- [2] For the purpose of sorting tax returns by income, equivalized income accounts for the size of a tax unit by dividing the measure of income by the square root of the number of individuals in the tax unit. Income is measured as adjusted gross income ("AGI") plus (1) tax-exempt interest, (2) employer contributions for health plans and life insurance, (3) employer share of FICA tax, (4) workers' compensation, (5) nontaxable Social Security benefits, (6) insurance value of Medicare benefits, (7) alternative minimum tax preference items, (8) individual share of business taxes, and (9) excluded income of U.S. citizens living abroad. Equivalized income is used for sorting only and does not affect income or tax liabilities elsewhere in this analysis. Details are presented for taxpayers sorted into quintiles, each containing a fifth of all tax units, with the highest income quintile further sorted into smaller percentile groups.
- [3] Federal taxes are equal to individual income tax (including the outlay portion of refundable credits), employment tax (attributed to employees), excise taxes (attributed to consumers), and corporate income taxes. The estimates of Federal taxes are preliminary and subject to change.

[4] The average tax rate is equal to Federal taxes described in footnote [3] divided by income described in footnote [2].

[5] For returns in the lowest equivalized income quintile, Federal taxes would decrease from -\$11.654 billion to -\$14.746 billion.

[1] The population of taxpayers represented includes nonfiling taxpayers, and excludes individuals who are dependents of other taxpayers, and taxpayers with negative income.

[2] Equivalized income accounts for the size of a tax unit by dividing the measure of income by the square root of the number of individuals in the tax unit. Income is measured as adjusted gross income ("AGI") plus (1) tax-exempt interest, (2) employer contributions for health plans and life insurance, (3) employer share of FICA tax, (4) workers' compensation, (5) nontaxable Social Security benefits, (6) insurance value of Medicare benefits, (7) alternative minimum tax preference items, (8) individual share of business taxes, and (9) excluded income of U.S. citizens living abroad. In distributional analysis, equivalized income is used for sorting only and does not affect income or tax liabilities elsewhere in the analysis. Percentile values of equivalized income are rounded to the nearest \$100 in the table.

Because a tax unit's equivalized income is the tax unit's income divided by the square root of the number of individuals in the tax unit, increasing the number of individuals while holding income fixed reduces equivalized income, though the rate of reduction declines with each additional individual, reflecting economies of scale in consumption for larger tax units. For example, with \$100,000 in income, a tax unit with a single individual has equivalized income of \$100,000 $\div \sqrt{1}$, with two individuals has an equivalized income of \$70,711 (\$100,000 $\div \sqrt{2}$), with three individuals has an equivalized income of \$57,735 (\$100,000 $\div \sqrt{3}$), and with four individuals has an equivalized income of \$50,000 (\$100,000 $\div \sqrt{4}$). As the number of individuals increases, the reduction from income to equivalized income declines: the second individual reduces equivalized income by \$29,289 (\$100,000 less \$70,711), the third individual by \$12,976, and the fourth individual by \$7,735. In 2027, a tax unit with \$100,000 in income and a single individual is in the fourth quintile (between the 60th and 80th percentiles) of equivalized income while tax units with the same income and two to four individuals are in the third quintile (between the 40th and 60th percentiles).
