or, in the case of a taxable year beginning in 1939, by the amount allowed under section 405 (c) of the Revenue Act of 1938 in the computation of the tax under title 1A of such act for a taxable year beginning prior to January 1, 1939); and

"(B) The consent dividends credit for the taxable year."

The "dividends paid credit" is determined as follows:

"SEC. 27 (Internal Revenue Code). (a) *Definition in general.*—As used in this chapter with respect to any taxable year the term 'dividends paid credit' means the sum of:

"(1) The basic surtax credit for such year, computed as provided in subsection (b);

"(2) The dividend carry-over to such year, computed as provided in subsection (c);

"(3) The amount, if any, by which any deficit in the accumulated earnings and profits, as of the close of the preceding taxable year (whether beginning on, before, or after January 1, 1939), exceeds the amount of the credit provided in section 26 (c) (relating to net operating losses), for such preceding taxable year (if beginning after December 31, 1937); and

"(4) Amounts used or irrevocably set aside to pay or to retire indebtedness of any kind, if such amounts are reasonable with respect to the size and terms of such indebtedness. As used in this paragraph the term 'indebtedness' means only an indebtedness of the corporation existing at the close of business on December 31, 1937, and evidenced by a bond, note, debenture, certificate of indebtedness, mortgage, or deed of trust, issued by the corporation and in existence at the close of business on December 31, 1937, or by a bill of exchange accepted by the corporation prior to and in existence at, the close of business on such date. Where the indebtedness is for a principal sum, with interest, no credit shall be allowed under this paragraph for amounts used or set aside to pay such interest. A renewal (however evidenced) of an indebtedness shall be considered an indebtedness."

The "basic surtax credit" is determined as follows:

"SEC. 27 (Internal Revenue Code) * * * (b) *Basic surtax credit.*—As used in this chapter the term 'basic surtax credit' means the sum of:

"(1) The dividends paid during the taxable year, increased by the consent-dividends credit provided in section 28, and reduced by the amount of the credit provided in section 26 (a), relating to interest on certain obligations of the United States and Government corporations:

"(2) The net operating loss credit provided in section 26 (c) (1):

"(3) The bank affiliate credit provided in section 26 (d).

The aggregate of the amounts under paragraphs (2) and (3) shall not exceed the adjusted net income for the taxable year."

Section 27 (i), however, provides as follows:

"SEC. 27 (Internal Revenue Code) * * * (i) *Nontaxable distributions.*—If any part of a distribution (including stock dividends and stock rights) is not a taxable dividend in the hands of such of the shareholders as are subject to taxation under this chapter for the period in which the distribution is made, such part shall not be included in computing the basic surtax credit."

The "consent-dividends credit" is defined as follows:

"SEC. 28 (Internal Revenue Code). (a) *Definitions.*—As used in this section—

* * * * * * *

"(4) *Consent distribution.*—The term 'consent distribution' means the distribution which would have been made if, on the consent-dividends day (as defined in paragraph (3)), there has actually been distributed in cash and received by each shareholder making a consent, filed by the corporation under subsection (d), the specific amount stated in such consent."

* * * * * * *

"SEC. 28 (Internal Revenue Code) * * * (c) *Allowance of credit.*—There shall be allowed to the corporation, as a part of its basic surtax credit for the taxable year, a consent-dividends credit equal to such portion of the total sum agreed to be included in the gross income of shareholders by their consents filed under subsection (d) as it would have been entitled to include in computing its basic surtax credit if actual distribution of an amount equal to such total sum had been made in cash and each shareholder making such a consent had received, on the consent-dividends day, the amount specified in the consent."

The CHAIRMAN. Mr. A. W. Clapp, of Tacoma, Wash.

STATEMENT OF A. W. CLAPP, TACOMA, WASH., VICE PRESIDENT, WEYERHAEUSER TIMBER CO.

Mr. CLAPP. Mr. Chairman, and members of the committee. I have a statement. I do not intend to read it except in certain instances.

I would like to have it included in the record, if I may.

The CHAIRMAN. Yes, sir; we will be glad to have you include it in the record.

Mr. CLAPP. I am the vice president and general counsel of Weyerhaeuser Timber Co., a lumber company operating on the west coast. In making this appearance before the committee, I also represent some other companies, mostly lumber companies which are more or less related to each other.

We have no disposition to object to the substantial tax increases contemplated by the pending bill. It is not my purpose to discuss rates as such or the amounts to be raised from various sources, from individuals, from corporations, or by so-called excise taxes.

The subjects that I wish to discuss are only provisions that we think are inconsistent with what we conceive to be the true principles of taxation or those which inflict unjustifiable and unnecessary discriminations or hardships.

The first subject is the special 10-percent excess-profits tax imposed under the special rule proposed in section 201 of the pending bill. That was the subject covered by Judge Fletcher, representing the railroads, a few days ago; and I think possibly you gentlemen have heard objections to that particular tax from other taxpayers, and will.

To state it shortly, a proposal to tax the difference between the income, the average earnings of a corporation in the test years, and its invested-capital credit.

It applies only to corporations who use the invested-capital credit.

Now, in the present law, in the excess-profits-tax law of 1940, there are two methods of computing your excess-profits credit. We agree that there should be those two methods.

The policy of allowing the average-earnings credit was based upon the belief of Congress that it was unfair to tax income or any earnings beyond those earnings which, you might say, normally, in the test years, the corporation had made. Congress might have stopped with the provision for the average-earnings method.

That average-earnings method, however, was and still is the more controversial of the two methods; but Congress did not stop with providing the average-earnings method.

It did provide, because it knew there were some corporations, there were very many corporations, which in the test years may have had no profits, or may have had very few profits, that until the corporation had earned in the current year a certain percentage upon its invested capital, which was 8 percent in the original law, it should not pay excess-profits taxes because it would not be considered to have excess profits.

As I say, we believe that there should be the two methods of computing the excess profits granted. What we do object to, and we do object most strenuously, is to be asked to pay a 10-percent tax really as a penalty upon our failure to earn in the test years 8 or 7 percent upon our invested capital. To tax the difference between nothing, in many thousands of cases, or 1 or 2 or 3 percent, on your invested capital, and 8 or 7 percent is wholly illogical and inconsistent with the permitted invested-capital method.

We are given with one hand this invested-capital method, the right to earn 7 or 8 percent upon our invested capital, and with the other hand it is wholly or partly taken away from us.

Senator CONNALLY. Are you referring to the defense tax of 10 percent?

Mr. CLAPP. No; I am referring to the special tax in this bill, which is now in section 201 of this bill under what they call a special rule.

Senator CONNALLY. I see.

Mr. CLAPP. Now, this proposed 10-percent tax will affect and penalize practically all railroads, I am sure 99 percent of all lumber companies, practically all coal companies, a large majority of mining companies, to name only some of the classes of industry. It will not only affect and penalize them but it will penalize any corporation which, for any reason, had, in the test years, less than 7- or 8-percent earnings upon its invested capital. There are thousands—there must be thousands and thousands—of retail stores, department stores, all kinds of businesses, whether large or small, whether they are participating either directly or indirectly or not at all in what we call the defense program.

Because I represent lumber companies I would like to give you some statistics which will indicate the effect of this 10-percent tax on the Douglas-fir industry. The Douglas-fir industry is in the western part of Washington and Oregon. They produce approximately 30 percent of all the softwood lumber that is produced in the United States.

The general statements I will make are based upon statistics contained in a publication called the Douglas Fir Industry, a study undertaken by Dr. Dexter M. Keezer for the Bureau of Research and Statistics of the Advisory Commission of the Council of National Defense.

On pages 25 to 41, inclusive, he discusses the financial history of the industry, of the Douglas-fir industry. It clearly appears—and I have given the citations of the document in my statement—that for the industry as a whole the total earnings of the industry were such that the total average earnings of the base years, counting a heavy-loss year, 1938, as zero, could not have exceeded $4,500,000 upon a total apparent invested capital as of 1937—capital, surplus, and 50 percent of borrowed capital—of approximately $292,000,000, or an average of 1.54 percent.

I am sorry to say, after my statement was prepared I found that whereas in the statement of earnings there were included some 414 companies, in the statement of their capitalization were included only 391, so it is probable that this average of 1.54 percent is too small.

There are, of course, high-cost and low-cost, well-managed and poorly managed companies. It is a moral certainty that of the hundreds of companies whose financial histories were analyzed by Dr. Keezer, a very large majority of them had no earnings in any of the base years excepting possibly 1937 and would have no average earnings or practically none.

In other words, they would have to pay 10 percent on their earnings of this year even though they earned only 4 or 5 percent.

These statistics they have given you are general statistics. I can and will give you the results of particular companies that I know of and represent.

These are four lumber companies in the Douglas-fir region, those that I read, that are well-managed and are among the lower cost operations.

One had average earnings in the test period amounting to 2.25 percent of invested capital and another 2.05 percent, another approximately 4 percent, and the fourth, 8.21 percent.

This last company is a comparatively small company, operating in a very fine quality of timber with exceptionally favorable operating conditions.

Judge Fletcher said the other day that there were only several—I do not know whether he said three or four—of the railroad companies in the United States which could use the average-earnings method. Now, here is one company, and it is my judgment, I am quite sure, that it may be the only lumber company in the Douglas-fir region that can elect to compute its excess-profits tax under the capital-earnings method.

In other words, it would be the only company that would not be subject to this 10-percent tax.

Earnings in the Douglas-fir industry in 1940 were greatly improved, though few companies, and none of the four I have referred to, earned enough to pay an excess-profits tax.

Present prospects for 1941 are that many lumber companies will earn enough to pay the graduated excess-profits tax. Those which I represent and, I am sure, all in the Douglas-fir industry are willing to pay the tax on all earnings over the 8- or 7-percent credit, willing to pay, along with our more fortunate brothers who use the average-earnings credit, whatever rate the Congress finds necessary to collect from corporations; but we do object most emphatically to paying a tax on earnings which are not excessive by any standard.

Of the four I have mentioned two will pay a very substantial graduated excess-profits tax.

Senator CONNALLY. On the invested-capital method?

Mr. CLAPP. Yes; on the invested-capital method.

Senator CONNALLY. All right.

Mr. CLAPP. Of course, we can only guess what the remainder of the year will be, but on computations we make at present one will pay over $4,000,000 of the graduated excess-profits tax.

I do not want you gentlemen to think that we are trying to get out of anything, out of paying the excess-profits tax; it is not that. We are not arguing as to what the rates on excess-profits tax shall be; we are willing, and I am sure that all of the lumber industry is willing, to pay our share of excess-profits taxes.

Senator WALSH. Is that $4,000,000 estimated on the taxes under the present law?

Mr. CLAPP. I should have said it is estimated on the House bill, and, of course, we have had to estimate what our earnings will be; but, as nearly as I can figure it, it will be over $4,000,000.

Senator WALSH. Have you estimated what it would be under the present law, assuming there is no change?

Mr. CLAPP. It probably would be around—we did not estimate it but we imagine it would be around $2,000,000. You see, there is really a 10-percent increase in the rate and then, instead of getting 8 percent on invested capital, we get somewhat less than 8 percent because some of our invested capital is in the 7-percent class.

Our next proposition is that the graduation of rates should be based not on dollar amounts of adjusted excess profits but largely upon the percentage which those profits bear to the excess-profits credit.

Mr. Sullivan, of the Treasury Department, in his second appearance before the Ways and Means Committee, recommended that. Of course, in his second appearance he recommended an excess-profits tax based upon invested capital and without the average-earnings method, and he proposed that the rate of tax be based upon the percentage which the company in the current year made on its invested capital. That was the 1918 excess-profits-tax law.

Well, whether you have one method or two, what we say is that the rates of tax should be based upon the extent to which the profits are excessive. If a corporation, with the average-earnings method, makes 200 percent or 300 percent of its average earnings, it should pay a higher rate of tax than the corporation with the same adjusted excess-profits income but whose increase in its earnings and whose excessive earnings are only 9 or 10 percent.

As it is at present, the corporation that only increases its earnings 9 or 10 percent will pay, in certain brackets, more than the corporation which has made two or three times as much as its previous earnings.

At the bottom of page 5 of my statement I have given an illustrative schedule as to how rate brackets might be constructed.

In doing that I have assumed—I do not know that it is necessary to assume—that Congress might continue to favor the smaller companies, so that the schedule that I have is constructed on the principle of making the lower rates apply on the dollar amounts of adjusted excess profits; but when you get into the higher amounts they are adjusted on the basis of the percentage which you adjusted excess profits bear to your excess-profits credit, which, in the case of the average-earnings method, is the average earnings in the test years.

Senator CONNALLY. You mean by that if a company made an average over the 4 years of $100.000 and now makes $200,000 that that extra $100,000 ought to be the basis of the tax?

Mr. CLAPP. We will take two companies, each one of which made $100,000 in the base years.

Senator CONNALLY. Yes.

Mr. CLAPP. Now, in the current year one of them makes $200,000.

Senator CONNALLY. Yes.

Mr. CLAPP. And the other makes $110,000.

Senator CONNALLY. Yes.

Mr. CLAPP. In the higher brackets, at least, the company which has only increased slightly should pay a lesser rate of tax.

Senator CONNALLY. That is what I was getting at.

Mr. CLAPP. Yes.

Senator CONNALLY. You figure the one that makes $200,000 is making 200 percent compared to what it made during the base period and therefore it ought to bear a heavier rate than the company that only makes 10 or 15 or 25 percent more; is that your theory?

Mr. CLAPP. Yes. That was the theory of the 1918 excess-profits-tax law and it was, as I said, recommended by Mr. Sullivan in his second appearance before the Ways and Means Committee.

I have an illustrative schedule, starting at the bottom of page 563, which will illustrate what I mean. Of course, we cannot suggest what the rates of these brackets shall be; they will have to be fixed and the brackets themselves will have to be fixed by experts so that the Congress may receive as much revenue as it desires from the excess-profits tax.

The CHAIRMAN. What you wish for is a percentage rather than a flat dollar?

Mr. CLAPP. Yes. At least when you get beyond $50,000 or $25,000. I do not know that it is necessary to have any exemption from the percentage rate for even the small corporation, if it doubles its earnings and another one just the same size and with the same record in the test years has only a 10-percent increase, why, in that case, even as between the small ones I think that the rates should be different.

The CHAIRMAN. The rate is different. It is broken down now on the dollar basis.

Mr. CLAPP. That is true, up to $500,000.

The CHAIRMAN. But the theory of our excess-profits tax, Mr. Clapp, is simply this, that when you get above the credit, whatever your credit is, everything is excess profits, and by breaking it up on a dollar-bracket basis you do aid the smaller corporations, you do assist them; that is the theory, whether you would agree with it or not.

Mr. CLAPP. In my proposal you find that I have, up to the point where the adjusted excess profits reach $50,000, based it upon the dollar in order to take care of the small fellow.

I do not think you need go beyond that in this kind of a plan.

The CHAIRMAN. The Senate agreed with you on that point when we passed the excess-profits tax but in conference we were not able to prevail against the House, so we have this other system now; and that is the theory of it.

Once you have had full benefit of your credits, whether you are on the average-earnings basis or whether you are on the invested-capital basis, anything above that in the way of earnings is excess profits, and without regard to the percentage involved you simply break it up in taxes, so much up to $25,000, so much after $25,000, and, in this bill, 60 percent after $500,000.

Mr. CLAPP. I understand, of course, the position that the Senate took. I think it was correct.

It is just as simple to base your rates upon percentages to your excess-profits credit as it is to base them upon dollars.

The CHAIRMAN. Just the other view, though, prevailed.

Mr. CLAPP. What I am making is a plea that the other view now be discarded and that we start on the right principle. The real principle, it seems to me——

Senator VANDENBERG. You just want the Senate to revert to its own wisdom?

Mr. CLAPP. Exactly, Senator Vandenberg. I have given an illustration of two rather large companies. That is on page 6.

Each of the companies makes an adjusted excess-profits income of $2,200,000. Of course, I am not interested in any such corporation as corporation B, which is a pretty large corporation, but you will notice that on the same excess-profits income the same tax is paid by each corporation, although one of them has earned 22 percent on its invested capital and the other one only 7.75 percent.

Senator CONNALLY. You mean they paid the same rate?

Mr. CLAPP. Yes; paid the same tax.

Senator CONNALLY. Is that right?

Mr. CLAPP. Yes, sir.

The first one has made 300 percent, if it is on the average-earnings basis, of its average earnings; and the second one has made only 109 percent. In other words, it has increased only 9 percent.

The first one may be profiteering; the second one, the fluctuation of its income may be only a normal fluctuation. I say that first corporation should pay a higher rate of tax than the other corporation.

Now, of course, the other corporation, corporation B in this example, is a very large corporation; it has enough money to pay the tax so it may be said, "Well, it has got that big income; it can afford to pay the tax."

I hope that the Congress is not going to allow the mere bigness of corporations to affect it in prescribing corporation rates. I think Congress has gone far enough in differentiating the corporations who have an income under $25,000 from those who have over that, and the reason that Congress has not, in fact, placed a graduated surtax upon corporations is, I assume, the well-known fact that it is the stockholder of the corporation who bears the corporation tax, not the corporation; the corporation hasn't anything; the crporation pays it but it is the stockholder who bears it. In my statement I have given some statistics which may or may not be appropriate, contained in Monograph 29, compiled as of December 31, 1937, in Investigation of Concentration of Economic Power, the Temporary National Economic Committee.

Now, from that it appears that in the 200 largest nonfinancial corporations of the country there were 948,000,000, in round figures, shares of equity stock. These were held in 7,026,793 shareholdings which averaged only 135 shares per holding.

In these same 200 corporations there were 6,189,709 shareholdings each of 100 shares or less. The shares so held were 167,144,000, or an average of 27 plus shares per holding.

The average market value of each one of these holdings averaging 27 plus shares was $931 plus.

Of the total of 7,026,000 shareholdings in the same 200 corporations, 6,689,000, or 95.2 percent, had a market value of less than $10,000 each; and the average annual income from holdings of $10,000 would probably be not over $600.

Now, it is apparent that these smaller shareholdings are those of individuals in the lower and lower-middle income brackets. I know of no statistics with reference to the size of average shareholdings in corporations smaller than the 200 largest nonfinancial corporations that I have referred to but I think it can be said with confidence that there is no such proportion of small shareholdings of the size mentioned in medium-sized or even smaller corporations. The fact is that many millions of our people, desiring to invest part of their money in equity stocks, naturally go to the stock market to buy and, quite as naturally, invest in the better-known stocks.

Of the 200 corporations referred to above, the common stocks of all but 21 are listed on a national exchange.

I wonder if I could be excused for just a moment and resume in just an instant?

The CHAIRMAN. Certainly.

Senator DANAHER. Mr. Chairman, before you take up something else I would like to ask a question which somebody here perhaps can answer. I think it is pertinent and it will fill in this interim.

The CHAIRMAN. Yes, Senator.

Senator DANAHER. Is there anybody representing the Treasury who can explain why they should permit deduction of interest paid on a deficiency for an open year and deny the deduction of interest paid on a deficiency for a closed year?

Mr. RAY. Senator, that sounds to me like a special point and I would like to take that under consideration and prepare a reply in answer to Senator Danaher.

The CHAIRMAN. If you will, furnish that to Senator Danaher. Get his exact question and furnish him that information.

Senator DANAHER. It relates to what will be brought up presently anyhow. I thought perhaps if we had the explanation of the Treasury in the meantime we could follow more intelligently what is coming.

Mr. CLAPP. May I proceed?

The CHAIRMAN. Yes; Mr. Clapp.

Mr. CLAPP. The third proposition relates to the allowance of deduction, in computing excess-profits income as well as net income for normal and proposed surtax, of interest paid on adjustments made under section 734 of the Internal Revenue Code.

A few days ago, I think it was Tuesday, a gentleman from Boston, Mr. Blodgett, appeared and discussed section 734, its administration, and its effect. I am not going into a discussion of section 734 except with respect to one point.

Now, that section provides, in effect, that if a taxpayer, in computing its excess-profits-tax liability, takes a position inconsistent with that taken in an income return in a prior year which is not open, so that a deficiency may be assessed, it must, nevertheless, in making its excess-profits return, adjust the return of the prior year to make it consistent with the position taken in the current year, and add to its excess-profits tax any additional income shown for the prior year, with interest at the rate of 6 percent per annum.

Now, a good illustration is this: My company in 1927 sold to another wholly unrelated company a large block of timber under an installment contract. In 1933, in the depths of the depression, my company had to cancel the contract and take the timber back.

The timber had been sold on an installment contract. At that time the Commissioner had certain regulations with reference to the computation of profit or loss upon the cancelation of an installment contract, and we meticulously followed that regulation, and followed it because we felt it was in consonance with the law.

Just within about 2 years the courts have decided that the Commissioner was entirely wrong in the regulation, that the regulation did not conform with the law, and the courts laid down the correct rule for ascertaining the income or the profit to be accounted for by the cancelation of an installment contract.

Well, under the rule as laid down by the courts, we had understated income in making our 1933 return. Although we had followed the regulations of the Commissioner, we had understated the profit on the taking of that timber by considerably over $1,000,000.

If we had known what the correct rule was, if we had had the courts' decision at that time, we could have included it in our income for 1933 and paid the taxes on it. I might say that the Commissioner accepted that decision and changed his regulations.

But, of course, the year 1933 was closed; the Commissioner had no right to make any deficiency assessment.

Now, in computing our invested capital for 1940 we want to include that $1,000,000 or more profit as profits, of course; it was profits according to the true rule and it is a part of our earnings and profits and therefore a part of invested capital.

But when we do that we have to go back and figure what our tax would have been in 1933, what we should have paid in 1933, and any deficiency that we did not pay we have to add to our excess-profits tax, together with interest at the rate of 6 percent from the time when we should have paid, in 1933 or 1934.

Now to that we do not object. It is fair that if we want to have the advantage of an invested capital on that profit which we did make in 1933, we could go back and pay the tax which we should have paid in 1933, together with interest.

We have no objection to that. But under the law as it is drawn, the way in which it is drawn, and I think perhaps it is inadvertent, we cannot figure out that there is for us any deduction of the interest that we paid.

Now, of course, we are not entitled to deduct this back tax that we paid, but in all other cases where there are deficiencies the law provides that we may deduct the interest from our income for the current year; or if there is a refund, we must add the interest.

Universally, so far as I know, that has always been the rule on deficiencies.

Now, that is all this is. Although it is a calculation, it is not called a deficiency; it is a calculation of what we should have paid in that prior year, which is closed. To that we add the interest; and the whole we add to our excess-profits-tax assessment.

We think we should be entitled, as we always have been in the cases of deficiencies, to a deduction for interest; not for all back taxes, but for the interest that we paid.

The principle of section 734 with respect to income-tax returns has been in the law as section 3801 of the Internal Revenue Code for, I think, 3 years. In other words, as applied to income-tax returns, if you take a position which is inconsistent with that you took in prior returns you must go back or the Commissioner can go back—he can go back, however, only to 1932—and assess a deficiency for whatever the tax might appear if you had maintained the same position in that prior year that you now wish to make it. So in that case it simply is a case of the assessment of a deficiency and you pay that deficiency and you pay interest, but you have a deduction for the interest that you pay, and even under section 734 it applies only to closed years. In other words, if the position which we now take is inconsistent with the position which we took in 1938 or 1939 this section does not, of itself, apply; the Commissioner there has the right to, and he does, go back and assess you the additional income tax, and you pay the interest and you have a deduction for the interest.

The CHAIRMAN. That is the point of your complaint, is it?

Mr. CLAPP. That is the point of my complaint. We want a deduction for that interest that we paid; and that is the only point we complain of.

The CHAIRMAN. On the face of it, it looks like your complaint is very well founded. I think the Treasury ought to make a special note of that——

Mr. RAY. Yes, Senator George.

The CHAIRMAN. And see how that may be remedied.

Mr. RAY. The Treasury is considering this particular section with respect to that point and a number of other points. It is a very specialized problem, and we will look into it, sir.

The CHAIRMAN. Yes.

Senator DANAHER. Mr. Chairman, in that case he need not write me particularly and specifically, because that is the very point I had in my question. I think he is right.

Mr. CLAPP. Just one word with respect to the capital-stock tax.

Judge Fletcher said the other day—this is the capital-stock tax and has nothing to do with the excise tax. We have no objection or, at least, are not going to object to the increase in the rate; but, as Judge Fletcher pointed out the other day, this capital-stock-tax law, together with the accompanying excess—what they call the declared-value excess-profits taxes—were deliberately drawn so as to force the taxpayer to declare enough and pay on a value for his capital stock so he would not be liable for the declared-value excess-profits tax.

Now, in normal times, and usually, the rule has been that you have to declare for 3 years. I think in 1939 there was a special rule made that in 1939 and 1940 you could increase your declared value but not decrease it. In ordinary times it may be all right for the poor taxpayer to try to calculate what his income may be for the next 3 years, but here we have a year which, in my judgment, is a high-profit year, and we must declare a value high enough to protect us with respect to our income or earnings for 1941.

Now, if there should be a cessation of war by a negotiated peace or otherwise in 1942 or 1943 my judgment is that the profit liability in 1941 is just going to disappear and we will be paying capital-stock taxes on a valuation enormously in excess of that which we need to protect ourselves against the earnings.

On the other hand, of course, something else may occur.

There is a mild—it may be that the word "mild" should not be used—there is a mild tendency toward inflation. Now, suppose we have an inflation which progressively appears in 1942 and 1943.

Our profits—although the dollar value, the real value, may not be as much—but measured in dollars our profits may just jump enormously, and we have declared our value now on the basis of the present value of the dollar, and we may just simply have to pay enormous amounts of declared-value excess-profits taxes.

Senator WALSH. Your position is the same as the position of Judge Fletcher on that?

Mr. CLAPP. Yes. We should have each year, in these abnormal times, the right to make a new declaration either up or down.

I thank the committee.

The CHAIRMAN. How would it appeal to you to increase your normal taxes sufficient to take care of the capital-stock taxes and write the capital-stock tax out of the law? Or would you want to think on that?

Mr. CLAPP. I would want to think on that. As far as my own clients are concerned, I am inclined to think we would be in favor of it. It is pretty hard to figure. I would not like to make a statement on it.

The CHAIRMAN. Thank you very much.

(The statement submitted by Mr. Clapp is as follows:)

STATEMENT OF A. W. CLAPP ON THE 1941 REVENUE ACT

I am vice president and general counsel of Weyerhauser Timber Co., of Tacoma, Wash. In making this appearance, I represent that company and a number of other companies more or less related to it.

We have no disposition to object to the substantial tax increases contemplated by the pending bill. It is not my purpose to discuss rates as such, or the amounts to be raised from various sources—from individuals, from corporations, or by so-called excise taxes. I shall attempt to discuss only certain provisions and features of the bill which seem to be inconsistent with basic principles of taxation or to result in unjustifiable discrimination or hardship.

THE EXCESS-PROFITS TAX

1. The 10-percent excess-profits tax imposed under the special rule proposed in section 201 of the pending bill

The 10-percent tax applicable to those who elect the invested-capital method, and measured substantially by the excess of adjusted-excess-profits income if the average-earnings method were to be used, over adjusted-excess-profits income computed by the invested-capital method, is, we insist, illogical, unfair, and discriminatory. It imposes a severe and unfair burden on all corporations who were unfortunate enough to have relatively small (in many cases no) average profits during the years 1936-39.

The excess-profits-tax law of 1940 provides two methods of computing the excess-profits credit, and the pending bill retains the two methods. The policy of allowing the average-earnings credit was based on the belief that no matter how large were the average profits of a corporation during the base period, it was unfair to impose upon it an excess-profits tax unless its earnings in the current year exceeded those average earnings.

Congress might have stopped with the provision for the average-earnings method, although that method was and still is the most controversial of the two methods. But it did not, and why? Because it was, in 1940, well known that there were many corporations which, in the base years, were without any substantial earnings. Many industries and types of businesses made no substantial recovery from the depression years. This was notably true of the durable-goods industries, and particularly true of the building industries. And so, because this was an excess-profits tax—a tax on profits which are excessive, measured by some reasonable standard—a corporation which did not make an average of 8 percent on its invested capital during the base period was permitted an excess-profits credit of that amount. In the present bill, that percentage is 8 percent on the first $5,000,000 of invested capital and 7 percent on all above $5,000,000.

We have no objections to the use of the two methods; we think there should be two methods. We are not objecting to the percentage allowed in computing the excess-profits credit under the invested-capital method. But we do object most strenuously when asked to pay a 10-percent tax as a penalty for our failure to earn 8 percent or 7 percent in the base period. To tax the difference between nothing (in many thousands of cases) or 1 percent or 2 percent or 3 percent, and 8 percent or 7 percent on invested capital, is wholly illogical and inconsistent with the permitted invested-capital method. We are given the latter with one hand, and it is taken away, wholly or partly, by the other hand.

This new proposed 10 percent additional excess-profits tax will penalize practically all railroads, 99 percent of all lumber companies, practically all coal companies, a large majority of mining companies, to name only some of the classes of industries; in addition, many department stores, retail stores, and other businesses, large and small, those participating directly in the defense program, those indirectly, and those not at all.

Because I represent lumber companies, let me give you some statistics which will indicate the effect of this 10-percent tax on the Douglas-fir industry. General statements are based on statistics contained in the Douglas Fir Industry, a study undertaken by Dr. Dexter M. Keezer for the Bureau of Research and Statistics of the Advisory Commission to the Council of National Defense. On pages 25 to 41, inclusive, he discusses the financial history of the industry. It clearly appears (Keezer, pp. 26, 39) that for the industry as a whole, the total earnings of the industry were such that the total average earnings of the base years—counting a heavy loss year, 1938, as zero—could not have exceeded $4,500,000 upon a total apparent invested capital as of 1937—capital, surplus, and 50 percent of borrowed capital (Keezer, p. 33)—of approximately $292,000,000, or an average of 1.54 percent. Now there are, of course, high-cost and low-cost, well-managed and poorly managed companies. It is a moral certainty that of the hundreds of companies whose financial histories were analyzed by Dr. Keezer, a very large majority of them had no earnings in any of the base years, excepting possibly 1937, and would have no "average earnings," or practically none.

I represent four lumber companies in the Douglas-fir region. All are well managed and among the lower-cost operations. One had "average earnings" amounting to 2.25 percent of invested capital, another 2.05 percent, another approximately 4 percent, and the fourth 8.21 percent. This last company operates in fine-quality timber, with exceptionally favorable operating conditions. My judgment is that it may be the only lumber company in the Douglas-fir region who can elect to compute its excess-profits credit under the average-earnings method.

Earnings in the Douglas-fir industry in 1940 were greatly improved, though few companies (none of the four I have referred to above) earned enough to pay an excess-profits tax. Present prospects for 1941 are that many lumber companies will earn enough to pay the graduated excess-profits tax. Those whom I represent, and I am sure all in the Douglas-fir industry, are willing to pay the tax on all earnings over the 8-to-7-percent credit, willing to pay, along with our more fortunate brothers who use the average-earnings credit, whatever rates the Congress finds necessary to collect from corporations; but we do object most emphatically to paying a tax on earnings which are not excessive by any standard.

2. The graduation of rates should be based not on dollar amounts of adjusted excess profits, but largely upon the percentage which those profits bear to the excess-profits credit

The present law in providing for progressive rates of tax on brackets measured merely by the dollar amount of adjusted excess profits is unfair, inequitable, and seems to violate the principle of excess-profits taxation. Brackets should be based on the percentages by which income is excessive (as in the 1918 law) and not on the dollar amount of the excess profits. If it is desired to continue to favor or protect the smaller corporations, the Congress might base the lower rates upon dollar amount of adjusted excess profits—but not beyond $50,000, as that certainly is all that is necessary to protect small corporations; then bracket progressive rates on the remainder of the adjusted excess profits in accordance with the percentages which such remainder bears to the excess-profits credit. The following suggestion is illustrative only; the percentages and rates to be adopted to raise the necessary revenue must be worked out by experts:

Rate brackets

____ percent tax on dollar amount of adjusted excess profits up to $20,000.
____ percent tax on dollar amount of adjusted excess profits between $20,000 and $50,000.
____ percent tax on amount of adjusted excess profits (minus $50,000) which is 50 percent or less of excess-profits credit.

---- percent tax on amount of adjusted excess profits (minus $50,000) which is more than 50 percent and up to 100 percent of excess-profits credit.

---- percent tax on amount of adjusted excess profits (minus $50,000) which is more than 100 percent and up to 150 percent of excess-profits credit.

---- percent tax on amount of adjusted excess profits (minus $50,000) which exceeds 150 percent of excess-profits credit.

The rates on the last two brackets could, if necessary, be higher than any yet suggested.

We suggest that the bracket percentages be of the excess-profits credit (as above) rather than of invested capital (as in the 1918 law), because such a plan is applicable to those whose credit is based upon average earnings as well as to those using the invested-capital method.

To illustrate what seems to us to make the present method of bracketing inequitable, consider the following comparisons between two corporations, both large, but one much larger than the other.

	Corporation A	Corporation B
Invested capital	$15,000,000	$300,000,000
Excess-profits income	3,300,000	23,265,000
Excess-profits credit	1,100,000	21,065,000
Adjusted excess-profits income	2,200,000	2,200,000
	Percent	*Percent*
Percent of excess-profits income to invested capital	22	7.75
Percent of same to excess-profits credit	300	109.45
Tax under House bill	$1,274,000	$1,274,000

While the above illustration is given on the basis of an adjusted capital credit, exactly the same result occurs and exactly the same principle is involved if their respective excess-profits credit is computed under the average earnings credit.

The chances are that corporation A is profiteering. It may be that the increase in corporation B's income is but a normal fluctuation. We say that a corporation whose current earnings are only 9.45 percent over normal should not pay as much excess-profits tax on the same adjusted excess profit as a corporation whose current earnings are 200 percent in excess of its normal. Such a result seems to us to be totally inconsistent with the purpose and the principles of the excess-profits tax, whether it be considered an excess-profits tax or a war-profits tax.

Again, only for purpose of illustration, and well aware that rates and percentages in the illustrative schedule given above must be determined by the experts so as to produce the desired amount of revenue, if we use as rates of tax 35, 40, 50, 60, 65, and 70 percent, respectively, for the six brackets in that schedule, corporation A in the above illustration would pay excess-profits taxes of $1,331,560, and corporation B $1,094,000. We submit that such a result is more consonant with the purposes of the excess-profits tax.

But it may be said that corporation B is so big, its earnings so large, that it can afford to pay. Of course, other illustrations could be given of medium-size corporations and comparisons between two corporations of the same size, one with enormous profits over its normal and the other with but a slight increase. We say that, in every such case, the bracketing of rates should favor the latter.

We earnestly hope that the Congress is not going to allow the mere bigness of corporations to affect it in prescribing corporation rates. Aside from the difference in normal rates (and the proposed surtax rates) as between corporations with less and more than $25,000 net income, the Congress has not discriminated between the large and the small corporation, undoubtedly because of a realization that it is the stockholder who bears the burden of the corporation tax.

Congress should not forget the millions of investors in equity stocks, most of them in the largest corporations. It is not true that our large corporations are composed exclusively of a group of wealthy stockholders and the medium size and small corporations exclusively of a group of stockholders with income in the middle or lower brackets.

Consider the following statements (statistics compiled as of December 31, 1937, in Investigation of Concentration of Economic Power, Temporary National Economic Committee, Monograph 29):

In the 200 largest nonfinancial corporations in the country there were 948,717,572 shares of common (equity) stock outstanding. These were held in 7,026,793 shareholdings which averaged only 135 shares per holding.

In these same 200 corporations there were 6,189,709 shareholdings each of 100 shares or less. The shares so held were 167,144,681, or an average of 27+ shares per holding.

The average market value of each one of these holdings averaging 27+ shares was $931+.

Of the total of 7,026,793 shareholdings in the same 200 corporations, 6,689,235, or 95.2 percent, had a market value of less than $10,000 each, and the average annual income from holdings of $10,000 would probably be not over $600.

Total shareholdings of common stock of United States Steel Co. were 167,740. Of these shareholdings, 1,396 were of over 500 shares, and represented 46 percent of the outstanding stock; 166,344 shareholdings were of 500 shares or less, and represented 54 percent of the outstanding stock; and of the latter shareholdings 158,625 were of 100 shares or less, and represented 34.9 percent of the outstanding stock.

Total shareholdings of common stock of American Telephone & Telegraph Co. numbered 641,308. Of these shareholdings, 2,478 were of over 500 shares, representing 21.2 percent of the outstanding stock; 638,830 shareholdings were of 500 shares or less, representing 78.8 percent of the stock; and of the latter shareholdings, 614,383 were of 100 shares or less, and represented 53.9 percent of the outstanding stock.

Now it is apparent that these smaller shareholdings are those of individuals in the lower and lower-middle income brackets. I know of no statistics with reference to the size of average shareholdings in corporations smaller than the 200 largest nonfinancial corporations above referred to. But I think it can be said with confidence that there is no such proportion of small shareholdings of the size above mentioned in medium-sized or even smaller corporations. The fact is that many millions of our people, desiring to invest part of their money in equity stocks, naturally go to the stock market to buy, and, quite as naturally, invest in the better-known stocks. Of the 200 corporations referred to above, the common stock of all but 21 are listed on a national exchange.

3. Allowance of deduction in computing excess-profits income (also net income for normal and proposed surtax), of interest paid on adjustments made under section 734, Internal Revenue Code

Section 734, Internal Revenue Code, provides in effect that if a taxpayer, in computing its excess-profits-tax liability, takes a position inconsistent with that taken in an income return in a prior year which is not "open" so that a deficiency may be assessed, it must nevertheless, in making its excess-profits return, adjust the return of the prior year to make it consistent with the position taken in the current year, and add to its excess-profits tax any additional income shown for the prior year, with interest at the rate of 6 percent per annum.

A good illustration is this: My company, in 1927, sold to another wholly unrelated company a large block of timber under an installment contract. In 1933, in the depths of the depression, my company had to cancel the contract and retake the timber. The Internal Revenue Bureau had regulations providing for computation of profit (or loss) on the cancelation of such an installment contract. My company, in making its income-tax return for 1933, followed the Bureau's regulations, and with what at that time it believed to be the law. Recently the courts have decided that the regulation was not in accordance with law, and have laid down the correct rule for computing profit under the law in force in 1933 in cases of cancelations of installment contracts. The court's decision was followed by the Commission, who now has regulations which embody it. Under this correct rule we should have returned and paid for 1933 a tax on a profit of over a million dollars more than we did. But the year 1933 was "closed" when the court decisions were made.

Now, in making our 1940 excess-profits-tax return, we are including the profit which, under the correct rule, we made in 1933, in our surplus account as part of invested capital. But as that position is inconsistent with that taken by us in our original return for 1933, we must, under the provisions of section 734, recompute our tax for 1933 and now add to our excess-profits tax the tax we should have paid for 1933, together with interest at the rate of 6 percent per annum

from the date when it should have been paid. To all of this we have no objection. It is fair that we should pay this deficiency and interest if we desire to include the untaxed profit in our invested capital.

But the law as now written, as we understand it is interpreted by the regulations, does not allow us to deduct the interest which we will have to pay from our earnings either of 1940 or any other year. This is the first instance, to my knowledge, that taxpayers have not been allowed to deduct the interest paid on income-tax deficiencies. Heretofore, under all income-tax laws, interest on deficiencies has been a deductible item, and interest on refunds an addition to gross income.

The principle of section 734 has, with respect to inconsistent positions taken by the taxpayer (or by the Commissioner) in income-tax returns for subsequent years, been in the code for several years as section 3801, Internal Revenue Code. Deficiencies or overpayments for years as far back as 1932 (but not prior), even though the years are "closed" so that the statute of limitations precludes additional assessments or refunds, may be determined under circumstances similar to those covered by section 734, and deficiencies for prior "closed" years assessed, with interest, or refunds made, with interest. Interest on deficiencies is deductible in ascertaining net income, and interest on refunds included in gross income.

Furthermore, adjustments under section 734 apply only to years which are "closed." If a position taken in making excess-profits-tax returns is inconsistent with that taken in an income-tax return for a year not "closed," section 734 does not apply, but the Commissioner will assess, as income taxes, deficiencies for the prior year; and when such a deficiency is paid with interest, the taxpayer has a right to deduct the interest in computing his excess-profits net income.

There is no reason or logic in permitting deduction of interest paid on a deficiency for an "open" year and denying the deduction of interest paid on a deficiency for a "closed" year. We hope and believe that your experts will agree with this, and will agree that interest paid as a result of adjustments under section 734 should be a deductible item for the taxpayer.

It is difficult for me to say just where in the act the amendment should go and the wording for it. We think the committee should ask the drafting experts to draw the proper amendment or amendments to this effect:

Interest paid as a part of, and as a result of, adjustments made under section 734 is a deductible item in ascertaining excess-profits net income.

If the deduction is to be allowed in the year in the excess-profits tax return of which the adjustment is made, the amendment should be retroactive, because almost all adjustments to be made under section 734 will have been made in the 1940 returns.

CAPITAL STOCK TAX

Permission should be given taxpayers to make a new declaration of capital-stock valuation in 1942 and 1943—either up or down

As Judge Fletcher, appearing for the railroads, told this committee on August 13, declarations of capital-stock value are left entirely to the taxpayers. The capital-stock tax, together with the accompanying declared value excess-profits tax, are deliberately framed so as to force the taxpayer to declare enough value for the capital-stock tax to protect himself from incidence of the declared excess-profits tax. Prior to 1939, the taxpayer had to estimate what his earnings would be during each of the next 3 years. In 1939 taxpayers were given the privilege of raising, in 1939 and 1940, the value declared by them in 1938. The House bill permits no such adjustment to be made in values declared in 1941.

We submit that the state of the country, the uncertainty as to what will happen in the next few years, the impossibility of guessing the next 3 years in advance, are now such that it is unfair to the taxpayer to force him to make such a guess. Quite generally, 1941 will be a high-income year. With possible termination of the war in 1942 or 1943, all profits may disappear, and the taxpayer, unless given opportunity to redeclare capital-stock value, may be paying, out of capital, taxes on a wholly arbitrary and grossly exaggerated value, declared by him in 1941 to protect himself from declared value excess-profits tax on his 1941 income. On the other hand, profits may continue to grow beyond all reasonable expectation by reason of inflation, and the taxpayer may find himself with a declared value in 1942 or 1943 wholly inadequate to protect himself from the excess-profits tax. It may be all right in ordinary times to force the taxpayer to guess 3

years in advance what his profits will be each year, but in times such as these, when nobody can possibly tell what is going to happen, it is extremely unfair to hold a taxpayer to a declared value for 3 years, during which anything can happen. He should be permitted to make new declarations in 1942 and 1943, up or down.

Respectfully submitted.

A. W. CLAPP.

The CHAIRMAN. I will offer for the record a letter from Senator McCarran with reference to the elimination by the House of section 731 of the Internal Revenue Code, which has the effect of exempting from excess-profits taxes income derived from the mining of certain strategic metals.

Senator McCarran was here but he was not here at the opening of the hearing this morning, and he desires this letter, which is in the nature of a brief, together with other accompanying documents, inserted in the record.

The committee is pleased to get his personal appearance and to enter into the record his position in regard to the elimination of section 731 of the Internal Revenue Act.

(The material submitted by Senator McCarran is as follows:)

UNITED STATES SENATE,
August 6, 1941.

Hon. WALTER F. GEORGE,
Chairman, Finance Committee,
United States Senate, Washington, D. C.

MY DEAR SENATOR GEORGE: You will recall that we were successful in having included in the Second Revenue Act of 1940 what is now known as section 731 of the Internal Revenue Code. Section 731 exempts from the provisions of the excess-profits tax, income derived from the mining of certain strategic metals.

As you doubtless know, the pending tax measure, H. R. 5417, contains a provision (sec. 206) expressly limiting the effect of section 731 of the Internal Revenue Code to the tax year 1940, and making it inoperative for subsequent tax years. In my judgment the pending provision would deliver a serious blow to the mining industry and, in turn, to the national defense of this country by impairing strategic metals mining activity.

At the hazard of being presumptuous, may I take this opportunity to draw to the attention of your honorable committee what I believe are some cogent reasons for at least a restoration of the provisions of the 1940 Revenue Act which, in my opinion, only rendered partial justice to the mining industry.

The excess-profits-tax provisions permit of two methods as the basis for the ascertainment of what constitutes excess profits, with some adjustments which are not necessary to enumerate, i. e.:

1. It taxes as excess profits anything in excess of an 8-percent return on invested capital; or

2. The income basis measured by the average earnings for the years beginning December 31, 1935, and ending December 31, 1939.

If a corporation was not in existence during the entire 48 months of the base period, it is awarded a constructive net profit income at the rate of 8 percent of the daily invested capital, as of January 1, 1940, and for the remainder of the base period it may average its income. With some adjustments, as stated, the basis for excess profits, therefore, is anything in excess of 8 percent on invested capital, or anything greater than the average of 4 years' profits. Both of these methods are extremely unfair to the mining industry.

As to invested capital.—The invested capital method is unfair for several reasons:

1. Because the small amount of invested capital in a going mine is comparatively small.

2. Because an 8-percent return on capital invested in the mining industry is entirely inadequate, and this is especially true as respects the State of Nevada.

Mining, at best, is an extremely hazardous undertaking involving in most instances a tremendous risk of capital with no assurance of a return on the

investment, much less a profit. The productive life of the average gold or silver, or gold and silver mine having strategic metals byproducts does not exceed 5 years.

There is an old phrase "prospects are found—mines are made," and they are not made in a day or even in a year, and generally not in several years. A discovery is made and this must be followed by considerable exploratory and development work before the mine can come into production. This is especially true of what is called low-grade mines. In all cases sufficient ore must be developed through workings to justify a plant. When sufficient ores have been developed, then the camp, power plant, and other facilities must be erected. This development period, as stated, will run from 1 to 4 years. Generally it may also be said that the first year of production will be comparatively low, increasing with succeeding years as mechanical and metallurgical difficulties are ironed out. As a general rule it is during the third years that normal production is reached.

Neither public nor private financing of mining developments can be done upon a basis of an 8-percent return on invested capital because this means that a mine must have a life of at least 12½ years to repay the capital, and when you take into consideration the normal corporate taxes and the additional taxes levied against the dividends coming to the stockholders, it is clear that only in exceptional circumstances will the investor recover his investment, must less a profit, in a precious-metal mine upon the basis of an 8-percent return.

As to income basis.—The income basis on its face would appear to be fair, but in fact it is extremely discriminatory. Companies which have an earning history for the whole of the base period or longer will pay little or no excess-profits tax. The largest silver mine in the United States and the largest gold mine in the United States, neither of which is in Nevada, because of their earning history, will pay little, if any, excess-profits tax. A penalty, however, is imposed upon new discoveries, new mines, and upon corporations coming into production subsequent to December 1935.

A corporation not in existence during the entire 48 months must take a constructive 8-percent capital return on its investment as of January 1, 1941, for the year or years not in existence and average its earnings for the other years of the base period.

The vice of this lies in the phase "not in existence," and in the practical application of the law. It is given no constructive capital investment or constructive earnings during the time it was in existence but not in production.

The Excess Profits Tax Amendments Act of 1941 amended section 722 of the Internal Revenue Code with respect to abnormal base period earnings. However, for a mining corporation to be entitled to relief under the so-called abnormal earnings section, it must first establish that the character of its business has been changed, or that its normal production was interrupted during one of the taxable base period years due to abnormal events. As a direct consequence, the constructive relief intended to be given by amending section 722 is not available to the mining industry unless it can be established that the character of business has been changed (a thing impossible on its face); or that production was diminished or abandoned during any taxable base period year as a result of abnormal events. The most frequent instances of abnormalities, however, such as an unusual increase in the cost of labor or necessary essential materials, or an extremely low metals price making production highly unprofitable, are not included within the official construction of "occurrence of events abnormal." Thus, the mining industry is effectively precluded from seeking relief under section 722 of the Internal Revenue Code.

In my opinion, a mining corporation should not be liable for excess-profits taxes until it has had a profitable production of at least 3 years and, in any event, the years of existence when it is under development and not in production, should be excluded and it should be permitted to take its average earnings after it comes into production.

Because of the inequitable operation of the excess-profits tax, and realizing that a capacity production in existing strategic metals mines, as well as a constantly accelerating activity in the exploration and development of a strategic-metals deposit is essential and paramount for national defense, Congress wrote into the Second Revenue Act of 1940 section 731 of the Internal Revenue Code. To remove the exempting provisions of 731 at this stage of our domestic development of strategic metals and subject strategic-metals producers to the discriminatory operation of the excess-profits tax would deal a paralyzing blow to our vast development program, and would unnecessarily impair our achievement of complete national defense.

I hope you will pardon my addressing you at such length on this matter. I realize, as I know you must realize, that if our natural resources of strategic metals deposits in the Nation are to be adequately developed, the industry must have every encouragement at our disposal. I do not believe that the Congress should now attempt to tax the mining industry out of existence.

I am opposed to section 206 of the bill H. R. 5417, and I earnestly beseech your honorable committee to strike this section from the bill.

Respectfully,

(Signed) PAT MCCARRAN.

UNITED STATES SENATE, *August 6, 1941.*

HON. PATRICK MCCARRAN,
United States Senate, Washington, D. C.

DEAR SENATOR MCCARRAN: I appreciate receiving your letter with respect to the manner in which the new revenue bill now pending in the Finance Committee will effect the mining industry. I have carefully noted the arguments which you have advanced and find myself in complete agreement with them.

I hope that nothing will be done by the Congress to impede or hinder the mining industry in this pending tax measure. You will have my hearty cooperation to this end.

Sincerely,

ED C. JOHNSON.

UNITED STATES SENATE, *August 8, 1941.*

HON. PAT MCCARRAN,
United States Senator, Washington, D. C.

DEAR SENATOR: I have studied with much care yours of July 31.

I can assure you that it will be a pleasure to join with you in an effort to have section 206 stricken from the proposed new revenue bill.

Sincerely,

DENNIS CHAVEZ,
United States Senator.

UNITED STATES SENATE, *August 6, 1941.*

Hon. PATRICK MCCARRAN,
United States Senate, Washington, D. C.

MY DEAR SENATOR: So far from resenting the length of your letter of August 2, I am very pleased to have such a comprehensive analysis of the probable effect of the provisions of H. R. 5417, to which you call attention, upon the mining industry of our State.

I have read your letter with a great deal of interest, and as you know, I, too, am vitally concerned about this matter.

Sincerely,

BERKELEY L. BUNKER.

UNITED STATES SENATE, *August 8, 1941.*

Hon. PATRICK MCCARRAN,
United States Senate, Washington, D. C.

MY DEAR SENATOR MCCARRAN: You will permit me to acknowledge your letter of August 6 with reference to section 206 of the House revenue bill and to the excess-profits tax as applied to the mining industry.

I assure you that your views will be presented to the committee prior to the filing of the report in the Senate.

Sincerely yours,

WALTER F. GEORGE.

UNITED STATES SENATE, *August 5, 1941.*

Hon. PATRICK MCCARRAN,
United States Senator.

DEAR SENATOR: Your letter of July 31 with regard to excess-profits-tax provisions embodied in H. R. 5417 and their relation to the mining industry of the West has been received during the absence of Senator Murray, who is now in Montana. Your letter will be brought to his attention upon his return to Washington, and I feel sure that he will want to take an active part in the effort to have section 206 stricken from the bill.

Sincerely yours,

W. G. RAGSDALE, *Acting Secretary.*

UNITED STATES SENATE, *August 6, 1941.*

Hon. PATRICK MCCARRAN,
United States Senate, Washington, D. C.

MY DEAR PAT: I thank you for your letter of July 31 with reference to section 731 of the Internal Revenue Code. I shall certainly be glad to do what I can to be helpful in connection with the strategic-minerals exemption.

With kindest personal regards, I am,

Yours very sincerely,

CARL HAYDEN.

UNITED STATES SENATE, *August 7, 1941.*

Hon. PATRICK MCCARRAN,
United States Senate, Washington, D. C.

MY DEAR SENATOR MCCARRAN: As Senator Holman is absent from Washington, I am writing to acknowledge your letter of July 31.

You will note from the attached copy of a wire I have received from Senator Holman that he feels as you do with respect to the elimination of the previous exemption from the excess-profits tax on certain strategic minerals.

Sincerely yours,

ROBERT B. PARKMAN,
Secretary to Senator Holman.

[Telegram]

ROBERT B. PARKMAN, PORTLAND, OREG., *July 24, 1941.*
Secretary, Washington, D. C.:

Referring to elimination of exemption of strategic minerals from excess-profits tax in 1941 House revenue measure—this will prove a catastrophe to development of additional strategic mineral production. This will have an immediate effect in decreased quicksilver and tungsten production and will effectively prohibit development by private capital of any new deposits of chrome, manganese, nickel quicksilver, and tungsten. Since preliminary estimates possible revenue which might be derived from this source could not exceed million and half dollars and probably much less, it would appear that this step by Ways and Means Committee is very short-sighted and exceedingly detrimental to defense program. Since development of strategics involves high-cost production which probably cannot compete after present emergency, private capital must be assured either of possibility of profit or guaranty against loss. Since present Government policy is not to guarantee against loss, elimination of any possible profit will prevent development of strategics by private capital and would require Federal money and Federal supervision and much delay before obtaining any appreciable additional strategic production. The shipping situation is so critical foreign ores cannot be relied upon. This is breach of faith and slap in the face to the very producers whom Government has been trying to encourage to expand strategic-mineral production.

RUFUS C. HOLMAN,
United States Senator from the State of Oregon.

The CHAIRMAN. Mr. Larsen, D. P. Larsen.

STATEMENT OF D. P. LARSEN, MINNEAPOLIS, MINN., VICE PRESIDENT, SHEVLIN, CARPENTER & CLARKE CO.

Mr. LARSEN. I am David P. Larsen, vice president, Shevlin, Carpenter & Clarke Co., of Minneapolis, which manages generally, among other companies, two companies which produce ponderosa pine on the West coast. I have a statement to present with three illustrating tables which I hope may go in the record. I think I can present the matter most concisely by commenting on the matters contained in my prepared statement.

The CHAIRMAN. You may put your statement in the record but we hope you can make your oral statement as brief as possible since the whole brief will be in the record.

Mr. LARSEN. I think I can present the matter in 10 or 15 minutes.

Our informed people realize that they must pay much heavier taxes for, except as Congress limits expenditures, it cannot limit ultimate taxes. The time of collection should be determined by sound finance and a desire not to leave our descendants a mountainous burden of debt. I, therefore, make no objection to the total dollars of taxes proposed to be collected by this bill (H. R. 5417), but to promote equality shall suggest one change in the proposed distribution of the burden.

I shall discuss only section 201 (2) which disregards equality and ability to pay more than any tax provision encountered during the 25 years I, as accountant and auditor, have handled income and excess-profits-tax matters for several corporations in United States and Canada.

I wish to make clear by words and illustrations that the pending bill's section 201 (2) penalizes with an extra 10-percent tax those who for innumerable reasons had subnormal profits in the base period, but fails to apply any excess-profits tax to earnings of others to the extent of their base-period earnings ranging from 8 percent to 44 percent or more of capital. Extreme discrimination results from the arbitrary and erroneous assumption that for all industries earnings were normal from 1936 to 1939, inclusive, and that current earnings above that average represent defense profits. The fact is that during that period corporate earnings were above normal in some cases, normal in others and subnormal for a large part of the total. The year 1936 did not show full recovery from the depression. The year 1937 came the nearest to being normal. A secondary depression made 1938 a very bad year generally. For many businesses (including the lumber business, with which I am most familiar), the low prices and profits continued during 1939. In all of those years the Government took steps to bring business and employment up to normal.

Instead of duplicating statistics already furnished, may I suggest reference to the illuminating figures given the Ways and Means Committee by Mr. Nielson according to pages 1662 to 1669 of the House hearing.

While he proceeded to justify retention of the option to use base period earnings, his figures also prove my contention that in years before the defense effort there was great variation in profit between different years, industries and individual corporations. His figures picture many corporations with such high rates of earnings upon capital that they escape not only the 10-percent special excess-profits tax, but they escape the regular excess-profits tax until they have earned several times the invested capital exemption proposed in this bill. In the four base period years erroneously called normal, 67 companies taken at random varied in earnings from 1.2 percent to 36.7 percent on capital.

The following example illustrates how it is possible under the proposed law for a corporation earning $2,000,0000 in 1941 to pay less than one-half of the excess-profits tax payable by a company having earnings of $850,000, both having the same invested capital:

You will note the invested capital and credit were identical for both companies.

	Company C (beverages)	Company D (lumber)
1. Average invested capital	$10,000,000	$10,000,000
2. Invested-capital credit, 1941	750,000	750,000
3. Average earnings, 1936-39	2,000,000	200,000
4. Average earnings credit, 1941	1,900,000	190,000
5. Earnings for 1941	2,000,000	850,000
6. Amount subject to 10-percent special tax (2 less 4)	None	660,000
7. Amount subject to regular excess-profits tax:		
(5 less 4)	100,000	
(5 less 2)		100,000
8. Regular excess-profits tax on 7	41,500	41,500
9. Special 10-percent tax on 6	None	56,000
Total excess-profits tax	41,500	97,500

Company C on an income of $2,000,000, or 20 percent of invested capital, pays an excess-profits tax of $41,500, while company D, because it has raised its earnings rate from a poor showing of 2 percent to 8½ percent of invested capital pays a tax of $97,500 on an income of only $850,000, whether or not any of the increased income resulted from the defense program. The demand for the product of company C is fairly stable and its profit margin is maintained from year to year. The product of company D is subject to wide fluctuations in volume and its poor showing during the base period is partly due to continuing overhead costs borne by low volume of business.

The adequacy of the exemption from excess-profits tax measured by 7 to 8 percent of invested capital depends on the time and nature of the investment. The probable yield must vary with the risk in order to attract capital. High-risk businesses must be allowed to earn more in good years than those not so hazardous.

I will summarize the situation of the lumber-producing industry partly to illustrate its hazardous nature and its low and varying profits and partly to disclose a weakness in the proposed bill which, if continually applied to such a wasting asset industry, would gradually eliminate its earnings base from 1936 to 1939, inclusive, long before the operation ceased because of exhausting the timber. First, I refer you to table B, which is the next to the last sheet before you, and which summarizes gross and net profit for lumber and timber products industries as compiled by the Treasury Department from income returns. The net income percentages shown are of gross income, not of invested capital. Such data from 1926 to 1934 appeared in table 23 of exhibit 47, *Ex parte No. 123*, before the Interstate Commerce Commission, December 9, 1937. The subsequent 5 years were obtained from the same Government source. The witness, Wilson Compton, president of National Lumber Manufacturers Association, summed up the situation on page 12 of that exhibit in these words:

> As to the ability of the lumber industry to absorb additional costs of transportation of its products, may I cite the only conclusive information available in the statistics of income reported by the Bureau of Internal Revenue. This, in table 23, shows for the sawmills and planing mills, during the period from 1926 to 1934 a net income during 4 years ranging from less than 1 percent to about 3 percent of the gross income, followed by an unbroken 5-year period of deficit ranging from 7 to 32 percent of the gross income, with a total net result for the 9-year period of a deficit equivalent to 3 percent of total gross income. As a companion in deficits, the lumber industry seems to have outranked even the railroads.

Generally speaking, lumber production is like the long-term liquidation of a crop. Sufficient timber is usually purchased or otherwise assured to warrant the construction of plant facilities. The heaviest part of the investment may be made long before profits begin. Timber is subject to destruction by fire but is not insurable against that hazard. With the liquidation of timber and amortization of plant some gain or loss accompanies the return of capital. Other things being equal, the invested capital declines per dollar of profit with passage of time so that an operation nearing its close has normal volume of shipments, subnormal capital, and higher yield in relation to capital.

The business is extremely competitive, as its nature prevents ready adjustment to subnormal volume especially of property carrying cost and other overhead. Those producing lumber mainly for home build-

ing, such as western pine, are affected by the widely fluctuating volume of home building. This is confirmed by table C, which is the last sheet before you. The earnings, like the consumption, usually vary in cycles of several years each. When the volume of home building and other consumption is good in relation to the overhead burden, then the producers must earn enough to carry them through the inevitable lean years which follow. That many have been unable to do this is evidenced by notable receiverships and default in obligations. Normalcy was not measured by results from 1936 to 1939, inclusive, nor can it be measured by a few other years. Of course, there is great variation between individual sawmills in the same year, depending upon local situations, for this business is seriously affected by weather and by the kind, quality, and location of the timber converted into lumber in any year.

I have verified the following figures covering a large western-pine operation, which, after accumulating a comfortable surplus, showed the following results for the past 12 years:

Labor paid	$15,483,480
Federal income tax	396,582
Other direct taxes	1,400,790
Total taxes	1,797,372
Net profit after income tax	373,304
Cash dividends paid	2,138,755

Of course, the reason Federal income tax exceeded the net profit after income tax was that the corporation paid tax when it had income but obtained no refund or offset after it had losses. The recent provision for carrying 2 years' losses forward against income is insufficient where losses continue for more than 2 successive years. For the western-pine operation referred to, labor cost is about 54 percent of total cost. It is well known that the lumber industry is a large employer of labor, and no argument is needed to emphasize the importance of leaving sufficient earnings to that industry in good years to permit continued operation and employment in such lean years as have always followed the good ones.

In 1918 the World War excess-profits tax of 30 percent applied to the earnings which ranged from 8 to 20 percent of invested capital, above which the tax was 65 percent. A higher rate of war-profits tax applied after the exemption determined by the higher of (1) pre-war income or (2) 10 percent of invested capital. However, the normal tax rate was then 12 percent compared with the 30 percent now proposed. In a business so hazardous and unstable as the lumber industry, we cannot label as excessive exemption the 7- to 8-percent credit upon invested capital, which Ways and Means Committee said on page 24 of its report was equivalent to 4.9- to 5.6-percent credit after deducting normal tax and surtax. Persons familiar with business and investment will agree those rates are low in relation to average risk and too low for many kinds. Is it just to renege on that exemption from excess-profits tax to the extent of an extra 10-percent tax on the excess of that allowance over the poor and subnormal base-period years?

The last question is inseparable from a provision in section 713 (a) (1) (C) for reduction of base period income as invested capital is

reduced. As already stated, it is in the nature of timber liquidation to repay investors the capital plus any net earnings with the gradual cutting of the timber. The average earnings credit is reduced by 6 percent of amounts paid in retirement of capital stock. These reductions increase the amount subject to the 10-percent tax, so long as the invested capital credit exceeds the earnings subject to excess-profits tax.

Added to 30-percent normal tax, the extra 10-percent tax becomes serious since it falls most heavily upon those who earned the least in the base period in relation to invested capital credit or current earnings. That is best illustrated by table A, which is the second from the last sheet before you. The worst tax is that which gives one competitor an advantage over another and this tax helps the one who earned the most in the base period to eliminate the competitor who then earned the least. The total tax burden is extremely heavy as most States collect taxes upon corporate income besides which corporations bear other heavy direct and indirect taxes. Unstable businesses which have long cycles of gain or loss must accumulate surplus in good years to permit operation and employment in lean years. To erroneously assume that four arbitrarily selected years were normal and that all profit increases thereafter were excess profits and deserving of penalty taxes is to do the gravest kind of injustice. It would be impracticable to correct that by relief provisions because thousands of things cause variation of profits between years, including weather, accidents, and dislocation of economic and human relationships.

The 10 percent penalty tax further increases the tax upon corporate income which individual stockholders absorb before they bear the full individual tax rates upon dividends received. That violation of equity and ability to pay is borne by poor and rich stockholders alike in proportion to their holdings. Nevertheless, taxing of corporate income has become such an important part of tax collection that it appears impracticable to now eliminate duplicate tax upon investors' income, levied both when it is earned by the corporation and when it is received by the stockholders.

In effect, section 201 (2) of the bill levies an extra 10-percent tax on what will undoubtedly be the major part of earnings of those taxpayers who during the base period realized poor earnings in relation to their invested capital.

Senator WALSH. I don't want to interfere with your presentation, but I think you sum up your whole case admirably on page 10. The balance is in the record.

Mr. LARSEN. Yes; I intend to skip page 9 and come to the conclusion.

Others who were more fortunate in their base-period earnings are in effect exempted at higher rates upon invested capital or by the still higher rate of base-period earnings.

You were advised by representatives of the Treasury that many corporations which are the principal beneficiaries of the defense effort, and whose 1940 profits were many times larger than in any base-period year, paid little or no excess-profits tax; also, that "the Treasury recommended, and the bill provides, that a flat 10 percent should be applied in such cases to that part of the current profits that exceeds the base-period earnings but does not exceed the invested-capital credit." Such a tax exempts those taxpayers whose profits were above normal in the base period and penalizes those taxpayers who had what was de-

scribed as "especially poor earnings during the base period," on page 1338 of the report of the hearings before the Ways and Means Committee. The same report, on page 1335, records that the Treasury representative emphasized the fact that however severe the tax burdens may have to be they should rest fairly and justly upon all individuals and all businesses. That principle should govern. But, in justification of the proposal to which I take exception, the following was said, according to page 1336 of the report of that hearing:

> In many cases it is not possible to identify with precision the additional profits due to the defense program. The effects of defense spending are diffused throughout the whole economic system. It is necessary, accordingly, to assume that, in general, increases in profits during this period are due to defense. Inability to measure defense profits precisely should not discourage us from subjecting them to special taxation even at the risk of hitting some income not derived from the defense program.

Because some defense profit is included in the current income of some corporations, whose base-period income was below the 7 to 8 percent invested-capital credit, does not justify the imposition of a 10-percent-penalty tax on all profit above subnormal base-period years of other taxpayers. If time does not permit the working out of a bill which would fairly and equitably segregate and subject to a special tax the defense profit not otherwise subject to excess-profits tax, it would be fairer to raise the additional revenue needed by raising taxes of individuals or increasing regular excess-profits-tax rates rather than to penalize those whose earnings, due to conditions beyond their control, were below 7 or 8 percent of invested capital.

The lumber industry, with which I have become thoroughly familiar while employed in it during more than the last 25 years, will be unjustly discriminated against if section 201 (2) as it passed the House of Representatives is enacted into law. On much of its current income it will pay an extra 10-percent tax merely because it suffered from subnormal earnings during the base-period years, and, therefore, will be denied the full exemption on its capital which the law allows except for the unjust proposal in section 201 (2).

I sum up the objections stated to the new 10-percent tax proposed in section 201 (2) as follows:

1. Statistics cited prove great variation in profits between years, industries, and companies before the 1940 defense program. The profit variation due to each of the innumerable reasons for such variation cannot be measured so as to adjust to normal what was not normal in the base period. The assumptions that the base period was normal and that earnings above that level are excess or defense profits are so incorrect as to justify exemption from excess-profits tax measured by either the invested capital credit or base-period earnings.

2. Inability to identify indirect-defense profits should not subject nondefense profits to excess-profits tax except as they exceed both of the optional exemptions.

3. The inequity of the excess-profits tax should not be increased by applying an extra 10-percent tax on the amount by which invested capital credit exceeded subnormal earnings in the base period. The exemption based upon invested capital is so low in relation to busi-

ness hazards, and in relation to those using base-period earnings, that such capital exemption should not carry a penalty tax.

4. The provisions for reducing base-period income by capital reductions have unreasonable application to wasting asset industries unless section 201 (2) is eliminated.

For the reasons stated I urge elimination of paragraphs (2) and (3) of section 201 in order to avoid the extreme and unnecessary discrimination therein provided.

The CHAIRMAN. Any questions by any member of the committee? If not, Mr. Larsen, we thank you for your appearance. Your whole brief is in the record.

(The tables referred to by Mr. Larsen are as follows:)

TABLE A.—*Illustrating how the 10-percent tax proposed in section 201 (2) discriminates against corporations having subnormal income in the base period*

To simplify illustration of tax discrimination resulting from the special 10-percent tax proposed, assume the following:

(1) Two corporations compete in the same line of business in the same State.

(2) Both companies had the same invested capital in the base period as well as in 1941.

(3) In 1940 both companies had income subject to excess profits, so there was no unused excess-profits tax credit.

(4) Both corporations had taxable income of $600,000 in 1941.

(5) Base period net income was:

	Corporation A	Corporation B
1936	$100,000	$300,000
1937	200,000	600,000
1938	100,000	100,000
1939	200,000	400,000
4 years	600,000	1,400,000
Average	150,000	350,000
	Percent	*Percent*
Average earned on capital	3	7

The reasons for A's lower income in base period were: 1936, heavy snowfall curtailed but did not stop production. 1937, lower than average grade of natural resource was converted and sold. 1939, longer haul of natural resource to factory.

Those differences between A and B reduced the earnings of A below normal (or true average) but the resulting tax disadvantage to A in 1941 would not be relieved by such provisions as section 722 (2) of Internal Revenue Code.

The normal tax and graduated excess-profits tax would be the same in 1941 for the two corporations. The 10 percent proposed by section 201 (2) would be five times as much for A as for B, according to the following computation:

	Corporation A	Corporation B
Invested capital for 1941	$5,000,000	$5,000,000
	Percent	*Percent*
Average earned on capital in base period	3	7
Capital for 1941 multiplied by rate earned in base period	$150,000	$350,000
Excess-profits credit based on current capital—8 percent of $5,000,000	400,000	400,000
The latter exceeds the former by	250,000	50,000
On which the 10 percent special tax is	25,000	5,000

TABLE B.—*Sawmills and planing mills, per income returns*

Corporations reporting net income—	Number of returns	Gross income	Net income	Percent net of gross income
1926	2,104	$1,256,708,000	$96,920,000	7.71
1927	1,769	934,595,000	62,233,000	6.66
1928	1,934	1,014,746,000	70,798,000	6.98
1929	1,876	991,829,000	70,940,000	7.15
1930	940	303,198,000	16,572,000	5.47
1931	507	83,506,000	2,981,000	3.57
1932	186	21,379,000	722,000	3.38
1933	582	131,293,000	6,058,000	4.61
1934	734	170,029,000	9,776,000	5.55
1935	1,024	309,415,000	16,020,000	5.18
1936	1,321	541,342,000	39,493,000	7.30
1937	1,362	679,522,000	52,674,000	7.75
1938	1,029	385,220,000	19,951,000	5.18
1939	1,297	617,338,000	38,288,000	6.20

Corporations reporting no net income—	Number of returns	Gross income	Loss	Percent loss of gross income
1926	1,726	$472,860,000	$46,267,000	9.78
1927	1,683	545,309,000	56,540,000	10.37
1928	1,597	464,710,000	45,817,000	9.86
1929	1,646	472,296,000	38,580,000	8.17
1930	2,425	734,968,000	89,326,000	12.15
1931	2,493	535,650,000	121,867,000	22.75
1932	2,633	363,448,000	124,803,000	34.34
1933	2,252	321,408,000	51,885,000	16.14
1934	2,081	320,208,000	47,431,000	14.81
1935	1,915	310,070,000	34,614,000	11.16
1936	1,449	262,295,000	24,426,000	9.31
1937	1,428	259,740,000	14,085,000	5.42
1938	1,908	368,463,000	32,362,000	8.78
1939	1,552	307,070,000	20,888,000	6.80

All corporations reporting (combined)—	Number of returns	Gross income	Net income or loss	Percent net income or loss of gross income
1926	3,830	$1,729,568,000	$50,653,000	2.93
1927	3,627	1,479,904,000	6,693,000	.38
1928	3,718	1,479,456,000	24,980,000	1.69
1929	3,768	1,464,125,000	32,360,000	2.21
1930	3,551	1,038,166,000	[1] 72,753,000	[1] 7.01
1931	3,168	619,146,000	[1] 118,886,000	[1] 19.20
1932	2,946	384,829,000	[1] 124,081,000	[1] 32.24

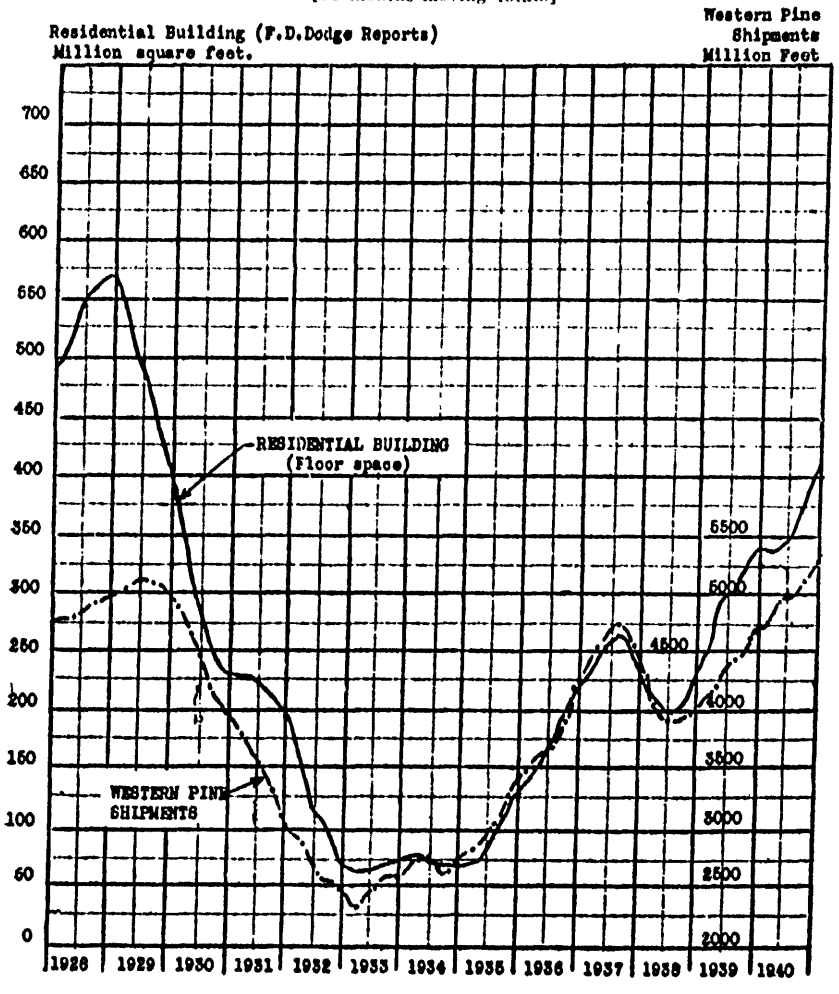
TABLE C.—*Trend of residential building and western-pine shipments*

[12 months moving totals]



The CHAIRMAN. Professor Fairchild?

Mr. ALVORD. Mr. Chairman, I would like, if I may, to make a preliminary statement. The committee on Federal finance, United States Chamber of Commerce, will be represented by three witnesses, among whom the testimony has been divided.

Professor Fairchild, of Yale University, who will discuss Federal expenditures and principles of taxation; Mr. Roy Osgood, of Chicago, who will discuss the proposed changes in the estate and gift taxes of the House bill, and I will discuss the House bill and our recommendations with respect thereto.

Written statements have been prepared by each of us, and I ask that these written statements be incorporaed in the record.

The CHAIRMAN. The briefs will be entered in the record. You say Professor Fairchild will proceed first?

Mr. ALVORD. Yes.

STATEMENT OF PROF. FRED R. FAIRCHILD, NEW HAVEN, CONN., MEMBER OF THE COMMITTEE ON FEDERAL FINANCE OF THE CHAMBER OF COMMERCE OF THE UNITED STATES

Professor FAIRCHILD. My name is Fred R. Fairchild. I am professor of economics of Yale University. I am a member of the committee on Federal finance, Chamber of Commerce of the United States. I believe the members of the committee have before them now the typewritten statement of the testimony I propose to give. On the first page there appears an outline which is followed throughout the statement and which I shall follow in my presentation in order to trench as little as possible on your time. I propose to follow in my spoken argument rather closely the typewritten statement which you have before you.

I. *Amount of taxes in relation to expenditures.*—Few will differ with the idea that the Federal Government should obtain substantial additional revenues to meet the enlarged defense expenditures. Our chamber committee advocates additional taxation, although, as will appear from subsequent testimony, it makes a somewhat different approach to the problem from that of the House bill.

1. *Ratio of taxes to borrowing.*—We do not believe it is feasible to set up an automatic "measuring stick" of the amount of revenues which should be obtained. The amount depends upon such factors as the total of expenditures, the probable national income, its distribution, the sources and methods of taxation used, and the impacts of the new and increased levies upon the national economy. No exact ratio of taxes to total expenditures has any validity in and of itself. It is evident that the two-thirds formula is not realizable for the fiscal year 1942, and its feasibility with respect to 1943 is at least open to question.

2. *Determining the amount of taxes.*—On the contrary, the practical method in such an emergency as the present is: (1) Determine the amount of nondefense expenditures at the lowest practicable level, (2) estimate as nearly as may be the sum of defense expenditures, (3) settle upon a tax program that will produce the maximum revenue possible without impairment of the economic and political structure, and (4) depend upon borrowing for the balance.

I am assuming that the maximum levies under the conditions stated would still, under present conditions, not be sufficient to produce all necessary revenue and that some degree of borrowing would be necessary.
